

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

A Trade Paper Giving the World's Motor News

Vol. XXXIII
No. 1

New York, September 26, 1912

Ten cents a copy
Two dollars a year

"DISCO"

REG. U.S. PAT. OFFICE

Two Pillars of Strength to the Sales Force

No other one new feature closed more sales the past season than the DISCO equipment. The Disco Starter and Disco Lighter will make sales for you this year—the absence of these will give the advantage to your competitor.

The DISCO Marks the Leader of Each Class

America's Progressive manufacturers select the DISCO. Here are some that have already contracted for 1913:

Locomobile	**Simplex**	**Selden**	**Republic**
Pierce-Arrow	**American**	**Buick**	**Davis**
Packard	**Marion**	**Havers**	**Pilot**
Stevens-Duryea	**Henderson**	**Jackson**	**McLaughlin**

The motorist who knows demands the DISCO—the dealer who knows demands the DISCO—the manufacturer who knows puts it on his cars.

The new model "16" DISCO—as far ahead of the first DISCO models as the Disco has ever been ahead of all others—weighs less than four pounds, has but 12 parts, and is quickly fitted to any car. It sells at $30 for a 4-cylinder car —$35 for a six. Let us quote you terms and prices.

IGNITION STARTER COMPANY 715 Dodge Building DETROIT, MICHIGAN

A BIG OPPORTUNITY There is some good territory still open for 1913, and we want to hear from live agents and dealers. Write us today.

Published Weekly by The Motor World Publishing Company, 1600 Broadway, New York

27 Manufacturers equip their cars with the

Truffault-Hartford SHOCK ABSORBER

Is the car YOU sell likewise equipped?

The manufacturers of 27 leading cars equip their product with the Truffault-Hartford—at the factory.

These farsighted manufacturers recognize the real and widespread demand for this device —on the part of owners—everywhere. They know—as experts—how Truffault-Hartford equipment adds to the selling value of their cars—how it promotes car-efficiency—insures maximum riding comfort—and reduces the cost of upkeep.

Does the car YOU sell enjoy the advantage of Truffault-Hartford equipment?

Through our comprehensive advertising campaigns, car owners have learned why Truffault-Hartford equipment belongs on the car they should buy. And YOU—as an elert, progressive dealer—should insist that the car YOU sell has this device as regular factory equipment.

We would be pleased to communicate further with dealers who want to know more about the Truffault-Hartford.

Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

Price $1.00 Each
Ready for Delivery Now

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers and the dealers, or

Here Is The Car We've Promised You

EQUIPMENT: Disco self-starter; Prest-O-Lite tank; Dynamo electric lighting system, all lamps; Warner speedometer; Q. D. demountable rims, one extra; Ventilating plate glass windshield; 80-hour storage battery; Mohair top, boot, storm curtains; Tire irons; Concealed tool boxes; Robe rail; Foot rest; Tools, pump, jack, tire kit.

BODY: Five passenger, big and roomy; graceful lines, flush sides; divided front seats; deep upholstering, hand-buffed leather; center control; all doors open towards front; deep cowl over dash; gasolene filler tube between front seats.

FINISH: Rich brewster green or deep wine color; metal trimmings nickel plated; wood trimmings mahogany; lamps black enameled; fenders, hood, dust shields baked enamel.

MOTOR: Four cylinders, long stroke, cast in pairs; bore and stroke 4 x 5 inches; horsepower 30-40; large valves, valve springs enclosed; automatic carburetor, steering column adjustment; dual ignition, magneto and batteries; 3-point suspension; constant level oiling system (circulating).

CHASSIS: Wheelbase 112 inches; pressed steel frame; cone clutch, spring inserts; 3 forward speed transmission, selective type; shaft drive; front axle I-beam drop forging, rear axle double trussed; front springs semi-elliptic, rear ¾-elliptic, imported steel; four double acting brakes, large and effective; strong steering gear; artillery wheels; 34 x 4 inch tires.

Features such as these establish the Marion 37-A as a car of unusual value at such a moderate price. Write for further information, illustrated, about this car.

To automobile dealers we offer the fairest sales agreement ever written. Ask about territory.

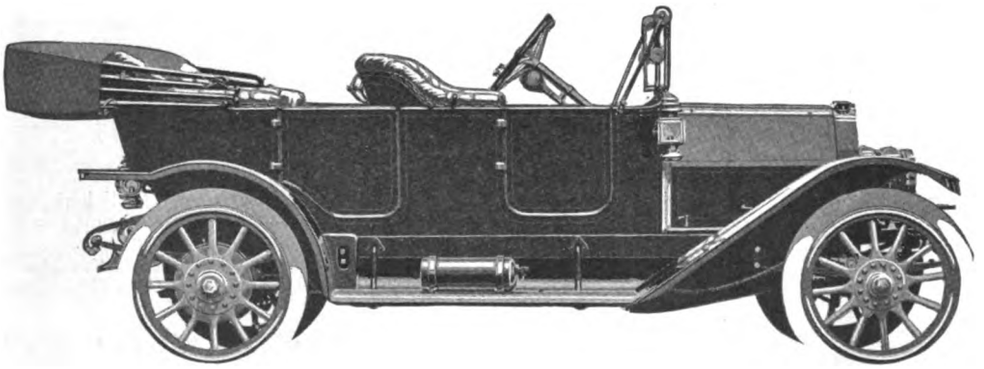
Overland 1913

$985



Completely Equipped

Result of a 40,000 Car Production

Self Starter	*Remy Magneto*
30 Horsepower	*Warner Speedometer*
5-Passenger Touring Car	*Mohair Top and Boot*
110-inch Wheel Base	*Clear Vision Wind Shield*
Timken Bearings	*Prestolite Tank*
Center Control	

¶ Just as startling as the modern automobile was, 10 years ago, in this Overland value for 1913. We seek nor need no descriptive phrases to praise it. The most casual examination can not fail to convince you of the unusual worth. Think of a 95 per cent. efficient factory making 40,000 cars in one season. Just ponder over that number; conceive of the economies to be practiced in such production. That is why, that when you buy an Overland Model 69 T you get it at what would be a wholesale price in another line. Let us mail a 1913 catalogue of particulars. Please address Dept. 50.

SCHRADER TO ACQUIRE TWITCHELL'S PATENT

Transaction Practically is Consummated and Will Terminate Two Suits —Will Broaden Schrader's Scope—License for Allen.

Unless a hitch should develop at the eleventh hour and fifty-ninth minute, of which there is practically no possibility, the suits of C. R. Twitchell and the Twitchell Gauge Co., of Chicago, against A. Schrader's Son, Inc., and the Allen Auto Specialty Co., of New York, never will come to trial.

The suits, which are of a number instituted by the Twitchell people, allege infringement of the C. R. Twitchell pressure tire gauge, covered by patent No. 927,-28, dated July 6, 1909, and as the Schrader gauge differs markedly and as the Schrader interests were known to possess patents issued some ten years prior to the Twitchell grant, it was generally expected that the litigation would be fought to a finish. The Twitchell company has been particularly active in asserting its claims in all directions, however, and a favorable opportunity presenting, and favorable terms being offered, A. Schrader's Son has practically consummated the purchase of the Twitchell patent, and thereby put an end to the legal proceedings. The papers in the transaction are all but signed, sealed and delivered.

Although the Schrader gauge differs in construction from the Twitchell type, the latter is more nearly approached by the Allen device, as is the case with several other pressure gauges. It is understood, however, that the Schrader and Allen interests are on such terms of amity that a license to operate under the Twitchell patent will be granted when the rights are acquired by Schrader's Son. The purchase of the patent, therefore, will strengthen the Schrader position and extend its scope to such an extent that it is stated that suits for infringement shortly will be instituted against several manufacturers of such gauges.

Grabowsky "Sacrifice" Case Goes Over.

The motion of John C. Kimble, a stockholder, for the appointment of a receiver for the Grabowsky Power Wagon Co., of Detroit, as a means of preventing the contemplated sale of the property by the creditors' committee which was due for a hearing in the Wayne County Chancery Court in that city on the 19th inst., went over until the 26th. Kimble, as exclusively stated in last week's Motor World, alleged that the creditors' committee of seven, who were constituted voting trustees and who have conducted the Grabowsky company for several months, had not properly conserved the interests of the stockholders and were preparing to sacrifice the property.

Kissel Center Shifted to Milwaukee.

To facilitate its operations and increase its output, the Kissel Motor Car Co., of Hartford, Wis., has acquired a plant in Milwaukee, which will be conducted in addition to the factory in Hartford. The Milwaukee building covers 200,000 square feet of floor space and will permit of a doubling of the output of Kissel cars. The general offices of the Kissel company also will be removed to Milwaukee.

Everitt Formally Adopts Flanders Name.

Formal notice of change of the Everitt Motor Car Co.'s name to Flanders Motor Co. has been filed with the Secretary of State of Delaware, in which state the Detroit company is incorporated. At the same time, a certificate of increase of capital from $3,000,000 to $3,750,000 also was filed.

PALMER & SINGER MAKE THEIR PEACE WITH DYER

They Recognize His Transmission Patent and Are Granted a License—Minor Suit in Process of Settlement.

Following the settlement a month ago whereby the Board of Trade secured licenses under the Dyer transmission patents and ended a long legal fight, the Palmer & Singer Mfg. Co., of Long Island City, N. Y., also has made its peace and has become a licensee under two of the Dyer patents, Nos. 885,986 and 921,963, thus ending litigation which had been pending some two years in the United States District Court for the Southern District of New York, and concluding practically all of the suits brought by the Enterprize Automobile Co. against automobile manufacturers in its fight for recognition of the Dyer grants. The Palmer & Singer peace was concluded Thursday night, 19th inst., when signed copies of the papers were exchanged.

The terms are what the Enterprize people call "the usual license rate," which is one-tenth of one per cent. At this rate every time the Palmer & Singer company sells a model for $2,000 $2 will go into the treasury of the Enterprize concern, which consists largely of Leonard H. Dyer, a New York attorney and the inventor of the devices. Settlement also was made of claims of past damages.

The present settlement does not, however, terminate all of the differences between Palmer & Singer and Dyer, for there still is pending in the Federal court in Brooklyn a suit over other Dyer claims. Negotiations looking toward settlement are in progress, however, and they probably

Digitized by Google

will be consummated within a week or ten days. The Brooklyn suit is over patent No. 657,650, which covers a gear shift H-plate; this patent is one of the group of five under which the Board of Trade's predecessor, the Association of Licensed Automobile Manufacturers, held rights.

Palmer & Singer's position throughout the Dyer suits has been that of an outsider so far as the organized manufacturers have been concerned. When the Association of Licensed Automobile Manufacturers held the Selden patent and also rights under five of the earlier Dyer patents, Palmer & Singer was a Selden licensee only, and when Dyer began his suits, Palmer & Singer, not being a member of the A. L. A. M., fought alone.

New Yorkers to Exploit Foreign Engine.

For the purpose of exploiting a new type of imported internal combustion engine which is said to bear a slight resemblance to the Knight engine, and for which the American rights have been obtained, the Motor and Gear Improvement Co., of New York, has been incorporated under the laws of New York state with an authorized capital of $1,250,000. Among the incorporators are Henry C. Derham, 2d, and Dwight Partridge, both of whom are intimately connected with the Aristos Co., of 250 West 54th street, New York City, of which company Partridge is the secretary. Although their names do not appear among the incorporators, it is understood that Lewis B. Brown, who is vice-president of the Aristos Co., Ralph Pulitzer, the head of the New York World, and John T. Pratt also are financially interested in the venture. At the office of the Aristos company it was said that Brown was out of town and Partridge declared the time was not quite ripe to divulge information regarding the project.

Durant's Company Secures Randolph Plant.

The Sterling Motor Co., of Flint, Mich., which recently was organized with authorized capital of $300,000 by W. C. Durant and his associates, has acquired the factory building in that city, now occupied by the Randolph Motor Co., which manufactures the truck of that name. The plant will be used for the production of engines for the popular priced six-cylinder car which the Little Motor Car Co., of Flint. has in mind. Its factory having been sold over its head, so to speak, the Randolph company has been put to it to find a new location. It prefers to remain in Flint and the board of trade of that city is lending its assistance to that end, but if a suitable plant is not acquired, the Randolph company necessarily will move to some other location.

INTERNAL DISSENTION UPSETS OMAHA COMPANY

Its President Haled to Court for Check Transaction and Charges Fly Thick and Fast—Stockholders at Odds.

Despite the promise which attended the inauguration, less than a year ago, of Nebraska's only automobile manufacturer, the Omaha Motor Car Co., by David W. Henry, already it is badly racked by internal dissention.

Henry, who is one of the veterans of the automobile industry and who played parts in the organization, successively, of the Inter-State and Colby companies, declares that all of the turmoil grows out of an attempt on his part to oust certain men from the company, among them W. A. Gordon and W. L. Huffman, preliminary to a reorganization of its affairs. However that may be, the trouble took an acute turn last week, when Henry, who is president of the Omaha Motor Car Co., was bound over to the district court on a charge of obtaining money under false pretense preferred by Gordon, a former officer and stockholder of the Omaha company, who also is president of the Gordon Warehouse & Van Co., of that city.

According to Gordon's complaint, Henry, on July 3d last, asked him to cash a check for $85, and Gordon, not having the money available, consented instead to exchange the Gordon company's check for Henry's check, which in due course went to protest. Henry admits the transaction, but in court maintained that at the time of the loan he told Gordon he had no money in bank and that he asked Gordon to hold his (Henry's) check until money due him from the Omaha Motor Car Co. had been paid. This was denied by Gordon, who insisted that Henry had represented to him that he had money in the Corn Exchange National Bank, on which his check was drawn, and the court, at any rate, believed the complaint and bound Henry for trial.

Mixed up in the affair is a difference concerning the sale of stock held by Gordon in the Omaha Motor Car Co. He claims he sold it, but Henry maintains that its tranesfer never was recorded.

Universal Cuts Tie to Settle Squabble.

As a result of the litigation in which the Universal Truck Co., of New York, became embroiled, the Universal Motor Truck Co., of Detroit, has resorted to stern measures and has canceled the agency contract and hereafter will conduct its business in New York as a factory branch at 146-150 West 63d street, where its service station is located. The New York company is a separate and distinct corporation and its troubles grew out of the attitude of George Walton, its former treasurer, who claimed he had been "frozen out" and who, only two weeks since, asked for the appointment of a receiver in order to enforce a settlement, which proceeding probably will result in the dissolution of the company. The Universal branch will be in charge of Howard W. Walton, who was the leading spirit in the New York Universal company.

Topics for Sales Managers' Discussion.

There will be no lack of subjects to discuss when the sales managers included in the membership of the Automobile Board of Trade get together on Monday next, 30th inst. The organization's trade committee, of which H. O. Smith is chairman, has outlined the following topics: Selling and Advertising; Territory and Discounts; Annual Model System; Motor Car Equipment; Enclosed Bodies; Freight; Shipping. The sales managers' convention will last two days, their gatherings being held in the Board of Trade offices at 7 East 42d street, New York City.

Tire Core Sued for Advertising Bill.

Charging that the Tire Core Co. of America, which is the metropolitan distributer of Dahl tire filler, has failed to pay the bill for its June advertising in New York and Brooklyn papers, the Wyckoff Advertising Co., of 1743 Broadway, New York City, has brought suit in the New York City Court. The amount asked for is $1,179.86. The defendant's answer is a general denial as to the bill.

Relief for DeTamble Is in Sight.

It seems probable that the much-troubled DeTamble Motors Co., of Anderson, Ind., shortly will emerge from the embarrassment which led to the appointment of a receiver several months since. At any rate, it is stated that an offer has been made for the property which, if accepted, will lead to placing the company on a firmer foundation than ever before. It is not unlikely that the matter will come to a head before the close of the present month.

More Coils Coming from Fond du Lac.

Growing out of the Duplex Coil Co., of the same city, the R. C. Wells Mfg. Co. has been organized in Fond du Lac, Wis., for the purpose of manufacturing spark coils and other ignition appliances. It is capitalized at $200,000, R. C Wells, L. J. Fuhrman and F. J. Rueping figuring as the incorporators.

PROTECTIVE COMMITTEE DROPS DEEP, DARK HINTS

May Oppose U. S. Motors Reorganization Plan, But Committee Itself Is Mysterious—Hotel Waiter Who Sought "Protection."

Whatever the Protective Committee of the stockholders in the United States Motor Co. may be, it has plans outlined for procedure in the pending reorganization, but what those plans are is enveloped in considerable mystery. To date Frederick Drew Bond, of 15 Broad street, New York City, is the only known member of the committee, and he has advertised that he wishes to hear from stockholders with a view to concerted protective action. Apparently he is assembling the ends of strings which lead to stockholders throughout the country, and states that he expects to be able to announce something tangible within ten days; but he will give no inkling of their nature.

That all may not be peaceful on the way to reorganization is indicated by Bond, who states that the plans now under consideration are not at all likely to agree with the schemes of the reorganization committee; this latter body also has plans, but at the offices of Joline, Larkin & Rathbone, 54 Wall street, counsel for the reorganization committee, Henry V. Poor, a member of the firm, said yesterday (Wednesday) that it will be a week or ten days before things really will begin to move.

"Protector" Bond, however, evidently is having troubles of his own in getting in touch with the stockholders, for while he has heard by letter from quite a number in different parts of the country, there being some 1,100 in all, he has heard from but one in New York City where they are said to be quite numerous. The lone New Yorker who responded made a frantic dash into Bond's office when he saw one of Bond's advertisements; he was a French hotel waiter from the neighborhood of 40th street, and the mystery of why waiters are loath to see the tipping habit abolished may be somewhat cleared by the size of the Frenchman's holdings; he is the possessor of 99 shares of preferred and 250 shares of common stock. Of course this stock costs little on the market today, but it once sold for real money.

"Just what our plans are I do not feel at liberty to make public," said Bond to a Motor World man. "I am getting reports from stockholders regularly, and hope soon to be able to announce our plans. As to the relations between our proposal and that of the creditors' committee, I do not think they will agree. So many of the New York people who hold stock are out of town that it has helped delay matters."

Mack Finally Enters Lansden Company.

J. M. Mack, of Allentown, Pa., on Tuesday last was elected chairman of the executive board of the Lansden Co., of Newark, N. J. At the time of the reorganization of that company, about a year ago, it was reported that Mack, or some other officials of the International Motors Co., had acquired an interest, but the report could not be confirmed. Mack since has retired from the International corporation and now is devoting himself chiefly to the new Webb Co., which will manufacture motor fire apparatus in Allentown. His election as chairman of the Lansden executive board will relieve considerably R. S. Holtz, the president of the company, who resides in Chicago, and who, therefore, has not been well situated to devote himself closely to the duties of his office. Mack's entry into Lansden affairs also implies developments in the line of electric vehicles

Car Maker Sued on Curtain Patent.

Suit in equity has been filed in the United States District Court in Peoria, Ill., by the Jiffy Auto Curtain Co., of Chicago, against the Midland Motor Co., of Moline, Ill., for alleged infringement of the Jiffy patents. The infringement complained of consists of the use by the Midland company of a top which is claimed to violate the Jiffy patent.

San Francisco Garagemen Organize.

The garage owners of San Francisco finally have seen the benefits of co-operation, and to secure them have organized an association with the following officers: President, J. B. Kelly, Kelly Garage; vice-presidents, G. F. Chapman, Acme Garage, and J. C. Bowman, Pine Garage; secretary-treasurer, Arthur D'Ettel, Auto Service Co.

Flanders Meeting is Again Postponed.

For the second time, the special meeting of the stockholders of the Flanders Mfg. Co., of Pontiac, Mich., which was due to occur yesterday and at which an issue of mortgage bonds was to be considered, has been postponed, this time without date; necessary details have not been completed.

To Make Motor Plows in Oklahoma.

To manufacture a motor plow, the J. B. Wood Plow Co. has been organized in North Muskagee, Okla., and has been incorporated with authorized capital of $300,000. It is stated that the erection of a two-story stone factory, 191 x 101 feet, immediately will be undertaken.

WEBB-MACK FIRE ENGINE DEAL IS COMPLETED

New Company With $1,500,000 Capital Takes Hold and Plant in Allentown Being Equipped—Men Who Will Manage It.

Having completed the last detail, the Webb Co., of Allentown, Pa., which is the title of the new corporation which took over the Webb Motor Fire Apparatus Co., of St. Louis, Mo., is moving the equipment of the factory from St. Louis to Allentown and preparing for actual production in the latter city; in fact, a large part of the equipment already has been installed, and the new interests represented have assumed control.

Chief of the new men, as already is known, is John M. Mack, formerly of the Mack Bros. Motor Co., of Allentown, who became a vice-president of the International Motors Co. when the latter took over the Mack property. Having disposed of all of his International holdings and disassociated himself with that corporation, Mack has been elected treasurer of the new Webb Co., the president of which is A. C. Webb, the former head of the Webb Motor Fire Apparatus Co. George E. Blakeslee, of Jersey City, N. J., one of the veterans of the automobile industry, who was associated with Mack in the Mack Bros. and International enterprises, is vice-president, and W. J. W. Groves, a former Mack Bros. man, is secretary.

The active direction of the Webb Co., however, will be in the hands of Roland Carr, who has been appointed general manager. He is a new man in the automobile trade, but acquired a reputation in the course of many years as manager of one of Butler Bros.' eastern establishments. Harry Von, previously identified with the International corporation, will be superintendent of the Webb plant.

An office has been opened in New York City, but, contrary to reports, it will not be the general sales office. The sales department will be a part of the Allentown establishment and will be in charge of President Webb himself.

The Webb plant in Allentown comprises what was formerly the Allentown Foundry. It includes three buildings, one, 300 x 52 feet, having two wings, another, 325 x 100 feet, and a third, 60 x 75 feet.

While it is possible that ultimately other vehicles will be produced, for the present the Webb output will comprise two styles of pumping engines, a chemical engine and an aerial ladder truck. These will be

Digitized by Google

pushed with vigor, a cash investment of $560,000 making possible the development of all departments of the business.

The Webb Motor Fire Apparatus Co. was a $300,000 corporation. Its successor, the Webb Co., which is incorporated under Delaware laws, is capitalized at $1,500,000, of which $600,000 is represented by preferred shares.

Repairman-Insurance Adjuster Is Sued.

Even though Walter H. Stearns once did a good business on West 51st street, New York City, as a repairman and insurance adjuster, the left over ends of his business are not proving as pleasant as he might wish; for although the New York branch of the Couple Gear Co., of Grand Rapids, Mich., spent a year in getting service on Stearns, he finally has been made defendant in the New York City Court in an action for the recovery of $397.65. Stearns is asked to pay for parts and the time of an employe from the Couple Gear factory who came to New York to assist on a repair job done by Stearns. Stearns, as insurance adjuster, adjusted a damage claim for the Curtiss-Blaisdell Co., which owned a Couple Gear truck, and then, as repairman, undertook to repair the truck. It was in this latter capacity that the alleged indebtedness was incurred. Stearns in his answer sets up a general denial, but states that if any such thing did occur the Walter H. Stearns Co., an incorporation, is the debtor.

Two Dealers Garnishee Hearne's Deposits.

Although all the parties directly concerned are residents of Illinois, two suits have been instituted in the Circuit Court for Wayne county in Detroit, Mich., against the Hearne Motor Co., of Chicago, by the Reliance Motor Co. and W. C. Lumpkin, doing business in that city as the Mattoon Motor Car Co. The Reliance company seeks to recover $2,250, the amount of deposits made on cars ordered from the Hearne company and not delivered, while Lumpkin asks for $1,605.21 on a claim of the same kind. The suits were brought in Michigan so that the plaintiffs could garnishee the amounts due the defendant from the Hupp Motor Car Co., of Detroit. The latter has filed a disclosure in each case, showing an indebtedness by it to the defendant amounting in all to $1,428.76.

Remy Erecting Two More Buildings.

Ground has been broken by the Remy Electric Co. for two additions to its plant in Anderson, Ind. The new structures, which will be completed within three weeks, will provide 10,600 additional square feet of floor space.

KELLY'S WARM RETORT IN HUBER PATENT SUIT

Declares Invention "Worthless for Any Useful Purpose" and Denies Exclusive Ownership—Cites Long List of Prior Patents.

If the North American Vehicle Co., of Detroit, truly is seeking to test the Emil Huber three-point suspension patent, No. 788,407, which it has brought to bear on the trade, its desire is in a fair way of being gratified. The fact that two previous suits instituted against motor car manufacturers had been settled by the issuance of licenses to operate under the patent has not in any way influenced those who stand behind the Detroit Taxicab & Transfer Co., which also has been made defendant in a suit for infringement brought by the North American company. This action really is directed against the Kelly Motor Truck Co., of Springfield, O., whose vehicles are employed by the Taxicab & Transfer Co., and the answer which has been filed in the case makes plain the Kelly disposition to fight.

In addition to the usual formal and categorical forms, the defendant denies that it received notice of alleged infringement, or that it has disregarded such notice or refused to desist from alleged infringement. It also sets up that the Huber invention lacks inventive skill and is "wholly inoperative and worthless for any useful purpose." In support of its allegation that Huber was "not the original and first inventor or discoverer of the invention, or of any material or substantial part thereof," the Detroit Taxicab & Transfer Co. cites a long list of United States patents. The earliest, No. 183,970, was granted to L. Ransom, October 31, 1876, while the most recent, No. 810,379, was granted to H. M. Pope, January 16, 1906.

Among other things, the defendant denies that the North American Vehicle Co. is the sole and exclusive owner of the Huber patent, or of "any right and privileges intended to secure thereby," or that it has "invested or expended large sums of money or has been put to any great trouble or expense."

The Huber patent bears date April 25, 1905, and, as exclusively stated in the Motor World at the time the litigation was instituted, is claimed to cover "any driving mechanism of an automobile wherein the parts that go to make up the same are brought together in what is termed a unit power plant, suspended at three points upon the main frame, and wherein one of the points forming the triangle is arranged to swivel."

Million Dollars for Policeman's Tire!

A policeman's lot may not be a happy one, but if the tire which he has invented pans out as he anticipates, Arthur J. Elliott, a member of the Cleveland (O.) police department, may exchange the lot of a policeman for that of a millionaire. Elliott has interested the Standard Sales Co., of Cleveland, in his invention, which, according to local prints, has announced that it will build a "million dollar factory" to manufacture Elliott's tire. According to the same sources, "there is plenty of money back of the proposition." In the words of the general description which has been vouchsafed, "Elliott's tire is oval in shape and is so reinforced with steel that it is impossible to puncture it." Also it can be sold at 25 per cent. less than the automobile tires now on the market.

Goodyear Plant Still Being Enlarged.

Of additions to the Goodyear Tire & Rubber Co.'s plant in Akron, O., there appear no end. What is known as the No. 6 building, a six-story structure, 403 x 80 feet, is now in a fair way of completion, and meanwhile excavation has been made for a new five-story building, 250 x 50 feet, and for an extension, 325 x 40 feet, of building No. 14. It is expected that work on the three structures will be completed by the end of the year. In addition, there just has been completed a new and imposing building, 126 x 50 feet, and adjacent thereto a two-story garage, 143 x 56 feet, is in the last stages of completion.

Los Angeles Vulcanizers Get Together.

Tire vulcanizing establishments are not lacking in any part of the country, but on the Pacific Coast they are so unusually prolific as almost to astonish visitors from the eastern half of the country. In Los Angeles they are so numerous that the owners have formed an association with the following officers: President, James A. Alcorn, Alcorn Rubber Co.; vice-president, L. Shurley Freeze, Mosher Rubber Co.; treasurer, L. F. Phelps; secretary, Wiley Jackson, Jackson-Eno Rubber Co. The organization aims to conduct a credit bureau and to maintain a consistent tariff for vulcanizing work.

May Build Wagons in Asbury Park.

The Croce Automobile Co., of Asbury Park, N. J., has purchased a site, 100 x 125 feet, on Railroad avenue in that city, on which, it is stated, will be erected a two-story concrete factory building. Motor wagons and sight-seeing cars will constitute the principal productions.

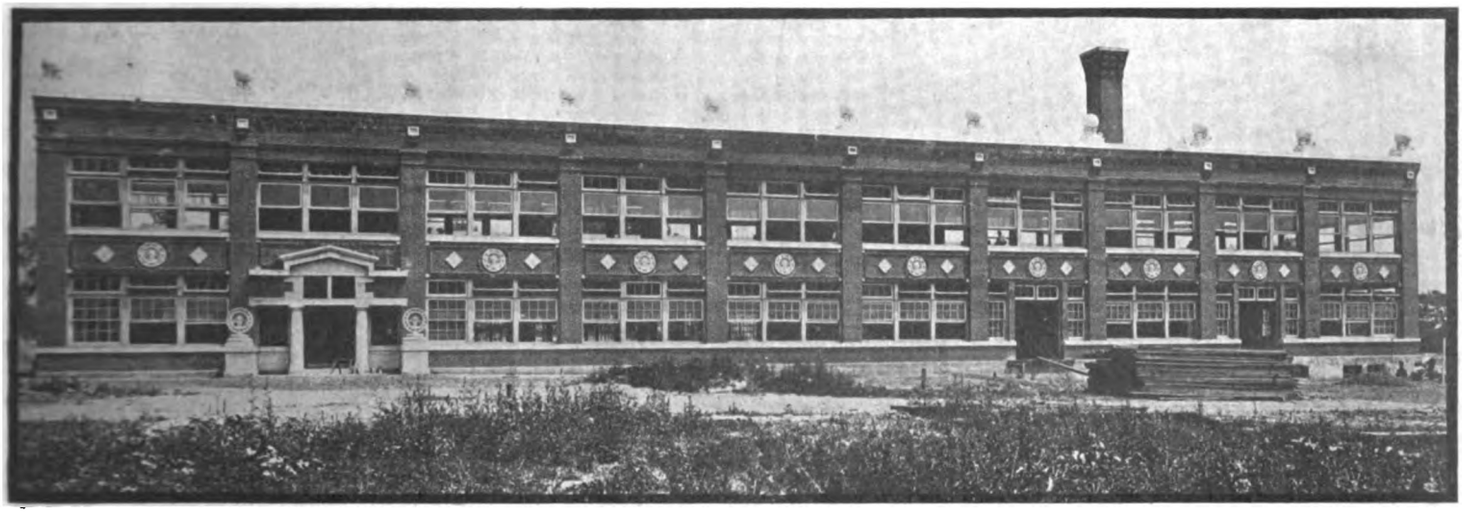
The Week's Incorporations

Dover, Del.—Imperial Garage Co., under Delaware laws, with $25,000 capital; to operate a garage.

Wichita, Kan.—Jones Auto Co., under Kansas laws, with $10,000 capital; to deal in motor cars. Corporators—J. J. Jones and others.

Portland, Me.—Fiber Products Co., under Maine laws, with $1,000,000 capital; to manufacture fiber products. Corporators—E. B. Cook, E. C. Fisher.

deal in motor cars. Corporators—S. L. Henderson, J. S. Allison, George S. Allison.



St. Louis, Mo.—Lewis Automobile Co., under Missouri laws, with $16,000 capital; to deal in motor cars. Corporators—J. D. Lewis, Walter H. McLean, John H. Jackson.

Wilmington, Del.—Lilge Gas Rotary Engine Co., under Delaware laws, with $1,000,000 capital; to manufacture motors. Carl J. Metzger, Roy A. Herrington, Ben F. Brady.

Newark, N. J.—John R. Price, Inc., under New Jersey laws, with $100,000 capital; to manufacture internal combustion motors. Corporators—John R. Price, G. W. Knorr, H. E. Price.

Indianapolis, Ind.—Corydon, New Albany, & Greenville Auto Bus Co., under Indiana laws, with $2,100 capital; to operate a motor bus line. Corporators—James

FIRST LINK IN THE RECONSTRUCTION OF THE HESS-BRIGHT PLANT IN PHILADELPHIA

The new building which forms the nucleus of a much larger plant which eventually will be erected, is at the corner of Front street and Erie avenue and measures 200 x 235 feet. At present the building is used only for repair work and for manufacturing the new Hess-Bright double row bearings.

Detroit, Mich.—Currier Auto Co., under Michigan laws, with $6,000 capital; to deal in motor cars. Corporators—M. S. Gorden, L. A. E. Gorden, L. G. Currier.

Freeport, Ill.—Overland Automobile Co., under Illinois laws, with $10,000 capital; to deal in motor cars. Corporators—W. J. Maurer, G. E. Maurer, F. W. Boettcher.

Houston, Tex.—Havoline Auto Supply Co., under Texas laws, with $10,000 capital; to deal in motor car supplies. Corporators—F. E. White, Edwin Hobby, J. W. Crotty.

Paterson, N. J.—Standard Garage Co., under New Jersey laws, with $25,000 capital, to operate a garage. Corporators—Martin While, Susan B. White, Oscar Harris.

San Angelo, Tex.—S. L. Henderson Co., under Texas laws, with $10,000 capital; to

Corporators—L. E. Lilge, G. P. Lilge, I. Fogg.

Chicago, Ill.—National Radiator Co., under Illinois laws, with $30,000 capital; to manufacture automobile radiators—Percy W. Sullivan, Theodore Schmidt, Edward A. Gramms.

Fond du Lac, Wis.—S. C. Wells Mfg. Co., under Wisconsin laws, with $200,000 capital; to manufacture ignition devices. Corporators—R. C. Wells, L. J. Fuhrman, F. J. Rueping.

Augusta, Me.—Mathiessen Spring Cushion Wheel Co., under Maine laws, with $60,000 capital; to manufacture spring wheels. Corporators—R. S. Bussell, L. J. Coleman.

Chicago, Ill.—Metzger-Herrington-Argo Co., under Illinois laws, with $50,000 capital; to operate a garage. Corporators—

M. Ferguson, Henry E. Rohling, and others.

Chicago, Ill.—South Park Automobile Garage Co., under Illinois laws, with $25,000 capital; to operate a garage. Corporators—Herman Frank, Harry Lurie, John A. Anderson.

Harrisburg, Pa.—Economy Tire & Rubber Co., under Pennsylvania laws, with $5,000 capital; to deal in motor car tires. Corporators—Edward L. Kroft, B. F. Knupp, E. M. Knupp.

Rochester, N. Y.—Lamax Mfg. Co., under New York laws, with $25,000 capital; to manufacture motors, etc. Corporators—Arthur B. Bradley, Philip E. Tucker, Arthur C. Lamay.

Camden, N. J.—Hub Twenty-second Street Garage Co., under New Jersey laws, with $100,000 capital; to operate a garage.

Digitized by Google

Corporators—F. R. Hansell, George H. B. Martin, L. C. Clow.

Chicago, Ill.—Automobile Accessories Co., under Illinois laws, with $25,000 capital; to deal in motor car accessories. Corporators—Alexander Meralli, Frederick L. Jackson, Frank D. Merolli.

Portland, Me.—National Chauffeurs' Association, under Maine laws, with $500,000 capital; to conduct a mutual benefit organization. Corporators—Albert F. Jones, T. L. Croteau, B. M. Marshall.

Portland, Me.—Reliance Speedometer Co., under Maine laws, with $100,000 capital; to manufacture speedometers. Corporators—Charles M. Drummond, G. M. Howes, Wadleigh B. Drummond.

New York, N. Y.—Mercedes-Daimler Selling Corporation, under New York laws, with $50,000 capital; to deal in motor cars. Corporators—A. M. Becker; John A. Lemline, E. H. Ferguson, all of 27 William street.

Chicago, Ill.—Automobile Inspection & Appraisement Bureau, under Illinois laws, with $2,500 capital; to inspect and appraise motor cars, etc. Corporators—James C. Johnson, Charles W. Barton, Thomas B. Convey.

Cleveland, Ohio.—Northern Ohio Automobile Racing Co., under Ohio laws, with $1,000 capital; to promote automobile racing. Corporators—Richard Lee, Florence Cawood, John Alburn, N. E. Weffler, Fred Hackley.

St. Louis, Mo.—Kaufmann Motor Tire Co., under Missouri laws, with $15,000 capital; to deal in motor car tires. Corporators—George H. Muehling, Norman Sadler and others.

New York, N. Y.—Motor Gear Improvement Co., under New York laws, with $1,250,000 capital; to manufacture motor car parts. Corporators—Henry C. Derham, 2d, S. V. Brady, Dwight Partridge, all of 250 West 54th street.

New York, N. Y.—Auto Despatch Bureau, Inc., under New York laws, with $25,000 capital; to operate a motor service. Corporators—Walter Stackhouse, 195 Lexington avenue; Harold Parker, L. S. Parker, both of 55 Liberty street.

Anderson, Ind.—Fraternal Order of Honk-Honks, under Indiana laws; to promote sociability among motor car dealers. Corporators—John Stockdale, Chicago, Ill.; Richard D. McCain, Harry F. Dunn, George McMahon, all of Anderson.

New York, N. Y.—Hunt & West, Inc., under New York laws, with $10,000 capital; to deal in motor cars. Corporators—Burton R. Law ,206 West 106th street; John W. Collopy, Jr., 10 Wall street; Elly Z. Parker, 470 West 146th street.

New York, N. Y.—Cameron-Rowe Auto Service, Inc., under New York laws, with $10,000 capital; to operate a motor car service station. Corporators—James Cameron, Norman Cameron, both of 203 West 107th street; August T. Rowe, 239 West 107th street.

New York, N. Y.—Miller, Hicks & Hewitt, Inc., under New York laws, with $10,000 capital; to deal in motor cars. Corporators—Harry D. Miller, 509 West 56th street; Henry T. Hicks, 441 West 124th street; George A. Hewitt, 370 East 183d street.

New York, N. Y.—New York Garage Association, Inc., under New York laws, with $2,000 capital; to conduct a general garage keepers' exchange. Corporators—Charles H. Potter, 154 West 124th street; Louis J. Joscelyn, 112 West 52dd street; William Burrows, 69 East 89th street.

Change of Corporate Name.

Jackson, Mich.—Clark-Carter Automobile Co. to Cutting Motor Car Co.

Washington, D. C. Auto Exchange Co. to Washington Motor Car Equipment Co.

Change of Name and Capital.

Dover, Del.—Everitt Motor Car Co. to Flanders Motor Co., and capital increased from $3,000,000 to $3,750,000.

Changes Among Prominent Tradesmen.

Fred G. Bremer has resigned as manager of the Twitchell Gauge Co., of Chicago. He has been succeeded by Max D. Bendel.

Lyle Miller has resigned as factory superintendent of the Midland Motor Co. at East Moline, Ill. His successor has not yet been named.

Hugh S. Quinn has been appointed manager of the Abbott Motor Co.'s retail branch in Detroit, his appointment being in the nature of promotion. He succeeds E. C. Thompson, resigned.

George N. Matheson has been appointed purchasing agent for the Hayes Mfg. Co., of Detroit. Previously, and for many years, he occupied a similar position with the National Motor Vehicle Co., of Indianapolis.

S. H. Humphries has been appointed factory manager of the Oakland Motor Car Co., of Pontiac, Mich. Until his appointment he was connected with the Elmore Mfg. Co., at Clyde, O., but for many years previous thereto he had been associated with the Peerless Motor Car Co. and the Brush Runabout Co., respectively.

Frank H. Trego, former chief engineer of the E. R. Thomas Motor Co., of Buffalo, has been appointed manager of the department of research engineering for the Packard Motor Car Co., of Detroit. Before he joined the Thomas staff, Trego was manager of the technical department of the Hudson Motor Car Co., in Detroit.

C. W. Eggers, who for the past two years has been traffic manager for the Willys-Overland Co., in Toledo, O., has been appointed general traffic manager for all of the Willys properties—the Willys-Overland Co. in Toledo, the Garford Co. in Elyria, the Gramm Motor Truck Co. in Lima, the Federal Motor Co. in Indianapolis and the Morrow Mfg. Co. in Elmira.

Cole Names Managers for Five Districts.

In order to better handle its business and keep in closer touch with its dealers, the Cole Motor Car Co., of Indianapolis, has divided the country into five districts, each of which will be in charge of a district sales manager, none of whom is an apprentice. William L. Colt, president of the Colt-Stratton Co., of New York, will be in charge of the territory east of a line drawn north from Washington, D. C., to Syracuse, N. Y.; E. C. Frady of the Cole Motor Co., of Chicago, will handle the North Central States; George H. Strout, former Apperson sales manager, will have jurisdictioin in the southeast and part of the Middle West; C. J. Corkbill, also a former Apperson man, will handle the territory bounded by the Mississippi on the east and the Rockies on the west; and J. R. Moler will have charge of all of the extensive territory lying west of the Rocky Mountains, and also the entire Dominion of Canada.

Stearns Locates Branch in Philadelphia.

The F. B. Stearns Co., of Cleveland, has taken over its agency in Philadelphia and hereafter will maintain it as a factory branch at 449-451 North Broad street. It will be in charge of C. Hilton Gantert, who for the past six years has been identified with the Stearns car in that city. The Stearns service bureau, which previously was maintained in Philadelphia, also has been made a part of the new branch.

Texan Forms a Tire Filling Company.

The Nopatch Tire Filling Co. has been organized in Fort Worth, Tex., to produce a tire filling compound originated by J. A. Reynolds, of that city, in which it is stated a plant has been established. The company has been incorporated with $110,000 capital stock and has opened a sales office in Dallas.

New Departure Factory to Expand.

The New Departure Mfg. Co. has let contracts for an addition to its plant in Bristol, Conn. It will be a three-story fireproof structure, 62 x 215 feet.

In the RETAIL WORLD

Joseph Wechtel is about to build a garage in Sibley, Ia.

Edward Warner is building a two-story garage in Ludlow, Vt.

Hugh Lucas, of Blue Earth, Minn., has sold his garage to J. J. Strack.

John Dyer, of Madera, Cal., is building a garage at Cosemite and F streets.

Pruitt & Jorgenson, of Granville, N. D., have purchased the Granville Garage.

Frank Richardson, of Gilman, Ia., has sold his repair business to Roy Poper.

Edward Bean has opened a garage in New Haven, Conn., on Columbus avenue.

A new garage has been built in Union Hill, N. J., by the Clifton Automobile Co.

C. M. Mather, of Clarksville, Ia., plans to erect a garage; he already has secured a site.

Garretson & Hoyt, of Fayette, Ia., are about to open a garage in Lancing, in the same state.

Fred Redezke, of Hebron, N. D., has bought the garage and repair business of E. H. Mann.

John C. Oliger, of Pittsburgh, Pa., is about to secure bids on a two-story and basement garage.

J. L. Tippins is about to establish a tire repair business in Savannah, Ga., at 408 Broughton street.

Coy Swift and Charles Larson are about to open an automobile and bicycle repair shop in Spencer, Ia.

Dell Hutchings, of Rockford, Ill., has "gone into" automobiles; he has signed up as Paige-Detroit dealer.

Simon Westra and Edward Van Woudenburg have purchased the Parkinson Garage in Rook Valley, Ia.

Hicks Auto Supply Co. is the style of a new business in Nashville, Tenn. It is located at 802 Broadway.

Plans have been prepared for a garage which Jacob Hagin will erect on Rahway avenue, Elizabeth, N. J.

A. G. McClary is having plans prepared for a garage which he will erect on Clinton street, in Defiance, O.

E. F. Tabor plans to construct a garage in San Francisco; it will be located on Valentine street near 26th.

Paul Luge and Joseph Poiser have established a repair business in McKeesport, Pa., at 719-23 White street.

Michael L. Joy is having plans prepared for a brick and concrete garage which he will erect in Putnam, Conn.

S. C. Fertig, of Titusville, Pa., has secured permission to build a garage at Central avenue and Martin street.

L. F. Case, of Elkhart, Ind., has purchased the interests of his partner, J. S. Landon, in the Landon Garage.

Eddy Bros., who have been in the trade in Marengo, Ia., are about to open a garage in Fort Dodge, in the same state.

Allen Baker, well known in motor truck circles in St. Louis, Mo., has taken the Dayton truck agency in that city.

E. B. Luder, formerly of Kyrle, Tex., is about to establish an automobile business in San Antonio, in the same state.

F. F. Anderson, of Coon Rapids, Ia., has bought the Henry Garage; he will improve the premises and continue the business.

Nels Narveson and W. A. Childress have started a repair shop in Mason City, Ia. The style is Mason City Vulcanizing Co.

John Lang, of Richmond, Minn., has purchased a building and will remodel it for a garage; he plans to open up in the spring.

The Akron Tire Co., of Philadelphia, Pa., has opened a branch in Washington, D. C., at 1024 14th street; N. A. Brandriff is manager.

The Ellis Motor Car Co., in Greenville, S. C., has been reorganized. Charles Ellis is president and A. G. Dale general manager.

C. W. Plain is organizing a stock company in Milton, N. D., to enter the selling field; he has the state agency for the Cartercar.

Harold E. Wolcott has entered the trade in Joliet, Ill. He has the Cadillac agency and will conduct his business at 100 Cass street.

The W. E. Allen Co., of Milwaukee, Wis., plans the erection of new showrooms on Grand avenue between 27th and 28th streets.

Ralph Smalley, of Woolstock, has purchased an interest in the Eagle Grove (Ia.) Auto Co. He will also handle the Overland line.

The Waggoner Garage in Litchfield, Ill., has been sold to Glenn Brubaker; Stanley Waggoner, the former owner, will go to California.

E. E. Cline has secured an interest in the firm of Franks & Merchant in Canby, Minn. A new garage and piano salesroom will be built.

Dr. F. L. Darrow, of Front street, Columbus, O., has commenced the construction of a two-story garage; it will be completed October 1.

Austin Bros., of Sioux Falls, S. D., have purchased E. E. Faubion's blacksmith shop in Ryder, N. D. Besides conducting it they will add a garage.

Llanerch Garage is the style under which a new business will soon be opened in Philadelphia, Pa., at Cooperstown road and West Chester pike.

A three or four-story brick and terra cotta garage is to be built on Highland avenue, Pittsburgh, Pa., for William D. Laird; it will cost $50,000.

John Pitka and E. E. Harlan have purchased the interests of Clinton Fosnacht and L. L. Hufford in the National Auto Specialty Co., of Tama, Ia.

S. E. Dilbone, of Hardin, O., is about to establish an accessory business in Sidney, O. He will occupy the building formerly used by the Robinson Garage.

The Standard Oil Co. is about to build a garage and offices in Chicago at 5810-12-14 Grove street; the building will be one-story in height and will cost $10,000.

J. J. Smith, of Crockett, Cal., is building a one-story garage building in Valona, in the same state; when completed it will be occupied by Antonoe Dowrellio.

E. R. Roehl, of Lewiston, Mont., has "gone into" automobiles and will have his salesrooms in the garage of the Lewiston Auto Co. He has the Ford agency.

Permission has been granted to Mary Siebeck, of Seattle, Wash., for the erection of a three-story concrete garage at 1100-06 East Pike street; it will cost $18,000

Bonnewitz Bros., of Toledo, O., are having plans prepared for a garage; it will be erected on the site of the Bonnewitz block

Digitized by Google

which was destroyed by fire a few years ago.

The Heimsch Automobile Co., of St. Louis, Mo., has purchased a site on Grand avenue and will erect a concrete garage and repair shop; the building will cost $30,000.

J. C. Sondles, of Greensburg, Pa., is about to sell his horse livery business and enter the garage trade; he will erect a concrete and steel structure for his new venture.

The garage heretofore operated in Saginaw, Mich, by the Olds Motor Works, of Lansing, Mich., has been taken over by T. W. Greve; he also has the Oldsmobile agency.

The Overland Sales Co., of Cleveland, O., has purchased a site on East 22d street, south of Prospect avenue, and will erect thereon a three-story sales and service building.

J. R. McIntyre, of Los Angeles, Cal., has let the contract for a garage which will be erected on Hollywood avenue; its cost will be $6,000.

George B. Fink is about to establish an agency in Syracuse, N. Y., at 215 James street; he will sell Kissel and White cars and trucks.

Charles Wedding, of Jerseyville, Ill., has purchased the interests of his partner, Clarence Heidscheid, in the firm of Wedding & Heidscheid; Wedding will continue alone.

Harry Welland, proprietor of the Marathon Motor Car Co., of Cincinnati, O., is about to build a one-story salesroom building; it will be located at Gilbert and Florence avenues.

George L. Gasier has purchased property in Niagara Falls, N. Y., opposite the Cataract Hotel, and will erect a garage; it will represent an expenditure of $50,000. The site cost $15,000.

Roy Clark, of Salina, Kan., has sold his garage to A. J. Cleveland and H. A. Brownley, of Minneapolis, Minn. They will remodel it at a cost of $1,500 and will continue the business.

Frank Freund, George Frank and Edwin Frank have purchased the Island City Garage at 2322 Post Office street, Galveston, Tex. The style has been changed to New Island City Garage.

Permission has been granted to W. D. Nellis, of Watertown, N. Y., to erect a two-story garage; it will be opposite his store on Jackson street, and will be ready for occupancy December 1.

The Hailey (Ida.) Auto Co. has been reorganized and henceforth will be operated under the style Fowler, Stimson & Furcht Auto Co. The new men in the company are Fowler and Stimson, of Grand Forks, N. D.

H. T. Moore and Ira T. Blakely have leased the Hickland Street Opera House in Princeton, Ill., and will remodel it into a garage; they also will be agents for several different makes of cars.

A. F. Shallberg is about to open an electric garage in Moline, Ill., at 1521 Library avenue; it will be the first exclusively electric garage in that city. Shallberg handles the Rauch & Lang line.

Maus Bros., automobile and piano dealers in Lima, O., has dissolved partnership; H. P. Maus, however, will continue the piano end of the business. A. D. Maus, the other partner, has removed to Arkansas.

The Robertson Tire & Auto Co. has opened up at 1920 Fourth avenue, Birmingham, Ala. W. W. Robertson is manager and associated with him are J. E. Vandergriff and E. R. Minhinnette. Cole cars are stocked.

C. A. Kellogg and J. M. Taggart have bought the repair business of Morrison & Dains in Mount Pleasant, Mich. The business will be moved from its present location on South Main street to 220 East Broadway.

Dr. D. F. Howard, as president, and R. S. Brownlee, as secretary and treasurer, are principals in a new stock company in Brockfield, Mo. They will operate a garage at West Boston and Livingston streets. The capitalization is $10,000.

J. Ceaser, of St. Louis, Mo, has purchased of William Miller, Charles Marquiss and Clarence Glazier a half interest in the Palace Garage in Webb City, Mo. The new member of the firm plans to add to the equipment and scope of the business.

Frank D. Pierce, of Helen, Wash., proprietor of the Silver Bow Auto Co., in Butte, Mont., is about to open another business in Spokane, Wash. He has the Stevens-Duryea agency and will locate in the Pacific Motor Car Co.'s garage at Fir and Maple streets.

The Maurer Garage Co., of Sheboygan, Wis., has been dissolved, and its business taken over by a new corporation, the Sheboygan Auto & Supply Co., of which the incorporators are C. F. Kade, Caroline F. Thieman and Felix Benfry; Carl Kade and Robert Thieman will manage the business.

What will be known as the Georgian Terrace Garage is being constructed adjoining the Georgian Terrace Hotel in Atlanta, Ga., for the accommodation of tourists; it will be three stories in height and will have offices, reading rooms, sleeping rooms and a hospital for employes and chauffeurs.

Peavey Rubber Co. is the style of a new concern which has opened up in Dallas, Tex., at 1505 Commerce street, as Texas and Louisiana agents for Kelly-Racine tires. The firm is composed of R. A. Peavey, a former Morgan & Wright representative, and N. P. Deavours and E. W. Ware, both of whom were connected with the United States Tire Co for ten years.

Overland Motor Car Co. is the style of a newly organized company in Davenport, Ia. As its name indicates, it will handle the Overland line. The officers are: President, Henry Bierkamp, of Durant, Ia.; vice-president, Henry Meyer, of Long Grove, Ia.; secretary and treasurer, M. Foy, of the Foy Supply Co., of Cedar Rapids, Ia.; general manager, G. H. Knowles.

The Landman-Griffith Motor Co. has been formed in Toledo, O., and will build a $25,000 sales and service building, 100 x 40 feet, at 14th street and Madison avenue; the structure will have its entire front of glass, affording ample display facilities, and will be completed December 1st. Charles P. Landman, who formerly was vice-president of the Blevins Automobile Co., is president, and W. E. Griffith, a former Blevins salesman, is secretary and treasurer. The capitalization is $10,000.

Fresno Dealers Form an Association.

The Fresno (Cal.) Automobile Dealers' Association has been formed with the following officers: President, Chas. W. Cobb; vice-president, George S. Waterman; secretary, Ernest Johnson; treasurer, C. W. Hobson. In addition to the president and vice-president, the executive committee embraces G. E. Gray, J. F. Gurley, H. B. Odell, W. Scott, Ernest Johnson.

Recent Losses by Fire.

Turon, Kan.—Union Motor Co., destroyed. Loss, $8,000.

New Rockford, N. D.—Motor Co., garage and four cars destroyed. Loss, not given.

Philadelphia, Pa.—J. F. Brinton, Highland Park, garage partly destroyed. Loss, $25,000.

Charlotte, N. C.—Mecklenburg Auto Co., Fifth and Graham streets, garage destroyed. Loss, $7,500.

Lewiston, Pa.—Robert Fleming, garage, machine shop and eleven cars destroyed. Loss, $15,000.

Locomobile Branch Opened in St. Louis.

The Locomobile Co. of America has established a branch in St. Louis at 3053 Locust street. It is in charge of A. L. Elwood, who formerly was identified with the Locomobile branch in Chicago.

HELP SOLVE THE USED CAR PROBLEM!

If you are interested in the well being of the industry, you are interested in the problem of the used car. It long has been the most serious difficulty that has confronted the dealer; and signs are not wanting that it will become even more serious. Anything that assists its solution, or lessens the evil, is in the nature of promoting the well being of the whole trade; for what affects the dealer affects the manufacturer in corresponding ratio. The problem can be solved only by a free interchange of ideas. To quicken the interchange, the Motor World has offered premiums of $50, $25, $15, $10 and $10, respectively, for the best articles relating to the subject. Why not add your suggestion?

ROOM FOR THE ELECTRIC HEATER.

There is a fertile field for the elimination of waste in the electrical equipment of the modern automobile. Ever since the dry battery was eliminated and the magneto put in its place the waste of electrical energy has continued. Almost any magneto generates considerably more current than is actually required to fire the mixture in the cylinders in regular order; what is not used goes to waste. Of course, with the ordinary high tension magneto it is practically impossible to stop the waste. But where low tension magnetos are used and where one of the combination electric lighting and starting systems, or even a lighting system is employed, there are many ways in which the excess current can be put to useful work, and not the least important of these well might be in furnishing heat by way of increasing the comforts of winter motoring.

Already several manufacturers have seen the light and are marketing electric heaters that are neither expensive to purchase nor to operate Without going deeply into the matter, an electric heater is simple and easy to manufacture, it occupies small space, consumes little current, is practically indestructible and never requires attention. Furthermore it may be applied anywhere that fancy or requirement dictates and the degree of heat it supplies may be adjusted with a nicety that is obtainable with no other temperature raising device. That the electric heater is practicable for automobile use is evidenced by its presence on several makes of electric pleasure car where it is built into place and forms part of the equipment. But whether it is supplied by the car manufacturer, built into place, or whether it comes under the head of accessories, that the electric heater holds forth inducements is not to be denied.

KEEPING ACCESSORIES "FOR ACCOMMODATION."

Can anything better serve to illustrate the attitude of the garageman toward the accessory market than the remark of the New York garage owner that he kept a stock of accessories "as a matter of accommodation for his patrons?" Can anything better illustrate the manner in which Opportunity thus is turned away from the garageman's door, even at the very moment that he complains of the meagreness of his income?

In nearly all other lines of trade, the chief object of merchants is to attract prospective purchasers within their doors; they spend large sums for the purpose. Yet the garageman, and the automobile dealer, too, daily and without cost are in direct contact with such buyers and still they suffer them to go elsewhere when accessories are required. When they keep them at all, they too often keep accessories only as a "matter of accommodation," which means that they are sold only when they are called for.

Mildly expressed, it is a regrettable state of affairs; it lacks all the elements of modern merchandising. If goods are worth keeping in stock, they are worth displaying, and if they are worth displaying they are worth selling, and the only way to sell them is to bring them to the attention of those who use such wares.

The automobile dealer and the garageman should look alive before it is too late. As the Motor World many times has remarked, department stores in the large cities, and hardwaremen in the smaller towns, are laying hands on that desirable class of trade which, by all the laws of logic, belongs to those who naturally have to do with automobiles and automobilists.

SIGNS THAT INCREASE SALE OF GASOLENE.

Even in prosecuting the sale of gasolene there is room for display of the merchandising spirit. The man who conspicuously posts the sign, "Filtered Gasolene, 20 Cents per Gallon," or "Doubly Filtered Gasolene, 20 Cents per Gallon," is certain to attract many more customers and sell many more gallons of gasolene than the man across the street who displays the familiar "Gasolene, 20 Cents."

The difference may appear a mere trifle, but it is attention to trifles of the sort that usually distinguish the successful merchant from the unsuccessful one.

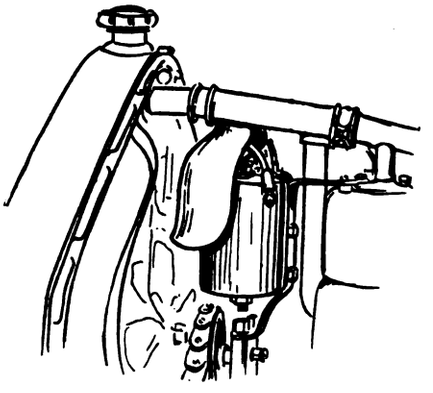
GREAT SHOW OF RUBBER BUT TIRES ARE SCARCE

Exhibition in Grand Central Palace Proves Interesting and Instructive—But Automobile Goods Are Not Conspicuous.



It is doubtful if there is a substance that is more peculiar or more mysterious in its origin and properties than rubber. To the layman it probably would be difficult to identify the crude material from the finished rubber products that are in every day use, for though there are abundant opportunities for becoming familiar with rubber in its commercial form, it seldom is exhibited in its raw state. At any rate there seldom is exhibited so great a quantity of raw rubber as there is on view at present in Grand Central Palace in New York City. It forms at least two-thirds of all there is to be seen at the Third International Rubber and Allied Trades exhibition, which was opened on Monday, 23d inst., and its value, according to various estimates, is upward of $400,000. The exhibition will be open until Thursday night next, October 3d, and in the meantime those who are interested in rubber can go to Grand Central Palace and see it and feel it and smell of it and taste it if they like.

There is rubber of every description and kind in every shape and form, from the crude latex as it comes from the Hevea trees to the finished rubber articles of commerce. But by far the greatest part of the exhibition is made up of raw rubber. It is shown just as it is collected by natives in the wilds (and cultivated places) of its origin; it is shown in bales and bundles and sheets; and some of the exhibition booths are ceiled and railed and floored with it. Brazil and Ceylon and a few other highly interesting and equally hot countries have whole sections devoted to the exposition of crude rubber, and at some of the exhibits it requires not much stretching of the imagination to see the natives actually at work collecting the precious juice, so realistic are the tropical forest scenes that are reproduced.

Despite the intimate connection between the rubber industry and the automobile industry, however, there is a noticeable absence of rubber products, such as are used in automobile construction, tires even being conspicuous by their poor representation. All in all, there are just exactly two exhibitors of automobile tires, the Home Rubber Co., of Trenton, N. J., which has on view about a dozen Home casings and tubes, and the Swinehart Tire & Rubber Co., of Akron, O., which exhibits a score or more commercial vehicle solid rubber tires and a representative line of pneumatics. Of course, the United States Rubber Co. is represented. It has the largest single space of any exhibitor, though, strange to say, there is not even a scrap of rubber in the big enclosure. Instead, the mahogany rails which fence the space serve also as receptacles for a number of carefully executed and mounted photographs and prints of the various tire and rubber goods factories subsidiary to the parent company.

Little Known Features of Well Known Cars

Removing accessories and other "impediments" from the dash opened the way for

CADILLAC COIL POSITION

the display of no small ingenuity on the part of motor car designers, none of which is more ingenious than the manner in which those who have to do with the designing of the Cadillac car have disposed of the ignition coils. Naturally the closer the coil or coils, as the case may be, are located to the cylinders, the shorter need the high tension cables be and the simpler become the problems of providing efficient insulation. Yet too close proximity with the heated cylinders, unless the coils be of special construction which admits of their working at temperatures considerably above normal, involves the destruction of the wax and resin insulation.

On the Cadillac car, which employs the well-known Delco ignition and starting system, which involves the use of current taken at low voltage from the generator and "stepped up" by means of a pair of transformer coils to a point where it is available for use in connection with the ordinary jump spark plug for ignition, the coil location is unique, in that although the coils are positioned adjacent the first cylinder, they never can be heated to a degree where the insulation is liable to suffer. As shown in the accompanying illustration, the coils are located on a bracket just ahead of the first cylinder and directly behind the fan, where the comparatively cool air which continually is drawn through the radiator precludes any chance of their overheating, and, in fact, maintains them at all times, while the motor is in operation, at a uniform temperature. By way of protecting the coils as well as the cables which are attached to them from mechanical injury through contact with tools, etc., a cast iron hood, held in place by the copper tubing through which the high tension wires are run, completely encloses the top of the coils.

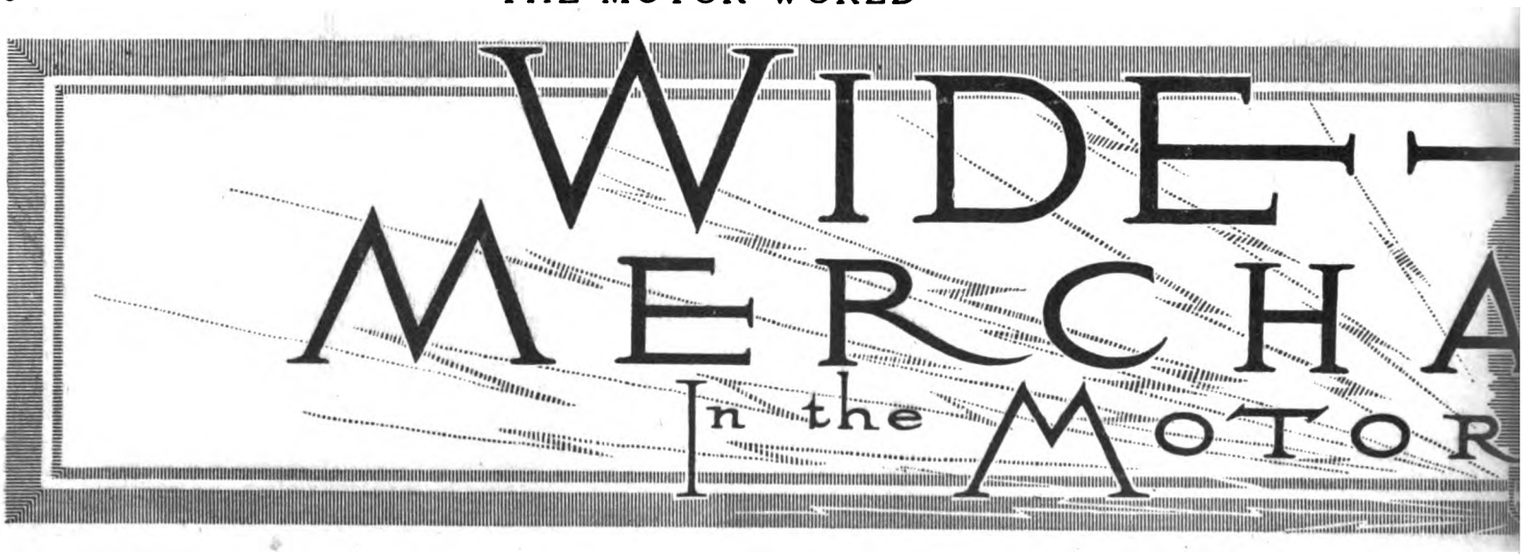
MODEL SALESROOM AND GARAGE TO INSTRUCT DEALERS

Building in Detroit to Be Equipped by Studebaker Corporation as an Example for Its Dealers—Ideal Window Display, Floor Arrangement, Repair Economy, Labor Saving Devices and Service to Be Exploited, While Branch Actively Conducts Business.

STUDEBAKER "OBJECT LESSON GARAGE" WHICH WILL HOUSE MODEL SALESROOM AND REPAIR SHOP

Instruction in selling has been a part of the more successful of those among the present day manufacturers of automobiles, and that the salesmen and dealers might know the car to best advantage and be given what knowledge of salesmanship the factory organization possessed, schools and similar schemes have grown up in connection with many shops where cars are built. Today, however, manufacturers are ready to concede that the increasing of efficiency in the dealers is a problem which merits attention and which is being studiously followed up by the progressive members of the trade.

Numerous plans have been adopted, but the majority get but little further than the sending out of dealers' literature which is designed to rouse enthusiasm in the medium between the factory and the public, and which is intended to keep the man in the field posted on latest development at the factory and most recent additions to the concern's selling points. Reading matter often is thrown aside unread and often a very properly raised question is that of the efficiency of this method.



Marking an innovation in instruction, the Studebaker Corporation, of Detroit, Mich., has literally killed two birds with one stone, and while furnishing an establishment which will constitute its Detroit branch, it has arranged to present the branch as a model salesroom, garage and repair shop, that those who see it and who are inclined to improve their ways may "go and do likewise."

The building, which is located at Woodward and Charlotte avenues, was originally fitted up for the United States Motor Co. and was used by it as a Detroit branch; but the structure has been secured by the Studebaker Corporation, and extensive remodeling has been done, the building, however, admirably lending itself to this plan. Sales Manager Benson is father of the scheme.

The dealer who visits the Studebaker factory and who is escorted to the Detroit branch will see as he approaches a white tiled front which will glisten and gleam with spotless cleanliness. Inside the various divisions are laid out to best advantage, and every available form of labor saving device will be found. The window display is an object lesson in itself; special attention has been paid to floor arrangement; economy in repairing forms almost a special course of instruction, and—more important than all—there are forcible hints as to the proper definition of that much-abused term—service. While the great majority of dealers probably already have their garages constructed, the model is intended to furnish ideas for economy of operations and for improvement and to suggest plans in case new buildings are contemplated.

A. K. McLuney, formerly manager of branches for the General Motors Co., will be in charge of the branch and will also act in the capacity of instructor to the Studebaker dealers who visit the branch for a lesson in the best way to conduct their line of business.

SYSTEMATIC WORK VITAL FEATURE OF GOOD SALESMANSHIP.

Know Why You Win, Know Why You Fail.

Good salesmanship means first of all work. And then more work and still more work. But it means organized work—planned work, carefully followed up work, continuous work that finally crystallizes into orders and profits.

The reason why more automobile dealers and salesmen don't succeed in larger measure is that they are not working to their limit. They are not planning intelligently and systematically for the use of every moment of their time in the accomplishment of their great purpose to sell automobiles and make money. Getting back to first principles, what is it that makes the wheels go round for dealer and manufacturer? Sales—Sales—Sales. That's what makes one concern more prosperous than another. With overhead established, rent the same, just as many cars to store, the same opportunities to sell gasolene, oil and sundries, good management established, few leaks between the stockroom and the cash drawer, the vital point that makes the difference between success and failure is **sales.**

Solve the Conundrum.

If you are dissatisfied with your business—don't seem to make as much money as you should—see others with apparently no greater opportunities than you, doing better, don't look for excuses, but forget the business for a day or two and **take the opportunity to thoroughly study yourself and your methods.**

See if in yourself you cannot find the leak. What is lacking? Is it initiative? Is it energy? Is it enthusiasm? **Is it stick-to-itiveness?** Or, is it the lack of a systematic plan, the absence of a carefully laid out campaign of action?

Plan Sales Work—Work the Plan.

Napoleon's battles were won on paper before they were fought. The battles of selling are won the same way. In many cases where an automobile dealer is not doing as well as he feels he ought, the condition can be traced to unsystematic work. Some people dislike the word "system." To them it means blanks to fill out, "red tape," they call it. But it does not mean anything of the kind. It means **plans;** plans laid out after careful study of the car and the territory, and the prospects. It means carrying out those plans. It means hewing to the line. It means no longer working haphazard, but making every moment of your time count.

Keeping Up Strain.

The distinguishing feature of big executives is usually nothing more or less than the ability to **plan** and execute those plans through others.

The more you can do and get out of your own time and that of your employes, the more money you are bound to make. This doesn't mean slave-driving; it means planning for the elimination of waste.

Plan Each Day's Work.

Each man is an organization in himself. His time is his most valuable asset. As Arnold Bennett says, "No man has any more or any less than you have," and "No matter how much of that precious commodity you may have wasted in the past, tomorrow will bring your full share, just as much as any other man living can have." Time is the capital of the salesman. This is why the salesman can afford to forget money and forget other things and concern himself with the planning of his time, as if it were, what it is, his most precious commodity.

Motor World is determined to spare no pains in making itself a really and truly DEALERS' paper. Put up to us your problems. We are bound to be A Friend at the Elbow

It Pays to Hustle.

We keep track of money, we watch its income and its outgo—why not keep track of time? Why not see how much we can save, how little we can waste, by planning? If every automobile dealer and every automobile salesman could see the importance of using every bit of time to best advantage—and working, there would be fewer complaints of poor business.

Make List of Prospects.

What shall the dealer who wishes to invest his time wisely do first? There is only one answer. The object is **sales.** The first thing to do is to make a list of prospects. Not a list of car users, but a list of the people who have sufficient money to buy a car. How shall he find out who they are? Start with the telephone directory—a list of the merchants and manufacturers—the local blue book—a list of farmers, who have money, gained throuyh friendly acquaintance at the bank or some store where you have purchased goods—inquire among neighbors—all these and many others, including inquiries among automobile owners, are open to him. These are the ways of a stranger in the community. Usually a live

Digitized by Google

AWAKE NDISING WORLD

of every one of our dealer readers. Manufacturers also are requested to send us any suggestions that will help us conduct this department along these lines.

dealer knows who among his townfolk can afford to buy. If not, he can find out with littel difficulty.

Get a Grip on Yourself.

After the list is made up, what then? One firm makes out a card with name and address of prospect and date card is made out—this is filled in in triplicate. One card goes to the salesman, one to the desk of the owner of the garage, one to the office file. This firm has three salesmen. The prospects are divided among them according to the dealer's judgment. Now enters "system"—a definite plan into operation.

Testing Your Capacity.

Every salesman makes a calling list every day and reports on the calls next morning to the office girl, who enters reports on file cards and on the dealer's personal card. The dealer, who thus becomes a sales manager, finds the cards containing yesterday's reports on his desk first thing in the morning. He makes whatever further plans are necessary and the cards go into his file. The important and vital part of this plan is the daily report and the fact that **every salesman must report on his prospects complete within thirty days.** That is, he has thirty days in which to make a sale. If he does

CARTERCAR SALESROOM IN DETROIT IN WHICH MODERN MANAGEMENT PREVAILS

Digitized by Google

not make the sale within that time or show some evidence of negotiations that are about to mature within a few days, the prospect is assigned to another salesman.

Establish "Quota" Plan.

This same concern, which, by the way, has been very successful, has established a sales minimum below which no man can fall and keep his job. It may be four cars or five, depending upon the model sold. This plan is known as the "quota" plan and is employed by notably successful specialty concerns such as the Burroughs Adding Machine Co. and National Cash Register Co. It works. It is the right plan for the automobile salesman, because he is a "specialty" salesman.

Stop Fiddling.

To fix the right quota is a delicate job. It requires intelligent study of the field. but it can be done. Even if the dealer is his own salesman, he can employ it. Let him fix the number of cars he should sell in the year. Then divide that up into months, weeks and days. Then live up to it. It means work. But it is exciting, energizing work. It fills one with enthusiasm. It braces one up. It makes one plan and helps him to cut out the waste. It means more sales and more money. It will keep a man so busy working—not "fiddling around" the store or garage—but meeting and selling prospects that he will wonder why he never thought of such a money-making plan before.

TRAIN EMPLOYES TO GIVE CUSTOMERS INSTANT ATTENTION.

A well known Detroit automobilist drove his car up the long concrete pavement leading to a North-end garage in Detroit. He wanted gasolene. There was a man fixing a tire two feet away from the gasolene pump; he looked up, said nothing and went on with his work. Then a man emerged from the back of the garage, where supplies were kept, and walked rapidly toward the front office. Then a man doing some polishing over in a dark corner peered at the motorist suspiciously but continued polishing. The man who had been making tracks for the office returned to his lair in the back, walking rapidly past the newcomers as if they had smallpox or some other virulent disease.

Do You Drive Trade Away.

So far, it appeared to the motorist that no one was over eager to do business. Then he woke the echoes with his Klaxon. Presently the polisher came forward, cloth in hand, and inquired if he wanted anything. "No. I just drove in to watch the vaudeville," said the heated automobilist as he backed out. Seven minutes he had been waiting, each minute getting more impatient. Now he boiled over and was gone elsewhere. Could such an incident have happened in your garage? Do you know any better way to drive away customers?

Every Man Is a Salesman—Tell Him So.

Every man on the garage floor is in a real sense a salesman. This should be impressed on him. His methods reflect the proprietor. Any one of these men could have said cheerily, "Just a minute and someone will wait on you." Not one of them said anything. If the proprietor had been there the chances are he would have rushed over to see what was wanted, glad to welcome a gasolene customer who later might become a car customer. His neglect lay in the fact that he had not communicated his spirit to his men.

In no business do the employes come in closer contact with the trade. In no business is it worth more to have customers looked after promptly, courteously and attentively. A little confidential talk along this line to each individual man will work wonders. Try it.

Provide Proper Toilet Facilities.

It is not as difficult as it might seem to trace a very definite connection between good merchandising and better toilet facilities for garage patrons.

This statement is prompted by the fact that in a tour of several thousand miles in many states, during which several hundred garages were visited, it is impossible to recall more than one or two places where the dealer or proprietor had provided suitable or adequate toilet facilities for customers.

The Insult of It.

Two styles of "facilities" occur to mind—one is the usual dirty, dark corner with a cigar box nailed above supplied with soft soap—the other style is the hose tap. In no case were clean towels supplied; in most cases no towels were supplied, not even a roller towel.

Things in a good many garages would be very much different if the proprietors could, in imagination, step outside and for a few minutes become customers.

Do It Now.

No dealer can afford to be so backward as to overlook providing conveniences for his customers. The clean wash room with decent soap and clean towels is something that is bound to come eventually in every garage. Soon dirty and neglected washrooms will be a thing of the past. Why wait? Why not be a leader and provide the proper toilet facilities now when their introduction as part of your regular equipment would be a distinct gain and add to your reputation for up-to-date methods.

IT PAYS TO PUSH ACCESSORIES. PLEASES CUSTOMERS, TOO.

The first thing that meets the eye of the motorist who drives into a popular Eastern garage is a big sign reading, "We carry a full line of Tires and Accessories."

"You have no idea what a hit that makes," said the owner. "Not the sign, but the fact that we do carry a complete line of everything the motorist possibly can need. Besides a full line of repair parts, we carry trunks, trunk racks, tires, lamps, horns, speedometers, spark plugs, oils put up in cans of all sizes, graphite, grease, dope, guns, patches and so on down the list. We buy this stuff right and sell at list prices, and if we haven't the article in stock we send and get it.

"Besides showing a liberal profit on the investment, our tire and accessory department has helped to make our garage automobile headquarters for miles around."

Too many dealers confine their efforts to gasolene and oil, when they could be making money and friends by putting in a complete accessory line.

Things That Affect Lamp Filaments.

In nine cases out of ten undue breakage of tungsten filament lamps which are used in connection with motor car lighting systems is attribluted to excessive vibration to which the bulbs are subjected, but there are other causes of such breakage. For instance, if the automatic regulator fails to function properly when the motor is turning over at a high rate of speed, the voltage will rise to a degree where the lamps in all probability will be "flashed" or burned out. In such a case all of the lamps which were lighted at the time will be rendered useless. Where two or more lamps are connected in series, as obtains in not a few of the systems in use, a short circuit which cuts out one of the receptacles will cause the other lamp to be burned out. The remedy, or, more correctly speaking, the preventive is found in the provision of fuses of suitable capacity adequately to protect the lamps. Naturally where fuses are installed the generator also is protected, for the fuses prevent overload.

For temporary use on finished surfaces it is a good plan to cover the face of an ordinary hammer with a piece of leather secured with wire.

STOPPING THE SALES TALK AT THE "SELLING POINT"

Talking Too Much May Cause the Prospective Customer to Change His Mind Whereas a Pause at Right Moment Assists Sale—Studying People as an Essential Part of the Salesman's Education—Dealer Reilly Exemplifies on a Saturday Half-Holiday.

Once in a while in the boy's sized city where Reilly annually placed in service his allotment of cars—and then a few more—the business men agreed that upon certain Saturdays they would lock the doors at noon and convince themselves that they were taking a day off; on such occasions "automobile row" generally followed suit and most of the demonstrating cars in the city could be found upon the long and shady stretch of state road which formed the overland connecting link between the town and the next city, which happened to be the one where was located the factory in which Reilly's line of cars were made.

Anticipations of a Pleasant Spin.

On a certain Saturday the factory Sales Manager had dropped off to see Reilly on his homeward way from a "boosting" trip through the State, and, arriving at near noon, the two planned to run up to the factory that afternoon, for this was one of the Saturday half-holidays, and as the sales manager walked down the street where there was more or less of an odor of gasolene in the air, "automobile row" was making most of the remaining half hour before it closed the doors. The sales manager, although riding in a car was nothing new to him, looked forward with pleasure to the homeward run, for besides being a pleasant journey over a superb road, it was far better than being cooped up in a chair in a railway coach.

"What time do we start?" he asked as he swung in through the door of Reilly's salesrooms and dropped his traveling bag inside the office door.

An Eleventh Hour Visitor.

"Not until after 12 o'clock," was the answer. "We don't close up until noon. We could, of course, if we wanted to, but I never like to shut up during office hours. Besides," he added with a dry smile, "I might make a sale."

"O, very well," responded the sales manager, who forthwith hied himself to the inner office, threw his feet upon the desk and lighted a cigar. Reilly meanwhile was busy with various details.

It was five minutes to noon by the clock when the salesman arose and strolled out upon the salesroom floor. Time was passing slowly for him, and he intended giving Reilly one more prod to see if he could not get a "rise" out of the usually agreeable dealer. But the salesman never gave the prod. As he reached the center of the floor there came breathlessly in the door a man who bore exterior evidences of caste in the business world and in whom such haste appeared unseemly. He seemed relieved when he found himself inside the doors and, slowing up a bit, he approached the sales manager and said, "Are you Mr. Reilly?"

"This is Mr. Reilly," replied the one addressed, as he indicated the dealer.

Sold With Surprising Celerity.

"Didn't think I'd make it before twelve," panted the newcomer. "Glad I beat the clock. I want to buy a car. What's this one here—is it for sale?"

"Yes, sir; it's the only one on the floor I can let go. That and my demonstrator are all I have on hand just now."

"What's the horsepower and capacity and how much is it?"

"Thirty-five horsepower, five passenger, fifteen hundred dollars."

"Good; I'll take it. Accept a check?"

"Certainly," replied Reilly, who recognized his customer as a well-to-do merchant; "do you want the car now?"

"I certainly do," was the answer; "I want to use it this afternoon. I've been going to get a car for some time, and this fine half-holiday—and my wife—sort of hurried me up."

While the customer wrote the check Reilly ordered the gasolene tank filled and the car made ready. "Can you drive?" he asked.

"Yes, I learned that this summer, expecting to get a car later in the fall."

Where Argument is Superfluous.

The clock pointed to 12:05 as the car glided out the door and the sales manager was speechless. "Some sale, isn't it?" he ejaculated.

"Oh, no," said Reilly, in his quiet way. "That's the way we sell all our cars."

"Ah," was the salesman's guttural exclamation of disbelief.

The dealer's only answer was to tuck the check in his billbook.

"Honestly," said the sales manager, "I never saw a sale made that way. Why you never even told the man anything about the car. He blew in here like a cyclone and you never gave him a chance to be convinced. You never told him anything about the car. Do you let everyone come in like that and not try any sales talk on them?"

"Sold the car, didn't I?"

"Yes, but——"

"Got the money, haven't I?"

"Sure, but——"

"Well? But what? What's the use of telling the man a lot of stuff when there is no need of it? If he gets to the point where he wants to buy, sell him a car. Don't waste a week chewing at him and give him a chance to change his mind. One of my owners has been influencing this man, so I didn't need to talk. I expected he'd buy some time."

Knows When to Stop Talking.

"That gets me, though," said the still amazed sales manager.

"Well, if it gets you right it'll do you good," retorted Reilly. "That's what ails ninety per cent. of the salesmen you meet. I'll guarantee about all you have on your staff are the same way. They know how to begin but they haven't got brains enough to quit. What's the use of talking longer than is necessary?

"I've had all kinds of salesmen and I never had but one who was a real honest-to-God salesman. I've got him yet—and I don't intend to lose him if I can help it. I spent some time drilling a few things into his head, but he was a bright sort of a fellow and he certainly soaked up his lessons. Now he's even better than I am. He has learned when to stop talking. You take the average salesman and he starts with an idea that he must learn the car he is going to sell and learn it so that he can rattle off a story about it down to the last bolt and nut. He thinks all he has to do is to stand up beside the car and speak his piece and by and by the prospect will take him by the throat and insist that the salesman trot out a contract for the prospect to sign.

Wherein Salesmen Differ from Parrots.

"The first part of it is all right— and the last part is all wrong. The salesman needs

Digitized by Google

to know the car, and he needs to know how to be able to talk about it convincingly, but he ought not to overdo it. Every prospect will stand a certain amount of talk and then he either is going to buy or he isn't going to buy. If he thinks he isn't going to buy, a little more persuasion won't do him any hurt, but if he is going to buy, a little more persuasion is quite likely to kill the sale.

"How can a man know when to stop? Right there, Jimmy, you have hit it on the head. There is no rule; it's something a man can't be taught unless he is the right kind of a man. You can give a man all the instruction you want, but if he hasn't the faculty of reading people he might as well give up hope of ever becoming a real salesman. He doesn't necessarily need to be a mind reader, but ought to be able to follow a prospect's thoughts after a fashion. The best men in the business have learned this themselves without any instruction whatever on that point.

The Salesman Who "Fell Down."

"I saw a salesman one day trying to make a truck sale in another agency further down the row. He knew his truck from A to Z and could not be stuck on anything mechanical pertaining to commercial vehicles. He also had made a study of the prospect's problems and had very convincing arguments as to why this particular truck would fill the bill in the prospect's service. The merchant was open to conviction, and listened with interest to what the salesman had to say. That the man really seriously considered buying a truck or at least was giving attention to the proposition was evident from the questions he asked about the wagon and what it would do. He wasn't very familiar with commercial cars but knew of instances where they had more than made good, and was the type of man who would invest two or three thousand dollars if he saw a chance of making a saving somewhere that would be commensurate with the expenditure. He was almost willing to risk the price of the truck just to satisfy himself as to its saving ability in his business.

"Well, the salesman talked and talked and talked. He had answered all the prospect's questions satisfactorily and had shown up the truck finely. He really had done a good bit of sales work in the way he talked up his truck. But—he didn't make the sale. The prospect reached the point where the argument should have been closed up, and the prospect been given an opportunity to sign a contract, but the salesman missed out at the crucial point. He was overanxious and kept right on handing out dope talk what a good thing the truck was and got to a point where he was repeating a lot of things he had said before. Repetition is all right in the right place, but this fellow repeated his repetition and the prospect got to thinking it over, changed his mind, and decided not to buy.

What the Prospective Buyer Thinks.

"What happened to him was what you have had happen to yourself many times when the same kind of salesman tried to sell you something. He was convinced and ready to buy at a certain point, but with a little more time he got to reflecting and the more he reflected the more he began to believe that it would be just as well if he waited a few days and investigated a little further. He finally said he was very favorably impressed with the truck, but would rather wait a few days and talk the matter over with some of the men at his place of business. The salesman tried his best then to clinch the sale. He knew he had been close to it and ought to have gotten it, and he couldn't for the life of him see why the merchant didn't sign up.

"Did he sell it a few days later? No, he didn't; they very seldom do. What he did was to pave the way for a truck sale for another dealer. The salesman's arguments and study of the merchant's delivery and trucking problems had shown the prospect where a truck would save him money, but having once been almost persuaded and not having bought he had a peculiar feeling toward this particular make of truck. Other dealers were after him, and one of them, who knew how to do it, landed him in less than half the time the first salesman spent on him. The second salesman saw that the merchant realized that he needed a truck, and when the advantages of the second one were shown up and the sale clinched at the right time, that ended it. Also, the man on the scene always has the advantage even though the prospect be partly favorable to another type of vehicle. Once let him get away from you and he generally is gone for good.

Selling at the Right Time.

"Sometimes it takes days or weeks to get a man up to the buying point. As a general rule the first session does not end in a sale; but when the prospect has been well worked along and you get him up against the car itself and feel that the time is ripe and the prospect ripe, too, then is the time to pick the fruit. It's nothing more nor less than picking fruit; there is one time when it is just ripe and ready to fall into your hands, but if you let it hang it gets rotten and never falls, or else it falls into some other man's hands. It isn't always a popular line that sells; some salesman can sell anything."

"But, Reilly, do you believe in selling a car or a truck to a man when you know he doesn't want it and doesn't need it and would be disappointed with it?"

"No, of course not. Some dealers will do that, but the man who is building for the future will spoil his structure if he uses such stones in his foundation. Success to a large extent is founded on satisfied owners, and while service and other things help bring about this satisfaction, it is hard through service or anything else to keep a man satisfied when he knows and you know that he has been loaded up with something he doesn't want and has little use for. Some men are easy marks for salesmen, but if the easy mark has no use for my goods I am not going to sell to him. It might be different if it was something that didn't cost but a few dollars, but when it is a car it is too much money for the ordinary man to throw away."

"But outside of all this, what time do we start for the factory? I was in a hurry when I came in here, and here you have kept me monkeying around until now it's half past twelve."

"Start?" said Reilly. "Start now if you're ready! I've been waiting for you since that man went out with that car!"

Loading Up the Easy Mark.

"Well, let's start," said the sales manager as he climbed into the car and waited for Reilly to do likewise. "Say!" he added, "you certainly are some spellbinder; here I've forgotten all about eating dinner. Where does that come in?"

"Oh, we'll stop at a little Dutch roadhouse just outside of town. And if you want to see an example of how a salesman will try to load up a man with his goods, just wait and see what that Dutchman will try to sell you for dinner."

"Well, hurry it along," urged the sales manager, "for if the Dutchman's got any kind of a line of goods I'm afraid I'm going to be an easy mark."

Cranking An Engine Against Compression.

A motor that is very hard to turn over against compression sometimes is started by swinging the crank to and fro several times in order to gain the momentum necessary to carry over the compression. When it is necessary to do this the greatest care should be taken to see that the spark is retarded. If the spark is the least degree advanced a back kick is more than probable if the center is approached slowly, though in the case of a motor that could be turned over rapidly, a very slight advance would do no harm, nine times out of ten. Even in a small motor, however, the only real safety lies in having the spark really retarded.

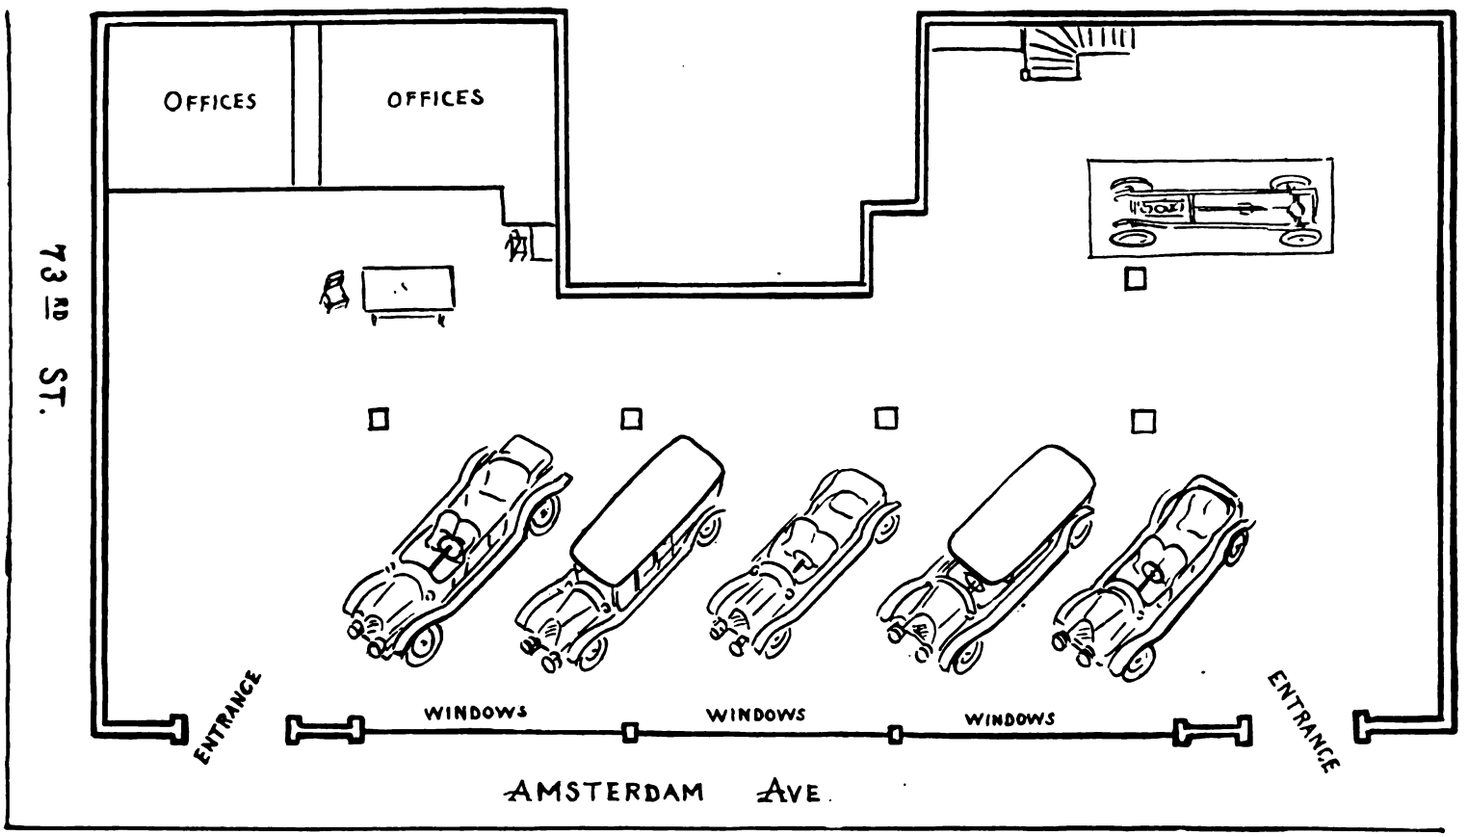
DEALER WHO STUDIED THE FLOOR OF HIS SALESROOM

Arrangement of Cars That Was Evolved as the Result of Careful Thought Proves Drawing Card for Metropolitan Motor Car Representative Space Is Economized at Same Time That Attractiveness Is Increased—Effects That Were Obtained.



It is the little things, so men ever have been told, that go to make up the great aggregates, the results which in themselves appear as one colossal achievement, but which are separable into an infinity of little things, all contributing to the greater whole; this has been proven true in business, so efficiency engineers say, and it is found nowhere more frequently so than in those automobile businesses which have achieved success.

Unconscious Use of Little Things.

Many dealers and garage operators do not realize that they have "made good" by making what to many would appear as insignificant items contribute their part to the upbuilding of their trade; but when they are asked about certain details, certain reasons for their having done certain things, the onlooker is quick to see that the little things are there in force and every one of them working to the limit.

Just where and how a car shall stand upon a salesroom floor may not appear consequential, as is evident from the helter-skelter arrangement which prevails in too many salesrooms; securing a large stock of cars often is the common desire, and any advantage as to their placing is lost sight of in the dealer's enthusiasm over his allotment. Too frequently he fails to realize that the prospective purchaser's first impression of the car may be lasting; if the latter acquires a prejudice at the first glance it may mean the loss of a sale, even though he be otherwise almost convinced, while if he be favorably impressed with the primary look it may ease the pathway to the little line at the bottom of the contract. But not all dealers incline to helter-skelter arrangements.

One day last week a visitor dropped into the establishment of the Franklin Motor Car Co. at Amsterdam avenue and West 73d street New York City, to pass the time of day with Glenn A. Tisdale, who in his six feet and then some represents the Franklin line of cars in the metropolis. The two, in conversation, drifted toward the new models which stood upon the floor and as the visitor looked he noticed that whereas there were three spacious plate glass windows in the front at the right of the doors, the cars, five in number, stood several feet from the windows and at an angle, and were moved backward so that the front of each car was near the center of each big pane of glass.

DISPLAYING MOTOR CARS TO ADVANTAGE—SALESROOM ARRANGEMENT THAT SECURED STUDIED EFFECT

Criticism That "Back-Fired."

Salesmanlike, the visitor, thinking either to help or to find a flaw in his rival's arrangement of things, said:

"Tisdale, you're wasting window space here. Why don't you move two of these cars to the back part of the floor and shove the other three close to the windows and straight alongside so that people will have

Digitized by Google

to see them as they go by on the outside and can get a good close view. It looks to me as if you ran them in here with as little labor as possible and left them in the place they happened to stop."

"'S that so?" ejaculated Tisdale.

"Looks that way to me," answered the visitor, thinking he had cornered his friend, and there was a trace of a smile on his face as he waited for the embarrassment to appear on the dealer's countenance.

Tisdale may be embarrassed at times, but he never yet was known to show it; he is too big physically to get the habit.

The Arrangement and the Reason.

"Well, let me tell you something, son," he replied. "You may be a fine big man down in your establishment, but you've made one mistake. Instead of making an easy job of placing these cars I put in some study and work on their positioning, and I put them where they are because I had a reason; moreover, your suggestion is respectfully rejected; the cars stay where they are."

The visitor laughingly asked the dealer to "elucidate."

"There's nothing to it except that I wanted the cars where we could show them to best advantage, and this is the place and arrangement."

"I don't quite follow you," replied the visitor, now really interested. "Also, isn't the placing of a car rather a small thing to spend a half a day figuring on?"

"Nothing is too small if it can help business. I'll show you how it works: The cars used to stand straight alongside, exactly as you suggested, but I could see it wasn't just right. Of course, you can see the cars from anywhere in the salesrooms, but there is more in seeing a car than just looking at it. We are nothing more than salesmen, and we want our goods to show up to best advantage—for the first look may mean a great deal.

Taking Advantage of the Light.

"Come here! From this point with the cars between you and the windows, you are so situated that the side of the car you see is in the dark, although it is not so very dark, either, but from this position the light from the window is in your face and the car is between you and the light. The cars don't show up as well as they might. There are details and refinements of finish that I can see and you can see, for we are automobile men, but anyone who is not in the business might not notice these things.

"Now step around here by the right front headlight of this first car. See the difference? The first thing that strikes your eye as you step up here is that long row of ten headlights on the five cars and with the five hoods in a line so that you can see every one of them, it looks rather pretty. In regard to the view of the whole group, just step outside. You see, as we walk south on Amsterdam avenue, the first glimpse is of the fronts of the cars, and then as we move along we swing, one by one, around to the side and get, first, a three-quarter-side and then a full side view—if we look back; and most passersby do look back. The same scheme works all the way down the line. I have had many people come in and say, 'What a fine looking lot of cars,' whereas if they were set up in a row, one after the other, and in close to the windows they would hardly be noticed. Another point is that while, with the other arrangement I could show but three cars, I am now displaying five, and the five look better than three.

"Let's go back inside again and start near the main entrance. The customer naturally steps around in front of the line of cars and as he gets over beyond the line of the left wheels the side of the first car comes into view. The light from the window falls full upon it and every detail of finish stands out. From here the interior is visible just enough to give an idea as to its finish and the customer can see more of it by stepping closer.

Prospective Buyer is Encouraged.

"Having looked at one car the customer, without being invited to step along, naturally moves on to the front of the next car and around to the left side and can walk down the whole line and see everything. If he walks around to the dark side, which is not so very dark either, he has seen the light side and is enabled to imagine any details of body finish which do not stand out as distinctly as they would in better light. The good impression has been made, if it is to be made at all, and a subsequent inspection of the darker side is not going to spoil it.

"With the cars straight alongside as you suggested, we would not have room enough to walk between them and the windows without being too close to appreciate the assembled lines and detail. Of course, with them that way we could see the whole side of the car; but look at the way they are now! The front of one car comes scarcely half way down the side of the next one and the whole side gets all the light it needs; there is room to walk between, too.

"Trick of the trade? It's nothing of the kind. Such things may be a part of the selling business, but they are far removed from anything that savors of trickiness. I am only doing what is right by the car and by the man who wants to buy one. In any store you may go into the public likes to see things attractively arranged, and the enterprising store manager sees that that is done. Goods are displayed so that they will get advantage of whatever light effects there may be. No man cares to be taken off into a dark corner of a salesroom and told that such and such is the case with the car and that it looks so and so and has such a finish and so on. What he wants is to see the car, and he wants to see it right.

Proper Display the Dealer's Duty.

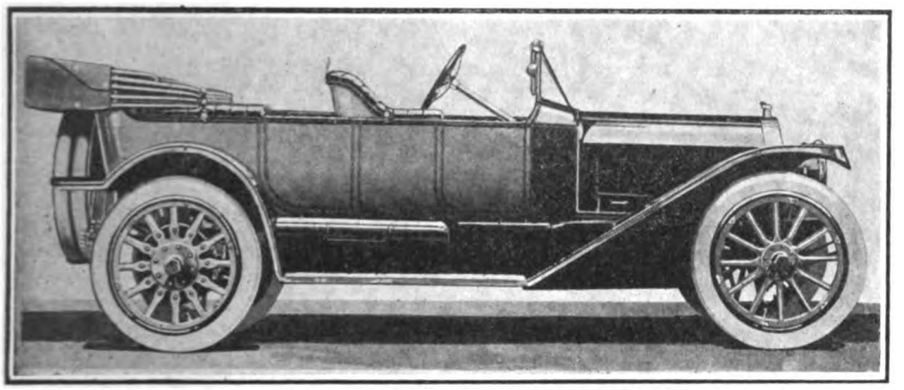
He wants to look at the car in its best form, and he wants to know that after he has seen it he has seen all there is desirable about it. If he gets a false impression about the car because of the way he sees it in the salesroom, and then some day meets the same car on the street and happens to discover that it is a lot better looking than he thought it was, or has certain features that failed to impress him fully in the salesroom, he gets a poor opinion of me and hands out a funny look every time he goes by the place. It's up to me to do the best I can by the car, inasmuch as the car can't say much for itself unless given the right opportunity.

"With the present arrangement this space at the end of the floor near the main entrance is where we meet most people when they step into the salesroom. If they wish to look at a car immediately, and most of them do, we step near that right front wheel and the customer gets his first view from a point where things show up to best advantage. Were the cars in closer to the windows and the customer tried to walk around them he would be so close that he would be looking right down on top of the mudguards, and there are few cars that present a good general outline from that angle. Things appear out of proportion and the customer's first impression is that of a whole lot of disassociated parts instead of an impression of an assembled whole of attractive outline.

"If we have less than five cars we arrange them much the same way and can get a fairly good layout, but what to me is the fine big sunburst effect is gained with five cars in a row. It just fills this way; with any other arrangement it would appear overcrowded and that always spoils everything."

Nothing That Doesn't Merit Attention.

"Well, do you really think it makes much difference?"



"To be frank with you, I can't tell you of a single instance where this arrangement is directly responsible for a sale, but I know it has helped with many sales, and so it's worth bothering with. Also, son, remember this, in any business there is nothing so small that it isn't worth some attention."

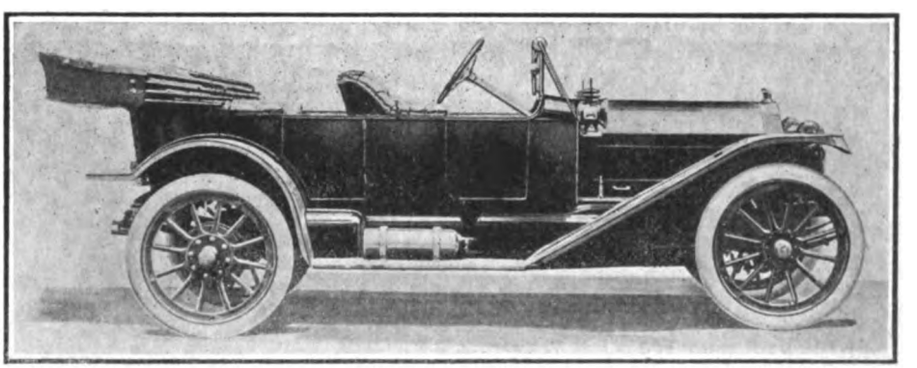
HAVERS "LITTLE SIX" NOW HAS BIG BROTHER

Michigan Manufacturers Supplement "6-44" with "6-55" Which Retains Havers Characteristics—Popular Prices Prevail.

Having had opportunity to study the requirements of its host of satisfied owners, the Havers Motor Car Co., of Port Huron, Mich., has profited by its past year's experience, and in addition to making such changes in the construction of the popular Havers "6-44" for the coming season as seemed advisable, has added another model to the line. It is a "six," of course—the Havers company never has made anything else—and though it is new, it is not so new as it might be, for it is nothing more than an enlarged version of the smaller "six," which during the past season has added to its prestige.

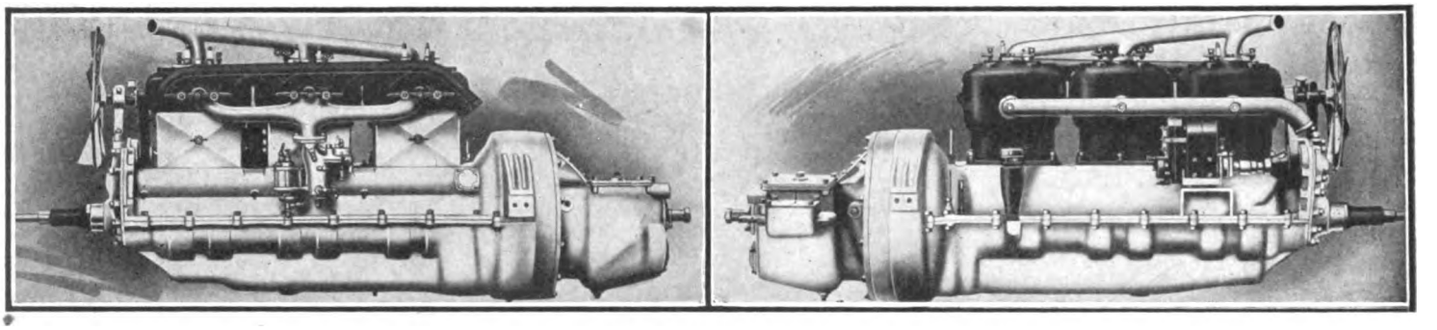


NEW HAVERS "6-55" FIVE-PASSENGER TOURING CAR

The new car is rated at 55 horsepower—its official designation is Series D, "Six-55"—and like its running mate it sells for a moderate price, $2,250, the figure including full equipment even to a combined electric lighting, engine starting and ignition system upon which the Havers company has had its engineers working for upward of two years. The price of the older "6-44" model remains at $1,850, where it was set when the car originally made its appearance, the figure including complete equipment as a matter of course.

In describing the slight changes which have been made in the older model, the phrase "minor refinements" is particularly apt. For instance, the side lamps, where the electric system is specified—it may be had on the older model, at the option of the purchaser, though at a slight increase in price—are set in flush with the dash; the spare tires have been relegated to a less conspicuous and more convenient position at the rear of the tonneau; the gasolene feed has been made more positive by supplying the fuel under pressure; considerable attention has been given to refinement of finish, and the results are shown by the smooth exterior, the clear running boards and the well-blended lines of the body and the bonnet; and last but not least, the whole chassis has been fine-tooth combed in an endeavor to locate weaknesses or places where the already high factor of safety could be increased to advantage. The result has been a slight strengthening of several parts upon which unusual strains are placed in the course of a season's touring over give and take roads.

The larger model, as already has been mentioned, is new all the way through, and as it has been built upon experience gained in the production of the "6-44," of which it is practically a duplicate in everything except size, it is but natural that it should reflect many of the distinguishing marks of its prototype. The body is larger and roomier, of course, and provides more than ample space for the comfortable disposition of five passengers. It is made in but two types, the five-passenger touring car and a low rakish appearing roadster which has all the earmarks of a racing car combined with the comfortable seats and luxurious cushioning of a touring car. The seats in the roadster—it is styled the Knickerbocker Speedster—are tilted backward at a comfortable angle, and the steering column has been raked aft to bring the wheel within easy grasp of the operator. The mudguards are slightly different from those that are used on the touring model, and their lines lend an air of "speed" that is undeniable. The gasolene supply is carried in a big cylindrical tank behind the seats in true racing car style, and, as in the other models, the running boards have been bereft even of tire irons; tools and supplies are carried in built-in boxes, lock equipped, that fit close to the frame and serve on occasion as steps. Tires are carried at the rear.

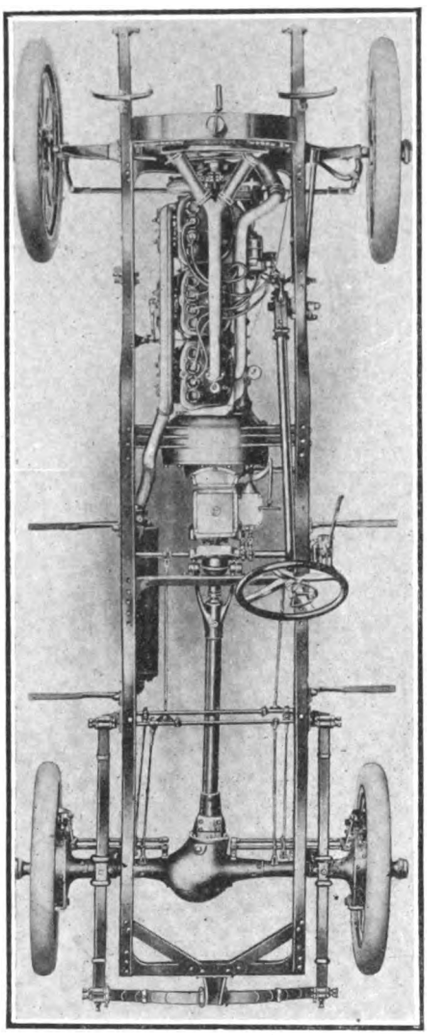


In the general design of the motor in the new car, Havers principles, laid down some three years ago, have been adhered to with scarcely a deviation from previous construction. As a matter of fact, the motor in the new car is so like the motor in the older model that a single description will serve for both, and as there have been no alterations in design the description resolves itself automatically into a recount of the specifications. The cylinders are cast in pairs, and the bore and stroke are such—4 inches by 5 inches—as to leave little room for doubt regarding the class to which the motor belongs. Bearings are unusually liberal, the flywheel bearing, for instance, measuring 4 inches and the front bearing 3½ inches, and the connecting rods have been designed with a view to obtaining the highest possible factor of safety consistent with light weight.

REVISED "EDITION" OF THE HAVERS "6-44" MODEL

Cooling is effected by water circulated by means of an efficient type of centrifugal pump. As an indication of the thoroughness of design, the water jacket space surrounding the cylinders and valve pockets is three-quarters of an inch in depth. Ignition, as has been mentioned, is a function of the combined electric lighting and engine starting system. On the smaller engine a Bosch high tension dual system is employed except when the combination electric system is specified. By way of ensuring proper and positive lubrication, the manufacturers utilize a combined force feed and splash system in which the oil is pumped from a reservoir in the crankcase through a sight feed glass and suitable

Digitized by Google



BOTH SIDES OF HAVERS "SIX" ENGINE, SHOWING UNIT CONSTRUCTION AND CARBURETTER AND MAGNETO LOCATIONS

ducts to the main bearings, whence it collects beneath the connecting rod big ends and is splashed over the cylinder walls and auxiliary bearings. "Mixture" is supplied by a Stromberg carburetter. Motor, clutch and change speed mechanism form a rigid unit which is supported at three points on the main chassis frame, thus providing for a certain amount of frame weaving without detrimental results to the power plant or transmission elements.

From the motor, power is transmitted through the intermediary of a multiple disk clutch, the alternate disks of which are faced with Raybestos. The change gear mechanism provides three speeds forward and reverse, control being selective by means of the orthodox hand lever and H-gate quadrant. The gears are formed of chrome vanadium steel, are wide of face and are carefully heat treated. Both the main shaft and the lay shaft are mounted in large diameter annular ball bearings. Clutch and gearset specifications are the same for both models, due allowance being made for a difference in size commensurate with the different powers of the two engines. In fact, all the other constructional details also are alike, the only difference being in the size of the parts, which are larger and heavier in the new model.

In conformity with the growing tendency toward such construction, the propeller shaft is enclosed in a substantial torque tube, which serves to absorb the twisting strains coincident to driving and braking. The torsion tube is not designed to transmit the driving strain, however, separate rods being provided for this purpose. The torsional strains are carried through the frame by means of a heavy yoke carried on a cross frame member. A single universal joint and a slip joint provide the necessary flexibility and assist in maintaining the proper relationship between the rear axle and the frame. The rear axle is of the full-floating type, in which the driving shafts are 1½ inches in diameter. They are formed of nickel steel. The front axle is drop forged, I-beam in section, and has the steering yokes drop forged integral. The frame is double dropped, and is formed of pressed steel in channel section; the width is 30 inches in front and 31½ inches in the rear.

Both sets of brakes are located on the rear wheels, and both are equipped with

HAVERS CHASSIS IN PLAN

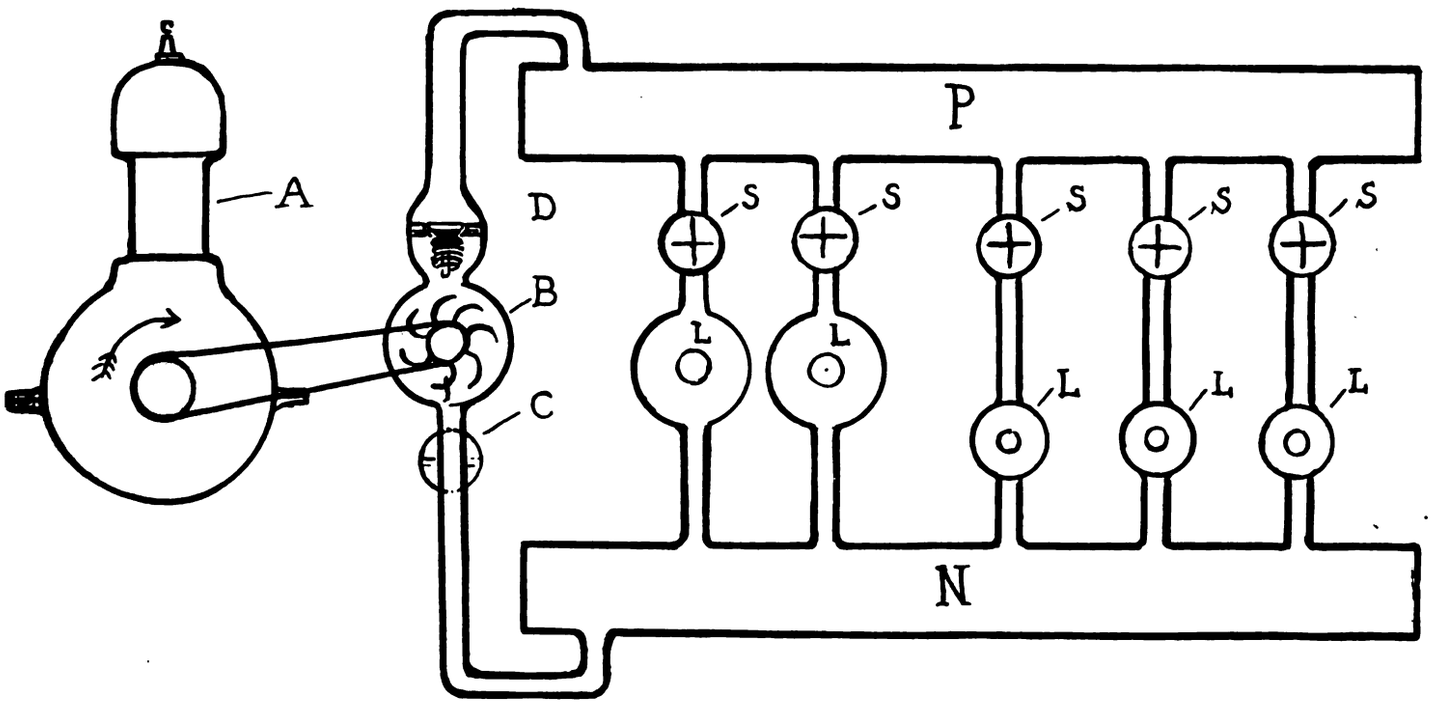
equalizing devices. The steering mechanism is of the worm and full wheel type, which construction was chosen because of the facilities for adjustment which are afforded; the gear is irreversible. The wheels are standard artillery type and are equipped with either Baker or Firestone quick-detachable-demountable rims, at the option of the purchaser, tire sizes being 36 x 4 inches both front and rear. The wheelbase of the large model is 128 inches and of the smaller model 122 inches, the tread being standard, 56 inches, in both cases.

As has been stated, the same general specifications apply to both the older model and the new car, with the exception of a difference in the size of the parts. The motor in the "6-44," for instance, measures 3¾ inches bore and 5 inches stroke, the nominal horsepower rating being 44. Equipment in both cases is complete and includes Gray & Davis lamps finished in nickel and black enamel, Havers mohair top with patent inside curtains, automatic ventilating windshield, electric lighting, starting and ignition system (where specified in the smaller model), horn under hood, foot, coat and robe rails, tire irons with extra demountable rim, combination speedometer and gradometer, and the usual supply of tools, spare parts, tire repair kit, and so forth.

Healing Deep Scars in Body Work.

Deep scratches of indentations on the body work of a new car cannot be made imperceptible simply by refinishing with paint and varnish. In cases of the kind, the injured portion should be soaked in warm water for a time, care being taken not to let the water dry, or a white filmy spot will be the result. While the work still is warm, a filler consisting of equal parts of beeswax and rosin should be run into the crevice. After the filler has had sufficient time to set, it should be finished off with very fine pumice and water, after which a smoothly applied coat of paint and a couple of coats of varnish will complete the task and should leave no marks.

Using Windshield to Assist Ventilation.



Even though ventilators generally are supplied to add to the comfort of those who drive cars equipped with front doors, the front compartment of this type of vehicle sometimes becomes "stuffy." The condition can be considerably relieved, where a rain vision windshield figures in the equipment of the car, by tilting the top of the shield outward so that it directs a current of air downward into the compartment.

THE ANALOGY BETWEEN ELECTRICITY AND WATER

The Electric Lighting System Likened to a Water Pumping Plant in a Manner to Make Plain the Rudiments of Electricity and the Operation of Lighting Apparatus—Magnetos, Dynamos and Motors Contrasted, Defined and Explained.

For some not altogether inexplicable reason, the word electricity, and what it stands for, always has inspired a certain awe in those whose educations have been neglected to the extent that even a brief study of its peculiarities and properties has been omitted from the curriculums. And as a matter of cold fact, electricity really is more or less mysterious and awe-inspiring in its effects. Savants who have devoted their lives to its study admit it. That it should be mystifying to them, however, is logical, for in their investigations they have delved below the surface and have uncovered phenomena of which the outside world seldom is apprised. But to the person of even average intelligence the surface aspects of electricity, which are all that really are required for everyday use, should be perfectly plain, or at least should require scarcely more than a superficial examination to lay their secrets bare.

MAKING PLAIN A DYNAMO ELECTRIC LIGHTING SYSTEM WITH THE AID OF A WATER POWER ANALOGY

Simplicity of Electrical Power.

For instance, where can there be found a simpler form of power and one that is more easily understandable than a common dry cell and a couple of pieces of wire? The dry cell is composed of certain elements packed in a moist substance and contained in a metal cylinder. The action of the elements one upon the other results in a flow of electricity along the wires. Nothing could be simpler. It is not necessary to know exactly why chemical action makes electricity any more than it is necessary to know why the wind blows, though one is as simple a result as the other, and both may be used for what they are worth without compunction or investigation.

Complexity Does Not Change Principles.

The dry cell, of course, is an inordinately simple example. Which probably accounts for its acceptance without wonder or fear by nearly every one. It has been used a very long time; its novelty has worn off and due to its reliability and ability to exist and carry on its function without the slightest attention, little other than passing thought ever is conferred upon it. Now even the dry cell is passing out of use, as far as automobile work is concerned, and very much more modern and a little more complicated electrical apparatus is taking its place and assuming its duties with results which so far have proven highly gratifying to a by no means small number of persons.

That particular apparatus is embraced in the many different—fundamentally, they are the same, or practically so—electric lighting, ignition and engine starting systems which within the past three or four years have made their appearance on the market and which within only the past few months have become such an important factor in the automobile and allied industries. Strange as it may seem, however, though the use of electricity for auxiliary purposes about an automobile is growing by leaps and bounds, until at present there are very few cars which are not equipped with electric lights, even if only a storage battery is supplied for energy, knowledge is not growing in proportion; or it may be that the much greater use of electricity at present has served but to draw attention to the existing ignorance which prevails.

Usefulness of a Little Learning.

It has been said that a little learning is a dangerous thing. It was Alexander Pope who said so in his essay on criticism. By

Digitized by Google

the same token, a little learning may be a very excellent thing, provided that a person who knows a little about a piece of machinery may feel inclined, to his own discomfort, to tinker with it in case of trouble, whereas he who knows nothing at all about it probably will be inspired with a healthy fear of it and leave it alone to its own very evident good. But if the man who knows a little about his machinery knows that little well he is in a fair way to eliminate the trouble, and the repair bill, incidentally, before the factory mechanic called by the ignorant one nas reached the spot. It all hinges, however, on the proper use of what little knowledge may be at the command of the individual, and it may be assumed for all practical purposes that the individual who does know a little is intelligent enough to use his learning to his own advantage. At least he will be at an advantage over the individual who knows nothing.

Electricity Likened to Hydraulics.

With regard to the electrical equipment that forms so valuable a part of modern cars, a complete knowledge of electricity obviously is unnecessary. But a knowledge of the surface features is necessary. Or rather it is not exactly necessary, for, thanks to the painstaking efforts of designers, such apparatus as has been placed on the market has been highly perfected and seldom if ever requires attention, but is a wise precaution. If a man understands a piece of machinery, he can get just so much better results from it whether it ever requires attention or not.

To the owner of an electrically lighted and started car, intimate knowledge of the workings of the system is valuable, of course. And if it is valuable to the owner it is infinitely more valuable to the dealer, for he stands as the visible connecting link between the owner and the factory, and knowledge of this kind assuredly spells service, and the growth of such systems absolutely demands such knowledge, if he is to "hold his own." The dealer ought to be able to diagnose simple troubles should they arise; he ought to be able to make minor repairs or adjustments—and particularly adjustments—if necessary. Nor does such work entail a post graduate course in electricity. Every electric lighting or engine starting or ignition system, or combination system is simple if trouble is taken to look at it in the right light and not to judge all as being highly complex just becouse their parts are small and more or less jumbled together and enclosed in a compact case. Similarly, every system is essentially the same as regards the functioning of its parts.

In endeavoring to make plain to the layman the inherent simplicity of one particular electric lighting system, a manufacturer of almost international repute has adopted a scheme that is as novel as it is efficacious. The beauty of the example is that it is not alone applicable to this one system but applies to all. None but the essential elements are dealt with, and the explanation is such that anyone easily can understand it.

Similitude Diagrammatically Explained.

Briefly, his method is to liken the electric lighting system to a water system. The storage battery represents two water tanks (P and N in the accompanying illustration); the engine (A) drives the dynamo (B) which is represented by a water pump; a simple valve (D) serves to prevent the water from flowing from the tanks back to the pump, and represents the automatic cut-out with which all electric systems are equipped; a stop-cock (C) represents the switch and shuts off the flow of water; the lamps (L) are represented by water motors and are controlled by means of additional stop-cocks (S).

In theory, such a water system would work about as follows: Assuming the water tanks to be partly filled, the upper tank representing the positive plate of the battery and the lower tank representing the negative plate, the motor, if started, would cause the water motor (B) to force the fluid up the pipe to the upper tank from the lower tank, the water representing the electricity and the pump the dynamo. In this analogy, of course, the pump does not originate the water, though in the electric system the dynamo actually creates the current. In the water power illustration, the water pump creates the flow of water which represents the electric current.

Carrying Along the Parallel.

In the pipe which leads to the upper tank there is an automatic valve which closes immediately the pressure of the water in the tank exceeds the pressure of the water created by the pump, as, for instance, when the pump ceases to operate. Similarly, the valve opens to let the water through when the pressure created by the pump exceeds the pressure of the water in the tank, the action of the valve being exactly similar to the action of an automatic electric switch in an electric system. From which it may be seen that when the valve is closed the pump is doing no work and the only effort required to operate it is that which is necessary to overcome friction; the same condition obtains in an electric system when the automatic switch is open. The dynamo takes no power, theoretically, except when it is actually performing work. The valve, of course, corresponds to the automatic cut-out in an electric system, which prevents the current in the battery flowing back through the dynamo when the motor stops or the dynamo is running so slowly that the pressure of current in the battery exceeds that generated by the dynamo.

The electric current is represented by the water in the system, of course, and as the water may be discharged so may the electric current be discharged. In the example, the lamps are represented by water motors, the head lamps by large ones and the side and tail lamps by small ones. If the water motors were operated by the water pressure, they would perform work and in doing so would absorb power. Similarly, if the lamps are lighted they perform work (in illuminating the road) and consequently they absorb power and lower the pressure in the battery.

Resistance in Pipes and Wires.

The pipes in the water system represent the wiring in the electric system, and right here the analogy can be made readily illustrative of the necessity for very careful wiring, and the use of material of adequate size. If the volume of water in the tanks which represent the storage battery is to be discharged within a certain time, then piping of a specified diameter must be used. If the piping is too small, either a longer time will be required for the water to discharge or much energy will be lost through the friction of the fluid as it passes through the pipes. In other words, the "head" will be less if the pipes are small than it would be if the pipes were of the proper size. Very near exactly the same condition obtains in an electric system when the wires which are used are not of adequate size. To carry a certain current the wiring must be of a certain size. If the wires are too small they introduce resistance to the flow of the current and consequently cause a drop in potential. That is to say, if the wires are too small the voltage of the current, or the pressure or rate of flow, will be restricted, and if the wires are very much too small, the current in passing through them will cause them to heat. As the generation of heat presupposed the application of energy, the heating of the wires is prima facie evidence of a loss of power.

Plumbers' Joints and Insulation.

The water power analogy may be carried still further, and with equally as illuminative results. Thus, for instance, if the joints in the piping in the water system are not properly "made up," as plumbers put it, leaks will develop and a loss will ensue. It is exactly the same in an electric system, the only difference being that the insulation of electric wiring to preclude the

Digitized by Google

possibility of leaks requires infinitely more care than does the making up of water connections. In fact, it has been said, and with perfect truth, that it is impossible ever to so insulate electricity that absolutely no leak results. In low tension currents, however, such as obtain in electric lighting and engine starting systems, it is quite possible to obtain insulation which is to all practical intents and purposes perfect. It is in the insulation of high frequency currents and high voltages that difficulty is experienced in properly insulating the conductors.

Electrical Pressure and Its Effects.

Given the proper size of wiring and also efficient insulation such as is in general commercial use at present and provided care is taken to prevent accidental breakages and chafing which will cause short circuits little difficulty should be experienced in confining the electricity used for automobile purposes to its intended and legitimate uses.

In enlarging upon the water power theory, the pressure in the water tanks and the pressure generated by the pump has been likened to the pressure represented by the voltage of the battery or of the dynamo. Briefly, voltage means the pressure or tension of the current. In the high tension magneto, for instance, the voltage is "stepped up" through the intermediary of a transformer until it is very high, hence the use of the words "high tension current." Because the voltage or pressure of the current is high, it may be assumed for the purposes of example to have acquired considerable velocity. If a small round ball is rolled very rapidly it will leap over a small depression or an opening in the surface upon which it is rolled. Its momentum is sufficient to carry it over the hole. With the high tension current it is exactly the same. Its stored up energy is sufficient to cause it to leap the gaps of the spark plugs Hence, with high tension currents, which always are seeking a means of escape to the ground, it is more difficult to obtain adequate insulation than it is with low tension currents, the pressure of which is comparatively low.

Voltage and Amperage Elucidated.

The volume of water that flows through the pipes in the water power system, on the other hand, represents the amperage of the electrical system. The ampere is the international unit of electrical volume. From which it becomes apparent that for a given amperage the wiring requires to be of a size sufficient to carry it. The pressure of the current, or the voltage, remains the same regardless of the size of the wire that is used. vide, the induction coil in which upward of 100,000 volts is carried by wire as fine, or finer, than an ordinary hair. The amperage of the induction coil, however (the amperage of the high tension current) is practically nil. In fact, it can be measured only in hundredth parts of an ampere.

But in case the amperage is higher then the size of the wiring must be increased just as it would be necessary to proportion the size of the pipes in a water system to the volume of water required to flow through them in a given time. If, as has been explained, the wiring is too small, much of the current will be lost in generating heat which will be dissipated and cannot be recovered. Incidentally, the heat in itself forms a menace, for it increases the fire risk. Of course, even where wire of adequate size is used, the danger of fire, or of damage to the apparatus, is minimized by the insertion of fuses in the line. The fuses "burn out" when the current is short circuited and the wires themselves ordinarily would become heated and thus break the flow of current.

Storage Batteries Charged by Dynamos.

If, in the water power analogy, no pump were provided, the water, in operating the water motors which represent the lamps, soon all would flow from the upper tank to the lower tank. Similarly, if in the electrical system no dynamo were supplied, the energy in the battery soon would become exhausted and the lamps would go out. From which it becomes apparent that a dynamo is an essential part of any such system. Where no dynamo forms part of the system it then becomes necessary to rely upon some outside source of current recharging the storage battery. This must be either a primary battery or a dynamo, and inasmuch as primary batteries are not suitable for recharging purposes, owing to the exorbitant expense of maintenance, dynamos perforce must be used. The only difference between the large dynamos which generate current for street lamps and trolley cars, etc., and the dynamo which is used for automobile lighting purposes is in size. The one is heavy and massive and operates at slow speed, and the other is small and compact and operates at comparatively high speed.

All dynamos operate on the same principle, and that principle is neither complicated nor difficult to understand despite the general misunderstanding on this point. If a coil of wire, wrapped around a soft iron core, is rotated within a magnetic field, a current of electricity will be generated in the coil. In a magneto, for instance, the magnetic field is supplied by permanent magnets; the armature is formed of a coil of wire on a soft iron core. But the strength of the current that it is possible to generate is dependent to a certain extent on the strength of the magnetic field. For ignition purposes heavy currents are not necessary, and consequently permanent magnets of comparatively small size serve the purpose.

Why Dynamos Have Electro-Magnets.

Where heavier currents are necessary, however, as in electric lighting and engine starting systems, permanent magnets are not sufficient in the sizes which can be used. If permanent magnets of sufficient size to provide sufficient field strength could be used, then a magnet machine, or a magneto, would serve the purpose. It is impossible to magnetize a piece of iron beyond a certain point. When that point is reached the iron is said to be magnetized to saturation. The strength of the magnetic field of a permanent magnet therefore is dependent upon the size of the magnets.

In a dynamo, however, the magnetic field is made to order, so to speak. That is to say, the magnetic field is generated as it is required and may be assumed not to exist except when the machine is running. Instead of permanent magnets being employed, the strength of the magnetic field of which is limited to the magnetic saturation of the iron, field pieces of soft iron wound with many turns of wire are used in a dynamo. When a current of electricity is passed through the wires the soft iron cores become magnetized and their magnetization is in direct proportion to the current which is passing through the wiring and the number of turns of wire there are around the cores. For instance, if a given permanent magnet will lift a certain weight, it may be made to lift a very much greater weight simply by winding it with a number of turns of wire and passing a current of electricity through the wire. Consequently, a comparatively small electromagnet will do the work of a very much larger permanent magnet. Which, briefly, is the raison d'etre of the dynamo. A magneto, so called because it is formed of magnets—permanent magnets—differs from a dynamo in that it has no field winding; otherwise the magneto is substantially the same.

Differences in Dynamo Designs.

Needless to say, there are a great many different styles and types of dynamos, each of which has been developed to perform a certain class of work. There is great variety in field winding and in armature winding, and machines generally take their name from their method of winding. Thus, for instance, a shunt wound dynamo is one in which the field winding is shunted across

Digitized by Google

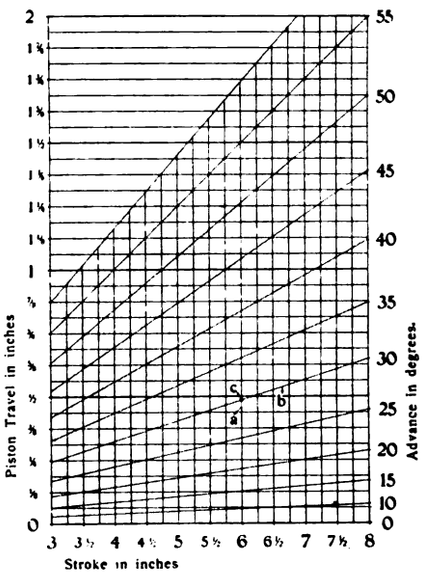
the brushes which collect the current from the armature; in a series wound machine the field winding is placed in series with the armature; similarly, a compound wound machine is a composite of the two. The latter by reason of its many advantages for all classes of work is coming into more general use and it is on this principle that many of the electric lighting dynamos which are designed for automobile work are constructed.

Reversed Dynamos Run as Motors.

A word in reference to dynamos and motors: Every dynamo irrespective of its method of winding—this does not apply to alternating current dynamos, which never are used for automobile work and consequently legitimately may be left out of the discussion—will operate as a motor provided a source of current is available. Shunt wound machines invariably operate as motors in the same direction as they generate current; series wound machines, on the other hand, invariably operate as motors in the opposite direction to that in which they generate current. It is by reason of the fact that every dynamo is an embryo motor and vice versa that combination electric lighting and starting systems using but one motor-generator unit are possible. And despite dissertations to the effect that a dynamo cannot be made to operate efficiently as a motor, or that a motor cannot be made to perform the work of a generator with any degree of efficiency, such is not the case. There may be some slight loss of efficiency—in fact, there must be a loss—but in the case of the apparatus commonly employed for automobile work such losses as occur are so small as to be negligible.

"Shoulders" That Lead to Mischief.

Any sort of a shaft, or spindle, or stem that works in a guide and has longitudinal motion is apt to wear down more or less where friction occurs, leaving a shoulder at each end of the travel. In some cases this shoulder may interfere with operation, as, for instance, in the case of the automobile air-valve of a carburetter, and for this reason a lookout should be kept for a shoulder where it is possible for one to develop.



Ready Method of Removing Stud Bolts.

Stud bolts sometimes are formed with only a short shank, so that the use of a wrench in connection with their removal involves the risk of marring the threads. In such a case, the bolt readily can be removed by screwing a nut about halfway down the bolt and locking it in place with a locknut. A wrench then can be applied to the lower nut and the stud easily be removed.

SIMPLIFIED METHOD OF TIMING THE MAGNETO

Easily Employed Diagram That Helps to Determine the Proper Firing Point—Its Use Made Plain.

Barring the desirability of as nearly perfect carburation as is possible, it is doubtful if there is any other factor which has a more definite bearing on engine efficiency than the timing of the ignition spark. Where set spark ignition is provided, there can be little variation other than that afforded by the natural range of advance of

BOSCH MAGNETO TIMING CHART

the magneto, but where hand-timed ignition is employed, there is a possibility that troubles may arise which will require that the timing apparatus be overhauled and a more advantageous setting of the magneto obtained. Often, also, after an engine has been overhauled, several times it will be found of benefit to examine the timing apparatus and to reset it according to the instructions of the magneto manufacturer, for accurate timing is essential if efficiency is to be expected.

As a general rule, magneto manufacturers instruct that magneto installations should be so arranged that the contact breaker opens at a certain point corresponding to a predetermined angularity of the crank throw from vertical, the relation of piston travel to the rotation of the crankshaft depending upon the stroke and the length of the connecting rod. For all practical purposes, however, the length of the connecting rod may be omitted from the calculation, for, except in the case of extreme variations, this factor has so slight a bearing as to be practically negligible. It is a comparatively simple matter, of course, to determine the amount of piston travel in inches by means of a wire inserted through a petcock. It is not so simple, however, to determine accurately the rotation of the crankshaft, and it was to obviate the necessity for lengthy computations that the accompanying diagram, which has been developed by the Bosch Magneto Co. was constructed. With its aid, it is a simple matter to determine quickly the angularity of the crank throw from vertical provided the stroke and piston travel in inches are known.

In the diagram, the relation between the piston travel and the connecting rod length is as 1:4.5, which is the ratio in general use. The vertical lines indexed at the bottom give the stroke in inches, and the slanting lines with the figures at the right give the rotation of the crankshaft in degrees. The horizontal lines and the figures at the left indicate the piston travel in inches. For an example of the use of the diagram, let it be assumed that the stroke of a given engine is six inches, and it is desired to find the piston travel for an advance of 30 degrees.

The vertical lines for the desired stroke are indicated at the bottom, and tracing upward until the slanting line indexed as 30 degrees is reached, the piston travel in inches is indicated at the left side at the horizontal line which cuts the 30-degree slanting line. In this case the figure is slightly less than ½ inch. Consequently in setting a magneto for an engine of six inches stroke, it is merely necessary to insert a wire in one of the pet-cocks and turn the flywheel backwards past top dead center until the piston has receded slightly less than ½ inch. This corresponds to a rotation of thirty degrees of the crankshaft.

Nyberg Produces First Racing Car.

Signifying not that they have entered the racing field but that they have listened to the urgings of one of their aggressive agents on the Pacific Coast, the Nyberg Automobile Works, of Anderson, Ind., just have completed the first racing car that ever bore the name Nyberg. In its general characteristics, it follows the Nyberg lines, but is marked by an unusually short wheelbase of 108 inches, utilizing a long stroke 40 horsepower motor, 4⅛ x 5¼, and is geared 2½ to 1. In a tryout, it developed a speed of 78 miles an hour. After its first appearance in competition in St. Louis, on September 29, the car will be shipped to McKee & Scott, at Fresno, Cal., the Nyberg agents for whom it was built and who plan to enter it in races this fall.

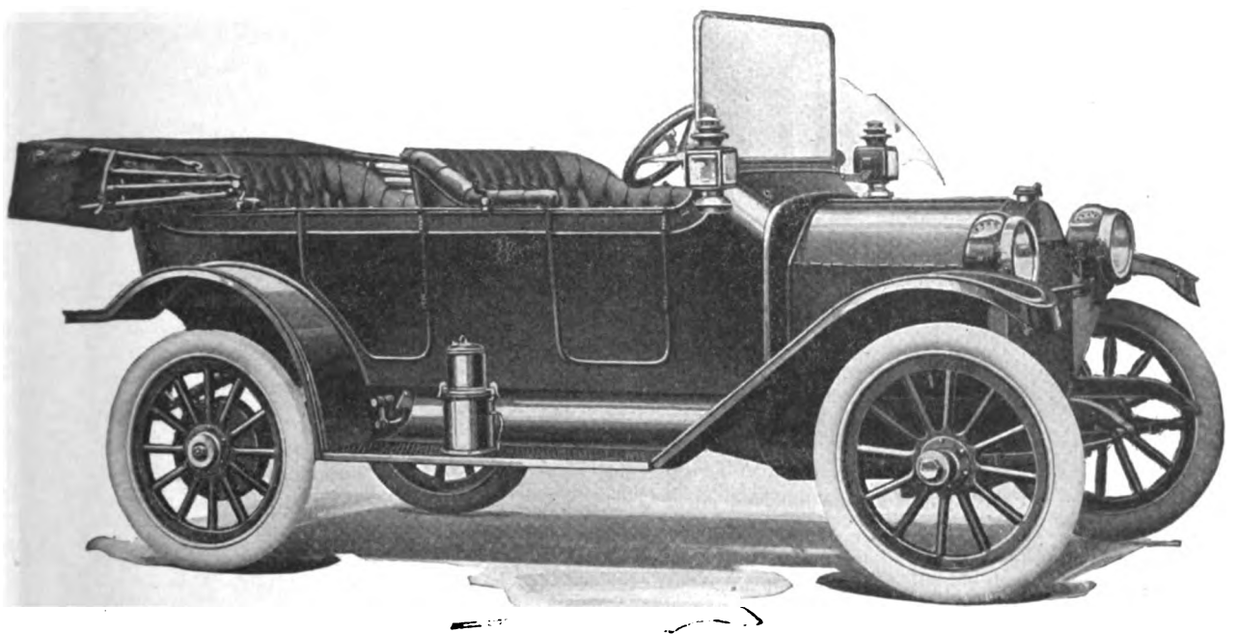
FEW ALTERATIONS IN NEW BRIGGS-DETROITER

Refining Efforts Centered on Reduction of Weight—Pressed Steel and Aluminum in Place of Cast Iron.

Refinements and slight alterations which mark the revised "edition" of the Briggs-Detroiter, produced by the Briggs-Detroiter Co., of Detroit, are not such as to hide the characteristics which from the first made the car one of the most appealing creations in the popular priced class. Like their predecessors, the new models are built upon a single chassis, and it might require a very diligent search to uncover the differences in construction. There are differences, however, and even though they are slight their incorporation serves as an indication of the thoroughness of the manufacturer in seeking to improve a car that already was undeniably good and which established a name for itself in a remarkably short space of time.



Specifically, the greatest attention in revision has been directed toward a reduction of weight to the minimum consistent with an ample factor of safety. To this end, the toe board, which heretofore has been constructed of wood, now is made of aluminum, which, in addition to enhancing the appearance of the car, serves also to strengthen it and to reduce weight. Pressed steel enters into the construction of the car to a greater extent than before, and in this way efficiency is raised for the simple reason that weight is reduced, the immediate effect being that the engine has less work to perform in providing energy to transport dead weight. For instance, brake drums and flanges now are of pressed steel, the substitution of this material having been carried to a great many other parts, including the oil reservoir beneath the crankcase, which heretofore has been made of cast iron. Other changes which have been made and which are concerned more with the comfort of passengers, include the addition of a new form of ventilators and a slight elongation of the upholstery on the sides of the tonneau.

The three models which are listed are identical with the exception that there is a difference in equipment. Model A, which sells for $850, is equipped with a top and side curtains and dust cover, windshield, the usual complement of acetylene and oil lamps with a generator, tire repair kit, horn, jack and tools. Model A1 lists at $900, the difference in price being accounted for by the more complete equipment, which includes, in addition to the foregoing, quick-detachable-demountable rims, Prest-O-Lite tank, Stewart speedometer and tire irons. The same equipment is listed for model A2, which also sells for $900, with the difference that an Exide storage battery and combination electric and oil lamps take the place of the Prest-O-Lite tank and acetylene lamps. The bodies in each case are arranged to carry five passengers with a degree of comfort that seldom is excelled.

The particular feature of the Briggs-Detroiter—the feature which serves to distinguish it as a particularly valuable $850 worth—is the incorporation of a number of constructional details which seldom find place on cars selling for less than twice its selling price. To enumerate some of the more prominent ones, there is the unit power plant, the platform rear springs, the more than ordinary liberal use of ball bearings, the long stroke motor with its enclosed valves and duplex lubrication system, the substantial multiple disk clutch and the full-floating rear axle. All of which is combined in a manner that reflects undoubted cleverness of design.

The engine, which is literally the heart of a car, is of the four-cylinder four-cycle type, with the cylinders cast in a single block in order to lend rigidity and strength to the unit. The flywheel is enclosed in an extension of the crankcase and the change gear mechanism, which provides three speeds forward and reverse, selectively controlled, is enclosed in a casing which bolts securely to the flywheel housing. Both the shafts in the gearset are carried in large annular ball bearings. By way of obtaining the advantages of the long stroke motor, while at the same time retaining the accelerative powers and "pull" of the more nearly "square" motor, the ratio of bore to stroke has been set at a conservative limit. The bore is 3⅜ inches and the stroke is 4¼ inches. One of the interesting points of design is that the inlet passages project from the inlet side to the exhaust side, the carburetter therefore being located on the opposite side from the magneto, which minimizes the fire risk, and the mixture being slightly warmed before entry into the cylinders.

For ignition a high tension Bosch magneto with set spark point is employed, the assumption being that the average driver scarcely can be expected to know the exact

BRIGGS-DETROITER, MODEL A, WHICH SELLS FOR $850, FULLY EQUIPPED

Digitized by Google

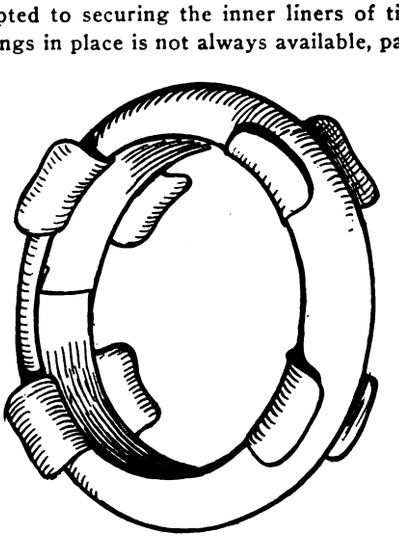
place in the stroke of the piston when ignition should take place in order to obtain maximum efficiency. Cooling is by water circulated by the thermo-siphon system. In the lubrication system, the manufacturers have not been content to rely entirely upon ordinary splash. Instead, the splash system has been supplemented by a pump system in which the oil is pumped from the crankcase reservoir through a sight feed glass on the dash to the front end of the crankcase, whence it percolates to the compartments and also to the flywheel housing. The flywheel is designed to throw the oil over the clutch parts and backward to the gearset. The whole power plant is supported at three points on the main frame.

The control system has been made as simple as it is possible to make it. The steering wheel, operating through a heavy worm and sector, is located at the left side in conformity with the growing practice in that respect. Throttle control is located at the top of the steering column. The usual emergency brake lever has been eliminated, its place being taken by a pedal. The left pedal serves to disengage the clutch and also to apply the service brakes. Both sets of brakes are located on the rear wheels, the service brake drum measuring 14 inches in diameter. The rear axle is of the full-floating type, thoroughly ribbed and braced, and is calculated to withstand many times the weight represented by the loaded car. One of its features is that it has been constructed with the experience of leaky axles in mind. The housing is so constructed that it is a physical impossibility for the grease to leak out and run into the brakes.

The frame is of channel section 33 inches in width at the rear and 29 inches in width at the front. By reason of the narrow forward section the car may be turned completely around in a 25-foot circle. The wheels are the regulation wooden artillery type and are shod with 32 x 3½ inch tires. Front springs are semi-elliptic in form and in order to prevent twisting strains and eliminate side-sway are located directly beneath the side frame members. The rear springs, as already mentioned, are three-quarter platform members, all shackles being provided with liberal sized grease cups.

The body of the car is unusually roomy, the front seat being 35 inches in width and the rear seat measuring 42 inches. Dimensions between the seats and between the front seat and the dash also are liberal, the result being that five persons have no difficulty in arranging themselves comfortably. The upholstery is deep and its outer covering is formed of high grade hand-buffed leather.

Tool for Removing Piston Ringes.



Under ordinary conditions the removal of a set of piston rings is what a repair man calls a "mean job," for it is not only a somephat difficult thing to do, but it entails

no little risk of breaking the brittle cast iron circles. Replacing them is almost as bad. A tool has been specially designed for the purpose, however, by the Sword Mfg. Co., Inc., of New London, Conn., and by its use rings can be removed easily and with a minimum of risk of breakage, and can be just as readily replaced. The device resembles nothing so much as a pair of glove stretchers; that is to say, it has long jaws and a short handle, and the jaws spread apart when the handles are brought together. The tips of the jaws are shaped to take the splits of any variety of piston ring. In use, the end of the tool is inserted in the split of the ring, when pressure on the handles spreads the ring, which can then be slid off the piston. The rings are replaced in their grooves quite as easily, obviously.

Tire Liner That Vulcanizes Itself.

The particular kind of cement that is best adapted to securing the inner liners of tire casings in place is not always available, par-

ticularly in small towns, and for this reason delay and inconvenience may be caused when a casing requires re-lining. To meet just such emergencies, the Hagstrom Bros. Mfg. Co., of Lindborg, Kansas, has developed and marketed a self-vulcanizing inner liner that is complete in itself, requiring no special cement, for the reason that its outer surface is covered with a coating of pure raw rubber cement. In applying the liner the cemented surface is washed with gasolene to remove the protecting soapstone, and the inner surface of the casing is cleaned in the same fashion, after which the casing is inserted. There are eight flaps projecting from the edges of the liner, four on each side, spaced equally, and these are turned up over the beads of the tire, where they are gripped by the clincher. The cement is vulcanized automatically by the ordinary heat of the tires generated on the road.

Spark Tests That Endanger Insulation.

A good spark coil with a normal current flowing through the primary winding is capable of producing a spark of considerable length in the open air—much longer than is required for even the hardest service in ignition work. It is not intended to do this, however, and when testing the spark with plugs removed from the cylinders the spark should not be forced to jump more than about ⅜ of an inch. In order to jump a gap, the electrical equivalent of pressure has to be pent up in the coil until it acquires sufficient intensity to leap across the air-gap. If there should happen to be a weak place somewhere in the insulation there would be a strong possibility of the current puncturing the insulation instead of leaping across the gap, thus making a short-circuit in the winding of the secondary.

The only reason the current jumps the gap is because it is easier than to pass through the insulation. If puncturing the insulation should be easier than jumping the gap, the insulation will be punctured. Of course, the insulation can be made proof against puncture in case of abuse, but this necessitates bulkier and heavier construction, to say nothing of the added expense, and none of these things are exactly desirable. Therefore the test spark should be kept down to the length mentioned. If the temptation to "stretch" the spark should be yielded to, and the spark should suddenly refuse to jump more than a small fraction of an inch, it can be concluded at once that the hot little blue streak has pricked its way through the insulation, and the proper place for the coil is the place where it was made, for it certainly will need expert attention. The quality of the spark should be judged by its snappiness and fatness, which are of importance in ignition, rather than by length, which is of secondary importance only.

MOTOR TRUCKS FROM CONTRACTORS' VIEWPOINTS

Why Contractors Are Conservative in Motor Trucking Matters—Radical Changes That Upset Men and Methods—Parts of Second-Hand Electric Truck Used to Build New Machine to Fit in With Contractor's Conditions—Ruggedness Required, Not Speed.

New York is a city of enormous building activities. New structures are constantly going up and old ones coming down; subways, tunnels and other excavations follow each other in rapid succession, and there is always "something doing," in the vernacular. Obviously a great many contracting firms are kept busy by this incessant round of construction work, and equally obviously an enormous number of horses and heavy trucks are required to transport the veritable mountains of brick, tile, terra cotta and concrete, as well as structural steel, timber and the thousand and one different kinds of building material that go into skyscrapers and subways.

Contractors Hesitate to Take Up Motors.

It is not to be wondered, therefore, that manufacturers of commercial vehicles, particularly of the heavier types, long have had their eyes and their hopes on the army of contractors who do New York's building up and tearing down, for it would seem that in such work the self-propelled truck would be at its best. Strange to say, however, there appears to be a reluctance on the part of contractors to give up horses in favor of mechanical power, even while they acknowledged the possibilities of the newer form of transportation. Not that there are no contractors using motor trucks; on the contrary, there are quite a number. They are so few, however, as compared with the total, and they seem so much more reluctant than other classes of business to take up the motor that there is reason for some little surprise.

Old Methods Are Deeply Rooted.

The contractors themselves are very reticent as to the reasons for their unwillingness to part with horseflesh. It is more than probable, however, that the great difference that exists between the time-honored horse truck and the machine is a factor of no little weight in causing the contractor to hestitate. For one thing, each contractor usually has a large force of trained men who are the heart and soul of his success; these men aer highly skilled in carrying out their work with horses and the established types of equipment. Changing over to motor trucks means not only considerable trouble and inconvenience to start with, but, what is more, there is strong, unthinking prejudice on the part of the men against the abandonment of the animals with which they have become so familiar, either through fear of "losing their jobs" or, if not that, the belief that they cannot learn to handle the machines successfully. Even the superintendents, who are far from being worried by such considerations, hold back and cast admiring and appreciative glances at their powerful, "chunky" horses.

Believes Horses Belong in the Pastures.

There is one superintendent, however, who has but to shut his eyes for a moment to see a procession of horses wending their way to green pastures—and that at no very distant time. But Superintendent Johnston of the Clarence L. Smith Co., New York, believes the motor truck should be more like the existing types of contractors' vehicles. If this is not possible, it is unquestionable that horses must go anyway; but if motor trucks can be built which will embody the main features of present horse trucks, and so avoid the numerous strange and unfamiliar conditions that are brought about by the installation of motor trucks of the conventional types, it is Johnston's belief that horses will be dispensed with much earlier.

"But do you think it is possible to build trucks that will be much like horse trucks and still give good service?" he was asked.

Motor Truck That Is Like Horse Trucks.

"Do I think so? Why, just wait till I tell you something. We have had motor trucks on our work, and a good many different kinds at that. But they're motor trucks all over, from one end to the other. There's machinery in front and machinery in the rear and machinery in the middle, and it's all very, very different from what the men are used to. We can't treat them the way we would treat a horse truck; it doesn't do to leave it outdoors all the time, and the stable is pretty well filled already. Somehow the regular motor trucks don't appeal to the men as being 'real trucks'—that's exactly the way they express it. I don't mean to say that they are not real trucks, for they certainly are—some of them anyway; but when a driver sees one of his familiar vehicles with a good team hauling a good load he will say admiringly, 'Now there's a real truck!' I never heard a driver say that about a motor truck, except—well, wait till I tell you.

"Some time ago we thought we would do some experimenting on our own hook, and we bought a second-hand Couple-Gear battery truck—one that had been in hard service for many years and was considered pretty well worn out. It had four-wheel drive and four-wheel steer. We sent the wheels to the factory and had them put in first class shape, and the electric motors inside the wheels thoroughly overhauled. Then we went to work and built an ordinary truck of the kind we use for hauling heavy stone and the like, only we made it a little extra heavy. The rear wheels are 4 feet 8 inches in diameter, and the rear axle is 3½ inches square; it's strong enough to carry ten tons. In the front we put a pair of the Couple-Gear wheels with their axle and steering gear, mounted the controller and steering wheel in front of the seat and put a box for the battery under the platform. The platform is 17 feet long and 5 feet 2 inches wide."

Slow Speed But Big Carrying Capacity.

"How does she work out?"

"Fine," replied Johnston. "Fine. Just wait till you see her. Why, man dear," he continued, warming up, "she's a real truck!" and the superintendent remembered and smiled. "But here's the queer part of it. The truck was originally bought by the people we got her from to carry five tons, driving through all four wheels. We use only two of the same wheels, but we carry six tons as a regular load, and she does it easily. The only difference is in the speed. The old four-wheel drive truck ran about 7½ miles an hour light and 5½ to 6 miles an hour with a five-ton load. Our truck, with two driving wheels, runs 6 miles an hour light and 4 miles an hour with a 6-ton load. That's exactly the speed we want. It suits us down to the ground.

Economical and Easy to Handle.

"Now, you see we have a truck with all the machinery—what there is of it—at the front end. The rear end is all just common truck construction. The men work it

Digitized by Google

exactly as they would a horse truck; the platform is braced with big heavy timbers, and they can't hurt anything, though I happen to know that at first they put on as much as 8½ tons, and got away with it. We never think of putting it inside; it stays out in the yard, no matter what the weather is, and it is charged at night through an extension cable. There's a Sangamo ampere-hour meter with an automatic cut-off, so that the current will be thrown off when the battery is fully charged. The machine is twice as easy to handle as a horse truck, and it does at least double the work of the best team we have in the place—and you'll go a long way before you see better horses."

Day and a Half on One Charge.

"How about current consumption? Do you have to 'boost' the battery at noon?"

"Boost? Not much! We don't even charge every night. The battery is a 44-cell 27-plate Philadelphia, with thin plates, and has a capacity of 351 ampere-hours. If the machine is doing light work there's current enough for two days' running, and there's enough for about a day and a half of real hard work. She'll be in in a few minutes now, and you can read the meter for yourself."

Later, when the machine came in from its day's work, the driver said that the work had been rather light, owing to delays in getting loads. The ampere-hour meter showed that but 150 amperes had been consumed, leaving 250 amperes available; therefore no charge was put in. One of the reasons for the current economy of the machine is that the battery is of such large capacity that the average discharge rate is very much below the normal rate of the battery, which of course is conducive to long life and economy. The front drive and steer, in which the wheels always exert power in the direction in which they are moving, is also an important factor, while the Couple-Gear motor wheels are remarkably efficient both electrically and mechanically.

Electricity the Coming Power.

"I have an idea," said Johnston, after the truck had been inspected, "that some of these days everything in our line will be done by electricity. There is something in electric power that appeals to contractors. It's not all imagination, either. Wait till I tell you. Not long ago we finished a contract at Madison avenue and 43d street, where it was desirable to make as little noise and dirt as possible, and what do you think we did? Why, we used electricity for everything. The rock was drilled with four electric rock drills, it was hoisted out of the excavation with an electric derrick and it was hauled away by an electric truck —this one right here. And let me tell you, you never saw a job done better or more cleanly and quietly."

New Truck on Old Wheels.

The Clarence L. Smith Co. still has the remaining pair of wheels from the old truck that was purchased, and these will be utilized in the construction of another front-wheel drive six-ton machine. As was the case with the first machine, all the work will be done in the Smith shops, which are equal to the task of turning out any work that is likely to be called for in contracting work, and a good deal that is not.

A number of trucks of the same general type have been built by the Couple-Gear Co. for service in Boston. InIcidentally, the company has evolved a new and decidedly ingenious name for the machine. The front part, they argue, is an automobile and the rear part is a plain wagon. Therefore, the front part of the word automobile is combined with the rear part, so to speak, of the word wagon, making the new name —Autogon.

Split-pin is Brought Up to Date.

As a means for preventing a nut from backing off a bolt it is a difficult matter to beat the good old-fashioned split-pin which, put into the hole and slightly spread, can be relied upon to stay. It has a drawback, however, in that its extraction sometimes is extremely difficult, especially if the ends are spread wide apart, as they too frequently are. Every chauffeur and repair man and most dealers know this, to their sorrow, for it is no joke to cut a split-pin to bits in an inaccessible place.

But by making a little bend in one place and taking out a curve from somewhere else, the old split-pin has been transformed to a new one and the drawback removed. The result is the Campbell pin, shown in the accompanying illustration, made by A. C. Campbell, of Waterbury, Conn. As the picture shows, the loop at the end of the pin is all on one side and one of the points is slightly longer than the other, and is bent over the shorter end. When the pin is in place a slight blow on the head of the pin drives the short end against the upturned longer end, spreading the pin just to the right extent, which is a decided improvement over wiggling a screw-driver between two tightly-closed parallel points. And when the pin is to be removed a pull with the tang of a file or the like inserted in the loop starts the short end first, allowing the bent end to slip out easily. All the work is done from the head, so there is no need to hestitate before inserting a pin where the point is difficult to reach—

CAMPBELL SPLIT PIN

in other words, in such a place that the insertion of the pin is accompanied by a fervent hope that the necessity for its removal never will arise.

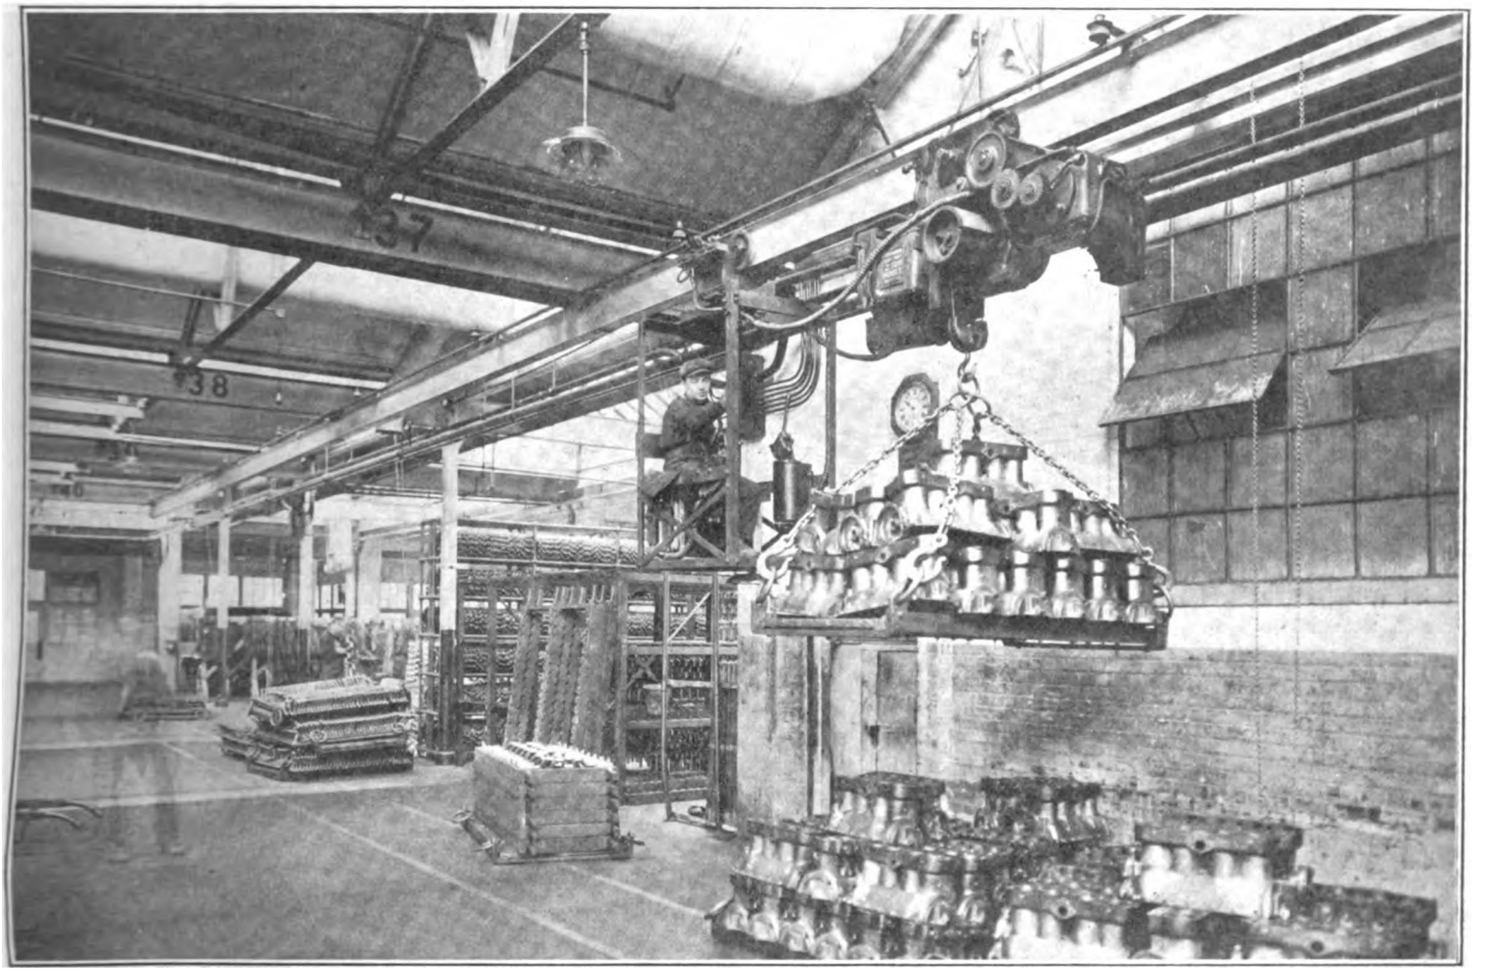
Truss-rods; Their Purpose and Abuse.

The purpose of a truss-rod, whether it be under an axle, under a frame, or anywhere else, is not to carry the whole load or even the greater part of it, but to stiffen the member to which it is attached. Therefore the turnbuckles or other adjustments on truss-rods should not be set up too tightly, lest the strain be more than the rod can withstand.

Misfiring as Cause of Motor Wear.

While it is decidedly unpleasant to run a motor with any of its cylinders missing, it is really worse than unpleasant, for the lack of balance and the consequent vibration are apt to cause a good deal of extra wear and tear and strain.

Dealers Show in a Tented Forest.



Lacking a more suitable structure, the Sacramento (Cal.) Automobile Dealers' Association conducted its annual automobile show, which was run in conjunction with the California State Fair during the week of September 15-22, in a huge tent erected on the fair grounds. The temporary nature of the structure, however, in no wise limited the attractiveness of the show; decorations there were in plenty, which took the form of a native pine forest, the trees and tree stumps serving to separate the booths of the 12 motor car exhibitors who staged 24 different makes of pleasure and commercial vehicles. Among the exhibitors were: W. N. Hunt, Stevens-Duryea, Cole, Woods electric; Baker & Harder, Velie; Sacramento Motor Sales Co., Winton, Henderson; Graham & Lamos, Peerless, Everitt (Flanders), Baker electric; Oakland Motor Sales Co., Oakland; H. H. Whetstone, Haynes; Studebaker Corporation, Studebaker; George W. Whipple, Marion; Arnold Bros., Hudson; Luttig & Cox, Detroiter; A. Meister & Sons, Kissel, National, Stoddard-Dayton; J. D. Laupe, Buick, Jackson, Federal truck.

When a valve chamber cap of the recessed type is stuck, it usually can be started if, when hot, cold water is poured into the recess, contracting the metal.

OVERHEAD SYSTEM THAT REDUCES FACTORY COSTS

Traveling Crane Employed in Ford Factory That Carries Heavy Loads With Surprising Swiftness, Lessening Labor and Increasing Efficiency—Bridges Gap Between Machine Shop and Storeroom One of the Developments of Scientific Factory Operation.

MODERN FACTORY TRANSPORTATION METHODS—ONE OF THE OVERHEAD ELECTRIC CRANES IN THE FORD PLANT

To obtain true efficiency requires the application of scientific management in its broadest sense, and in these respects, the shops of the Ford Motor Co., in Detroit, Mich., furnish food for many sermons. In the fewest possible words, the methods of the company comprehend all that is necessary to a quick, efficient and economical result. The immense production which is carried on and the still greater production which is scheduled require that such be the case. Labor-saving devices and machinery which permits of quick and sure handling of finished parts both are absolutely essential, and it goes without saying that in the equipment of his immense shops Henry Ford has not been blind to such considerations.

Without doubt, one of the most interesting of the many ways in which work is expedited is to be found in the system of overhead craneways which form a network over the buzzing and humming automatic machinery in some parts of the shops. Automatic machinery, it should be interpolated, is not human; it takes no count of human ability or endurance; it goes right on turning out finished parts just as fast as the raw material is fed into its rapacious maws. But it requires human ingenuity to devise methods whereby the finished parts can be carted away from the machines so that efficiency, the fetish of the modern shop, can be maintained. It is one of the duties of the overhead crane to bridge the gap between the machine and the storehouse or the assembly room, and bridge it it does and in remarkably short time.

In one of the shops in the Ford works—the floor area best can be expressed in acres—there is one of these overhead cranes, and its capacity for work is phenomenal. It runs on a single overhead track—or, rather, it hangs from the track, and it does not run at all; it seems to fly. If it does not average 20 miles an hour from one end of the shop to the other with its load of two tons and the operator banging away at a gong for all the world like the spirit of a trolley car motorman on high, it most assuredly appears to do so. The operator sits in a tiny coop that is just large enough for him to work his elbows. At one hand there is the lever which controls the current to the traversing motor; another lever, for the other hand, controls the elevating gear.

In operation, a miniature flatcar loaded high with cylinder castings, for instance, is shot beneath the overhead track. Almost

Digitized by Google

immediately the operator spots it with his eagle eye, and mid a clanging of the gong and a rumbling of the gearing, the little hanging monorail car swoops down on the unoffending flatcar. It is the work of but a moment to attach a chain from the hoist to four other chains which are fastened to the corners of the top of the flatcar. A simple twist of the operator's wrist and the whole top of the flatcar, load and all, slowly but surely is hoisted clear of the busy machinery. Another twist of the wrist and the two-ton load is conveyed at almost incredible speed clear to the other end of the shop and deposited on the freight elevator, the ultimate destination being the storerooms on an upper floor. Returning, the crane picks up five or six flatcar tops all at once and drops them off one at a time wherever they are most needed. There is no lost time; the crane moves eight or ten times as much at one time as could be moved by any other method and at three times the speed.

FACTORY SHORTCOMINGS UNCOVERED BY ENGINEER'S INSPECTION

Employed to "Look Into" an Engine at the End of the "Running In" Period, He Points Out Minor Faults That Had Developed, Many of Them Due to Lapses in the Factory—Correctives Which He Recommended to Remedy the Derangements.

It is a favorite theory of those who have to do with the construction and operation of motor cars, that no car, brand new, delivers itself of the best that is in it. Generally, it requires from two to eight weeks of more or less constant work before the parts are sufficiently "run in" to insure absolutely proper functioning. In the hands of the average user, if the motor is looked over at all at the end of that time, only the faults which are so pronounced as to be obvious to the novice are corrected; generally all that is done in the way of adjustment, is a general tightening of bolts and set screws. Just what faults may develop during the "running in" period, however, are shown by the case of a medium priced car which was taken down after a month's usage and gone over with a fine tooth comb, so to speak, by an engineer whose ability to do that sort of thing was abundantly proven years ago. His expert criticism and discoveries point the way to betterment in more than one factory.

Scored Cylinders and the Cause.

When the cylinders were removed—it was a six-cylinder car—it was noticed that three of them were quite badly scored and cut; they evidently had seized the cylinder walls, which had caused the abrasion. The trouble was caused by the pistons themselves, which, in the first place had warped oval, and, in the second place, had been ground to too tight a fit. The warping was the effect of non-annealing the pistons after the finishing cut had been taken. Naturally, the correction lay in the insertion of new pistons; the cylinder walls, strange though it may seem, were not scored at all.

Camshaft Bearings Wrongly Adjusted.

All of the camshaft bearings were in bad shape. All three had been fitted too tightly, with the very natural result that the shaft seized and cut up the bearings as well as the shaft itself. Of course the shaft had to be turned down slightly and the bearings bushed. The crankshaft bearings had been fitted perfectly, radially, and the running in process had left them in first class condition. In fitting, however, insufficient allowance had been made for the longitudinal expansion of the shaft with the result that the shaft was slightly scored at the inside ends of the bearings. A very slight amount of the bearing metal was turned off to allow for the expansion, and the shaft was turned slightly to rid it of the rough places. All of the crank pin bearings were in first class condition, as were the wrist pins and wrist pin bearings.

The piston rings were in good condition, but, owing to the fact that they had not been pinned, the slots had worked around so that they were not in the best position for the retention of compression.

Derangements in Valve Mechanism.

One of the valve lifters—it evidently had been made from steel which was not homogeneous in structure and contained a soft spot—had worn hollow at one point, which not only made the valve mechanism noisy, but seriously affected the timing of the valve. Naturally the lifter had to be replaced.

The caps which served to cover the inlet valves had been made just a trifle longer than was necessary, and the heat had deformed the threads which protruded into the compression chamber. The result was that the caps were hard to remove, and when they did come out the threads in the cylinder were slightly marred. Moreover, the sharp edges of the threads which were exposed to the heat of the burning gases had become heated and caused premature ignition and sluggish running.

The inlet valves were in first class shape, which is not surprising in that they are cooled by the entering mixture. The exhaust valves, however, were badly burned and pitted, their poor condition being attributed to the fact that the car was run for quite a time with a carburetter which supplied too rich a mixture. This naturally caused the valves to become overheated, and burning ensued. The carburetter originally supplied was faulty in that the opening in the jet was too large.

With the exception of the pitted valve lift, which gave audible evidence of a fault that needed correction, not one of these faults could be detected unless the motor were taken down. Had the owner simply confined his efforts to tightening up the various bolts and nuts which enter into the make up of the car, however, it is not at all unlikely that before the machine had been operated for a period equal to the "running in" period more serious trouble would have developed.

Valve Lifts as Causes of Trouble.

A prolific cause of motor vibration and unsteady running is unequal valve lift, due to wear of the valve stem ends or the tappets, or to need for adjustment. If one tappet has a clearance of, say, a sixteenth of an inch below the valve stem and another has only the normal thickness of a card, it is clear that the former will open its valve the latest, for the tappet has further to go before it begins to lift the valve; moreover, the closing will be earlier. This is decidedly detrimental to smooth running and the development of full power, and very often a marked improvement can be made by going over the valve lifters carefully and making sure that they all have the same clearance, and neither too much nor too little.

How Grit May Get Into Bearings.

Ordinarily a grease gum is not particularly well protected from dust and dirt, doubtless for the reason that the interior seems quite well protected anyway. It is by no means impossible, however, for grit and dirt to get into the spout and so into the first bearing that the gun happens to be used on.

ALCO TRUCK DELIVERS THAT LOAD OF SOAP

Reaches California After a Rigorous Trip of 4,070 Miles—Its Record Preserved in Unusual Detail —Conditions Encountered.

They've delivered that soap at Petaluma. It got there on Friday last, 20th inst., after a 596-hour journey straight across the continent on an Alco truck, and the trip demonstrated, among other things, that the driver of a transcontinental truck must be a road engineer and a bridge builder, at least, to say nothing of several other minor accomplishments which he must have at his finger's ends, so to speak. No transcontinental journey in a road vehicle can be expected to be child's play. Even tourists on pleasure bent have found out otherwise. But when a heavy motor truck, heavily laden in the bargain, essays such a passage it is enough to expect that it will reach its destination. Though the Alco truck did not have a particularly hard time of it, neither did its crew have a particularly easy time.

On the afternoon of June 20th, after having headed a mammoth commercial vehicle parade in Philadelphia, the truck started on its transcontinental trip laden with three tons of soap consigned by Charles W. Young & Co., of Philadelphia, to a silk mill in the California city. Fifty-six days later the 4,070 miles between New York, which was the first stop, and San Francisco had been covered and the load of soap was delivered. In the meantime, however, the crew had been beset by many evils, chief among which were the almost impassable roads and the absence of bridges that would support the weight of the truck without bracing and other skillful attention from the crew.

It was between Cleveland and Toledo that the crew had its first experience of bad roads. New highway construction forced the truck over trails of its own through long stretches of sand and mud with scarcely a bit of good road until Chicago was reached. Later, in crossing Western Illinois many miles of gumbo roads had to be negotiated, and rain had made bad conditions even worse. In Iowa, the roads were even worse, and at times they became absolutely impassable. Added to which the heat was excessive, the thermometer registering as high as 100 degrees. It was in Iowa that the crew had its worst experience with weak bridges. Time and again it became necessary to strengthen planking, to brace shaky structures with boxes of soap and to support washed out header beams with the powerful hydraulic jacks and other tackle that formed part of the equipment. In all, some 500 bridges were crossed in the journey across the State, and no less than 100 of them required some kind of treatment to render them safe. In Wyoming, conditions were worse, if that was possible. In eight days there were no less than 10 cloudbursts and the already execrable "roads" were turned into veritable morasses. Steep sided gullies were numerous, and frequently it was necessary to leave the road and blaze the way.

By the way of ensuring an accurate record of the mileage and time on the road, the recording apparatus was more than ordinarily complete. For instance, there was a Sear-Cross speed and mileage recorder, a Servis time recorder, a Coronet hub odometer, and a Veeder odometer. In addition, the truck was equipped with an aneroid barometer, a gradometer, a thermometer, and a compass. According to the daily log which was kept, the total time the truck was on the road was 595 hours 36 minutes, of which 302 hours and 20 minutes, or approximately 51 per cent., represents the time the vehicle actually was under weigh. The remainder of the time was spent in reconstructing roads, digging the truck out of the mud and sand and lending a helping hand to indigent bridges. According to the Servis instrument, the average time on the road each day was 10 hours 29 minutes; the average time in motion, 5 hours 21 minutes. In a single day—the day in which the greatest number of stops were made for road constructing, etc.—the crew was compelled to get down and work no less than 100 times, the unfortunate roads which caused the work being those in Iowa. Altogether some 1,305 stops were made in the 56 days, which figures out at an average of 25 a day.

Despite the strenuous going, however, the truck pulled into San Francisco little the worse for wear, and immediately will be shipped back to Philadelphia, where it will be put back into service.

Start of A. A. A. Tour Postponed.

Owing to the fact that to date but fifteen entries have been received for the coming A. A. A. National Reliability tour from Detroit to New Orleans, which originally was due to leave the automobile capital on October 7th, it has been deemed the better part of wisdom to postpone the start of the event one week, or until Monday, October 14th. In the meantime efforts are being made to "clinch" matters with several manufacturers and cities that have half promised to enter teams, and to this end W. J. Morgan has been sent to Detroit and J. M. Memstreet to New Orleans.

RAIN HURTS AND HELPS MILWAUKEE RACES

Causes Another Postponement, Which Arouses Civic Pride and Opens Purses—Vanderbilt to Start Program October 2.

Whether or no the several days' downpour which necessitated the abandonment of the plan of the Milwaukee Automobile Dealers' Association to conduct the contests for the Pabst and Wisconsin trophies of Friday last, 20th inst., and for the Vanderbilt Cup on Saturday, 21st, was a blessing in disguise, is an open question. Certain it is, that though several thousand spectators who had assembled at the course on Saturday morning last to witness the most interesting event which is included in the program, were greatly disappointed, the postponement paved the way for the making of even more interesting contests, for through its agency both time and money, both necessary to put the course in proper condition, have been forthcoming.

A combination of civic bodies, unwilling to see the first national events which Milwaukee has attempted to father, degenerate into a "fizzle," has allied itself with the dealers association and pledged the funds necessary to keep the force of 300 laborers who, under the county highway commissioner, are putting the finishing touches on the course at work until the Vanderbilt race is called on Wednesday, October 2d. The revised schedule calls for the running of the remainder of the program, the contests for the Pabst and Wisconsin trophies on Thursday, October 3d, and the Grand Prize on Saturday, October 5th.

By way of retaining the entrants, the dealers' association has agreed to "foot the bills" accruing during the two weeks interval. Although the postponement of the speed carnival opens the way for late entries, it is doubtful if any newcomer will be recruited to the ranks. The entries are as follows:

For Vanderbilt Cup—Charles Merz, Stutz; Gil Anderson, Stutz; Ralph DePalma, Mercedes; Spencer Wishart, Mercer; George Clark, Mercedes; Ralph Mulford, Knox; Hughie Hughes, Mercer; Theodore Tetzlaff, Fiat; Harry Nelson, Lozier; N. Pullen, Mercer.

For Grand Prize—Hughie Hughes, Mercer; Ralph DePalma, Mercedes; Theodore Tetzlaff, Fiat; David Bruce-Brown, Fiat; Caleb Bragg, Fiat; Erwin Bergdoll, Benz; Robert Burman, Benz; George Clark, Mercedes; Joe Horan, Benz; Spencer Wishart, Mercer; Harry Nelson, Lozier.

Digitized by Google

For Pabst Trophy—Hughie Hughes, Mercer; Neil Pullen, Mercer; Spencer Wishart, Mercer; G. Trussell, Fal; H. Hastings, Fal; Mort Roberts, Mason; Joe Nikrent, Case.

For Wisconsin Trophy—H. Herber, Studebaker; Harry Endicott, Mason; Kramer, Mason; Snyder, Mason; Kulik, Ford.

Kyle Stars at Providence Meet.

Not content with receiving only the "small change" with regard to the cash prizes offered, and but a beggar's portion of the glory attaching to the contests, Harry Kyle, Joe Grennon, Henri Hickman and the Cuban, Louis Menenghetti, erstwhile drivers in the E. A. Moross troupe, have struck out for themselves under the management of E. W. Powell. They made their debut Saturday last, September 21st, in the Narragansett Park half-mile track at Providence, R. I., and Kyle played the star part by taking three of the seven events which were run. His victories included a three-mile event for cars with displacements of under 300 inches, in which he drove a Mercer and won in 4:12, a five-mile event for cars with displacements of under 450 inches, which he completed driving the White, in 8:14⅕, and a single mile time trial which he drove in the White in 1:18.

Grennon (Mercer) and Menenghetti (Pope-Hartford) split honors in the remaining events of the program, Grennon taking the handicap and a match race, and the Cuban took the events which were left. The summary:

Three miles, for cars with displacements of under 300 inches—Won by Harry Kyle (Mercer); second, Louis Menenghetti (Pope-Hartford). Time, 4:12.

Five miles, for cars with displacements of under 450 inches—Won by Harry Kyle (White); second, Henri Hickman (Mercedes). Time, 8:14⅕

Three miles, match race—Won by Joe Grennon (Mercer); second, George Cook (Zust). Time, 4:18⅕.

One-half mile, for cars with displacements of 300-450 inches—Won by Louis Menenghetti (Pope-Hartford); second, Joe Grennon (Mercer); third, Henri Hickman (Mercedes). Time, 0:45⅖.

Five miles, for cars with displacements of under 600 inches—Won by Louis Menenghetti (Pope-Hartford); second, Joe Grennon (Mercer); third, Harry Kyle (White). Time, 5:02.

Five miles, free-for-all handicap—Won by Joe Grennon (Mercer); second, Harry Kyle (White); third, Louis Menenghetti (Pope-Hartford). Time, 5:09.

One mile, time trial—Harry Kyle (White). Time, 1:18.

Light Regulator for Ford Cars.

If there is one branch of the motor car industry which, more than another, is wide awake to every opportunity to make motoring an unalloyed pleasure, it is the accessody manufacturing branch, which turns out the thousand and one little conveniences that often are of such utility as to be almost necessities, and some of which sooner or later achieve the distinction of becoming "standard equipment." Every opportunity is seized to make something work a little better, or to make something easier to do, or to make two functions grow where only one grew before, so to speak. A recently developed device of this class is the J. & B. light regulator for Ford cars, and is the product of the J. & B. Mfg. Co., of Pittsfield, Mass., which succeeded the Jacobson & Brandow Co. The object

J. & B. LIGHT REGULATOR

of the regulator is to keep a steady, practically unvarying current flowing to the head lamps, regardless of fluctuations due to varying speeds of the magneto, and in this way keeping the lamps burning steadily and prolonging their useful lives.

The regulator has no moving parts, and consists of two coils of wire mounted on an iron base; there is a terminal on the base for the single wire that conducts the current from the magneto, and two terminals on each coil for the wires leading to the lamps, which are grounded on the other side. By this arrangement the lamps are wired in parallel—that is to say, each is fed directly from the source of current, in contradistinction to series wiring in which the current passes through each lamp in turn, the lamps forming a chain. If wired in series, the breakage of the filament of one lamp interrupts the current and extinguishes all the lamps on the circuit, while if wired in parallel only the broken lamp is affected.

The Ford magneto generates sufficient current to light the lamps to their normal brightness when the car is running about eight miles an hour on high gear. From this speed up to the maximum of which the motor is capable the variation in the voltage of the lamp current is not more than 5 per cent., according to the makers of the regulator.

Cincinnati "Sociability" On Large Scale.

If the number of participants in the "sociability run," conducted on Saturday last, 21st inst., by the Cincinnati Commercial Tribune was a measure, it was a truly sociable affair beyond all shadows of doubt. No less than 175 started, of which number 125 finished the 104-mile run from Cincinnati to Dayton and return. Gasolene cars comprised one class; electrics, with three vehicles in line, the other. Twenty-one prizes in all were offered for the participants who came nearest the average running time of all the participants, which figured at 6 hours and 14 minutes. There also were three prizes for the best decorated cars. Of those who competed in gasolene driven cars, the three best averages were made by J. D. Bruner (National), Clifford Walker (Oakland), W. C. Everhardt (Studebaker 20). Only one of the electrics, an Ohio, finished; it was driven by Miss Helen Schmidt. The other two electrics were disqualified, as were the greater part of the gasolene cars which did not figure as survivors, for failing to come within the maximum running time of 10 hours. The average for the electrics was two hours and 15 minutes slower than for the "gas" class.

Westgard Again Crosses the Continent.

Having twice crossed the continent since he left New York on June 11th last, to map out three transcontinental routes, A. L. Westgard, official pathfinder of the A. A. A., arrived in New York Tuesday last, 24th inst. To date Westgard has mapped out two of the routes, the first known as the Northern Trail, leading from New York to Seattle, Wash., and the second, the Overland Trail, from San Francisco to New York. The third route which Westgard will set out to cover in his Pathfinder car, within a few days, leads from New York to Los Angeles, and will be known as the Midland Trail. Roughly, Westgard has completed 10,000 miles in 105 days, which averages slightly better than 95 miles a day.

To Prevent Turning of Wood Screws.

In rare instances, it is found necessary or advisable to lock wood screws to prevent their backing out. Probably the simpler mode of procedure and one which is certain of accomplishing the purpose, is to drill a hole at an angle through the head of the screw. When the screw has been correctly positioned, a brad should be inserted in the hole and, as it enters the wood at the shank of the screw, the latter is prevented from turning.

MOROSS'S NEW TALENT RACES AT PITTSBURGH

Although Short Four of His Former Performers, He Successfully Stages Seven-Event Meet—Poor Day for Burman.

Having filled the breaches caused by the defection of Joe Grennon, Harry Kyle and Henri Hickman, who have set up their own "establishment", E. A. Moross promoted a seven-event meet on the Brunots Island track, Pittsburgh, Pa., Saturday last, September 21st, at which his new "talent" was introduced. The affair, however, fell short of the Moross standard in that although Bob Burman was entered in five of the contests, he won but two—the three-mile event for the Remy Brassard and trophy, in which he completed the two heats, driving the Blitzen Benz, in 2:59.85 and 3:09.95, respectively, and the single mile time trial which he completed, likewise in the Benz, in 51.98 seconds, thereby lowering the local track record of 52.80 seconds, made by Oldfield two years ago.

Of the other five events which were included in the program, John Minker (Kline) took both the five-mile event for cars with displacements of under 300 inches, which he completed in 4:58.06, leading home Raimey (Ohio) and Harvey Ringler (Mercer), and a race for cars with displacements of under 600 inches, in which he completed the five miles in 4:52.92. J. D. Kerr (Kline) also gathered the two events for cars with displacements of under 450 inches, in which he completed the five miles in 5:34.65, and a three-mile free-for-all handicap, which he completed in 3:08.80.

No little excitement was stirred up during the Class E event, for cars with displacements of under 600 inches, when Joe Horan (Cutting), who had been trailing behind Minker (Kline) and Burman (Ohio), was blinded by the dust kicked up by the leading cars, and went through the fence on one of the turns. The car rolled over the embankment and turned several somersaults before it finally brought up against a boulder. Horan, who completed the evolutions with the car, was unhurt save for a few minor bruises, but the car was put of running condition for some time to come. The summary:

Five miles, for cars with displacements of under 300 inches—Won by John Raimey (Ohio); second, J. D. Kerr (Kline); third, Harvey Ringler (Mercer). Time, 5:02.82.

Five miles, for cars with displacements of 231-450 inches—Won by John Minker (Kline); second, John Raimey (Ohio); third, Ringler (Mercer). Time, 4:58.06.

Five miles, for cars with displacements of under 600 inches—Won by John Minker (Kline); second, Robert Burman (Ohio); third, Joe Horan (Cutting); out after accident. Time, 4:52.92.

Three miles, for the Remy Brassard and trophy. First heat—Won by Robert Burman (Benz); second, Fetterman (Simplex); third, Harvey Ringler (Mercer). Time, 2:59.85. Second heat—Won by Robert Burman (Benz); second, Fetterman (Simplex); third, Harvey Ringler (Mercer). Time, 3:09.95.

One mile, time trial—Robert Burman (Benz). Time, 51.98.

Five miles, for cars with displacements of under 450 inches—Won by J. D. Kerr (Kline); second, Robert Burman (Ohio); third, J. E. Schaefer (Mercer). Time, 5:34.65.

Three miles, free-for-all—Won by J. D. Kerr (Kline); second, J. E. Schaefer (Mercer); third, John Minker (Kline). Time, 3:08.80.

Minnesota County Has No Motor Cars.

For some time various counties, villages, cities and localities have been claiming large numbers of automobile owners in proportion to population, but Cook county, Minnesota, comes forward with a claim which really places it in a class by itself; it has learned from registration statistics that it owns no cars at all. The State of Minnesota has 21,218, and they are valued at $6,460,220.

Downpour Causes Postponement in Detroit.

Rain, which made the use of the State Fair track impossible, necessitated the postponement of the race meet which was to have been run at Detroit Sunday last, 22d inst., in conjunction with the Michigan State Fair. Although the new dates for the meet have not as yet been announced, it is not at all unlikely that the meet will be held Sunday next, 28th inst.

Sixty-five Cars in the Canal Zone.

The Canal Zone, which is the name applied to that territory contiguous to the Panama canal, has sixty-five motor cars within its limited confines. Of these, all but fourteen are owned by residents of the Republic of Panama. All but one, a motor truck, are touring vehicles.

At a meeting which resulted in the formation of the Forest City (Ia.) Automobile Club, J. B. Conley was elected president, H. F. Thompson vice-president, Elmer A. Henderson secretary and B. J. Thompson treasurer.

FEES IN FLORIDA ARE DECLARED ILLEGAL

State Law Held To Be Unconstitutional, But by a County Court—Points On Which an Attorney Attacked It.

The Criminal Court of Duval county, Florida, has declared the State tax on automobiles unconstitutional in a case which was brought by the State against John E. Hartridge, an attorney.

The question which was brought up is one that has recurred in many other states, and though in nearly every instance registration fees have been declared constitutional, the Florida court took the opposite view. For this reason the case is interesting, but the decision will lack force until it has been passed upon by a higher tribunal. In defending the action, Hartridge contended that the fee required for registration is a tax and not a license, and that, therefore, "chapter 6212 of the laws of Florida, relating to the operation of automobiles on public highways by owners, not for hire, is unconstitutional and void." In fighting against what he styled "double taxation," Hartridge set forth that:

"(a) It is a tax and not a license, and is unauthorized by the constitution.

"(b) It is a double taxation, automobiles being subject to ad valorem taxation aside from the tax sought to be imposed under this act.

"(c) There is no provision for any regulation in the statutes.

"(d) It violates section 16, article III, of the constitution in relation to its title.

The title of the act is to license automobiles and other motor vehicles using the public roads and highways.

"(e) It is unconstitutional because it provides for the tax collector to issue the license, which is a violation of article V, section 1, of the constitution.

"(f) It is an act of revenue and not of regulation."

Dawson Restored to Good Standing.

Joe Dawson, who won the Indianapolis Sweepstakes race at Indianapolis on Memorial Day, and C. E. Shuart, his former manager, have been restored to the "good list" by the contest board of the A. A. A. Dawson's timely reinstatement, coupled with the postponement of the Milwaukee road races, opens the way for him to appear in those events, but whether or no he will do so is a matter which has not yet been decided.

1,016,522. Starting Device for Explosive Engines. Frank Reynolds, Syracuse, N. Y. Filed Nov. 9, 1904. Serial No. 231,971. (Cl. 123—180.)

1. In an engine of the class described, the combination with the cylinder, piston and igniter, of a manually controlled starting-device comprising a reservoir for storing explosive mixture under pressure and connected to the cylinder, a normally closed valve operative for admitting the explosive mixture into the cylinder, a mechanism for moving the piston to a predetermined position and including means adapted to throw said mechanism out of connection with the engine to allow the piston to remain at rest in said position, means for opening said valve at will while the piston is at rest, and means controlled by the piston moving mechanism for effecting the ignition of the admitted mixture as set forth.

1,016,543. Governor for Gas or Other Engines. John F. Bridges, Alameda, Cal. Filed Dec. 3, 1907, Serial No. 404,906. Renewed Aug. 24, 1911. Serial No. 645,722. (Cl. 121—112.)

1. In combination, a shaft, a fly wheel thereon, means for controlling the transference of energy, a driven wheel loose on the shaft and adapted to transmit power to a load, a lever carried by the fly wheel, a weight on the end of said lever a cam finger carried by the driven wheel, and engaging an arm of said lever, a spring arranged to press said cam finger against said arm to oppose the outward movement of the weight due to centrifugal force, and a connection from said lever to said controlling means, whereby the inward or outward movement of said lever correspondingly moves said controlling means, substantially as described.

1,016,558. Pneumatic Attachment for Vehicles Wheels. Herman Garrison, Chicago, Ill. Filed Feb. 13, 1911. Serial No. 608,293. (Cl. 152—28.)

1. An attachment of the character described consisting of a pneumatic tire of the ordinary construction fitted to the rim of the wheel, and an expansible pneumatic mounted on the wheel in communication with said tire and between the hub and rim of the wheel, said pneumatic comprising a pair of spaced apart plates, a flexible construction extending between the respective edges of said plates, and means to press one of said plates toward the other.

1,016,561. Plunger and Cylinder Packing. Peter Grabler, Cleveland, Ohio. Filed June 2, 1909. Serial No. 499,741. (Cl. 121—108.)

In combination, a cylinder, and a plunger having its bearing surface provided with a plurality of transversely isolated pockets.

1,016,631. Attachment for Automobiles. Frederick A. Howard, Chester, Pa. Filed Nov. 18, 1910. Serial No. 593,008. (Cl. 240—62.)

1. In an automobile, the chassis, and steering mechanism, in combination with a lamp bracket having a vertical stem, a bracket on said chassis, said stem being rotatably, mounted in said bracket, an arm on said stem, a rod connecting said steering mechanism and said arm and a link pivotally connected to said chassis and said arm, substantially as described.

1,016,651. Pneumatic Spring. William H. Staats, Colonie, N. Y. Filed April 22, 1910. Serial No. 557,049. (Cl. 21—50.)

1. The combination with a vehicle frame, an axle, and a leaf spring having its ends attached to the frame, of a casing, open at its lower end, mounted on the upper side of the spring and having in opposite side walls slots that extend to the lower edge of such walls and through which the axle passes, a compression plate mounted on the axle within said casing and having depending guides bearing against adjacent walls of the casing, and a pneumatic cushion arranged within the casing between the top thereof and said compression plate.

1,016,673. Vehicle Wheel. William J. Cunningham, Philadelphia, Pa. Filed Dec. 16, 1910. Serial No. 597,632. (Cl. 152—28.)

1. In a device of the character stated, a rim, a channel member carried thereby, a series of spring members seated in and connected with said channel member, the ends of said members interfitting and depressed to form a seat, a tread member, a frame carrying said tread member, a lug on said frame located in said seat, said channel guiding said frame in its movement and serving as a stop therefor, resilient means for connecting said frame and rim and resilient strips connected with said rim and the sides of said frame.

1,016,675. Explosion Motor. Paul Daimler, Cannstatt, Germany, assignor to Daimler Motoren Gessellschaft, Unterturkheim, Germany, a Firm. Filed June 13, 1911. Serial No. 632,881. (Cl. 123—195.)

1. In combination with an explosion motor, a sparking device, a cooling water pump and an oil pump, each arranged at one end of the motor and one above another, and means whereby said sparking device, water-pump and oil-pump may be mutually and directly driven from the motor shaft.

1,016,693. Spring Wheel. Henry C. Keller, Bondville, Ill. Filed Jan. 29, 1910. Serial No. 540,743. (Cl. 152—51.)

1. In a vehicle wheel, a hub, a series of spokes arranged in pairs and secured thereto, a pair of spoke rims to each of which a spoke of each pair is secured at its outer end, a tire rim of diameter larger than the spoke rims, and resilient members pivoted to said tire rim and to the hub, said resilient members being of greater width for a portion of their length than the space between each pair of the aforementioned spokes, whereby the latter constitute elongated abutments to limit the flexure of said resilient members.

1,016,722. Dirigible Lamp for Automobiles. Robert H. Wallace, New Brighton, Pa. Filed July 8, 1911. Serial No. 637,510. (Cl. 240—62.)

1. In a lamp shifting mechanism for automobiles, a pair of brackets abutting against and provided with means extending in the inner face of the side frames of the automobile at the forward ends thereof, each of said brackets including a top plate bearing upon the top of the frame and projecting inwardly from the frame, the inwardly extending portion of said plate having the free terminus thereof formed with a boss constituting a bearing, and shiftable lamp holders carrying shafts extending through said bearings.

1,016,750. Throttle Mechanism for Automobiles. Charles B. King, Detroit, Mich., assignor of one-half to Ora J. Mulford, Detroit, Mich. Filed July 21, 1910. Serial No. 572,955. (Cl. 21—90.)

1. The combination of an engine operating part, a steering post, a part adapted to slide lengthwise upon said steering post, means for adjusting said sliding parts to different positions along said steering post, a pivoted lever resting against said sliding part, and means connecting said engine operating part and lever so that any movement of said lever shall actuate said engine operating part, and a pedal adapted to impart motion to said lever that shall carry it out of contact with said sliding part, substantially as and for the purpose described.

1,016,810. Pneumatic Suspension Device for Vehicles. John Williamson, Brooklyn, N. Y., assignor, by direct and mesne assignments, of one-third to Harvey E. Randall and one-third to Albert P. Stewart, Brooklyn, N. Y. Filed March 31, 1911. Serial No. 618,181. (Cl. 21—50.)

1. In a vehicle, the combination with the axle and frame member, of a casing, an annular resilient member vertically arranged in the casing and engaging the peripheral wall of the casing, a block in the casing engaging the resilient member by its periphery and freely movable in the casing in all directions to compress the resilient member when moved in any direction in said casing, the casing and block having similar peripheral re-entrant portions, the axle and the frame member being connected with the block and the casing, by the block being secured to one of said two members and the casing at its re-entrant portion being secured to the other of said two members.

1,016,838. Steering Mechanism for Motor Vehicles. Don Curtis Luce, Boston, Mass. Filed Nov. 9, 1910. Serial No. 591,510. (Cl. 21—90.)

1. A steering mechanism comprising a hub having a series of bisymmetrical cams and radial arms between said cams, said arms having transverse slots, U-shaped springs engaged with said slots and confined thereby against sidewise displacement, a locking cup surrounding the hub, the cup and the hub cams forming roll-receiving chambers, each of which is wider at its ends than at its center, rolls in the end portions of said chambers in contact with the springs, and pressed simultaneously thereby in opposite directions toward the central portion of the chambers, an unlocking cup having fingers located in the central portions of the chambers, between the rolls therein, and a spindle engaged with the unlocking cup, and adapted to turn in the hub.

1,016,846. Anti-Skidding Attachment for Wheels. Charles H. Myers, Franklin, Pa. Filed March 20, 1911. Serial No. 615,501. (Cl. 152—14.)

1. In an anti-skidding attachment for wheels, a tread-plate, oblique, relatively diverging flanges and transverse flanges upon the outer face of said plate, longitudinal, inwardly-extending flanges at the lateral edges of said plate, there being slots through said plate, in proximity to said lateral flanges, side-plates bifurcate at one end thereof and formed at the extremity of said bifurcations into hooks arranged at the extremity of said bifurcations into hooks arranged to engage said tread-plates through said slots, and a flexible tension device exerting a tension upon said plates in the direction of the center of the wheel.

Cash Prizes *for* Used Car Articles

Dealers: How do YOU handle the used car problem? Send your ideas to the editorial department for publication.

We have opened the columns of Motor World for the discussion of this serious situation. There ARE ways out of the difficulty maybe YOU have one. If not, read the other fellow's plans.

Motor World is determined to be a real help to dealers—to build its publication so it can be used as a text-book on how to run their business.

As ONE evidence of our determination to live up to this ambition we have decided to offer CASH PRIZES for the best contributions on one of the greatest evils in the selling of cars.

IT'S A SUBJECT WORTH DISCUSSING—one that is bound to clear the atmosphere, more or less, of the annoying, profit-losing "used car" evil.

YOU KNOW YOUR OWN TROUBLES in this matter—YOU have doubtless seen the hole through which YOUR profits have been slipping.

MAYBE YOU HAVE GRASPED the "used car" bull by the horns and found a more or less profitable way (or at least a partial stoppage of the leak).

GIVE US YOUR IDEAS. Yours and those of your brother dealer can, after publication, be worked into a composite theorem which will go a long way toward helping YOU individually.

ALL OF YOU GET TOGETHER and exchange ideas through the medium of Motor World.

IF YOU HAVE THE PLAN (or the germ of it) let us print it. It is to our interest as well as yours to help the dealer and the manufacturer to prosper, and the following offer is part of OUR contribution to the cause—giving your ideas publicity, is an additional offer.

WE WILL MAKE IT WORTH WHILE

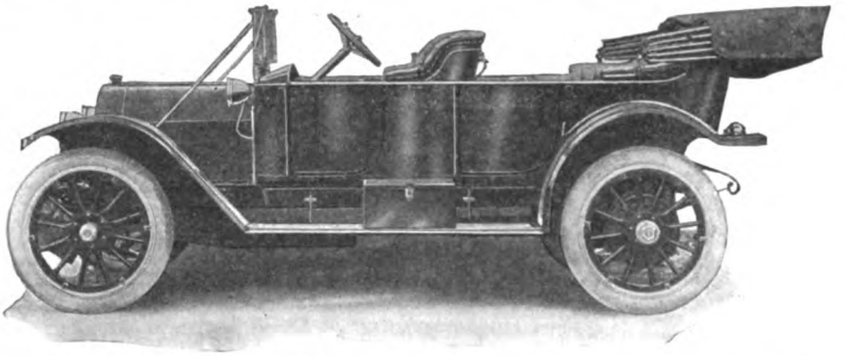
$50 for the best article on
$25 for the second best article on
$15 for the third best article on
$10 for the fourth best article on

How to Handle the Used Car Problem

HERE'S YOUR CHANCE TO NOT ONLY get in line for some ready money—it's also your chance to give and get ideas that will swell your bank account, through the mitigation of the "used car" evil.

YOU TELL US HOW YOU HANDLE the situation—and don't delay—be one of the first.

MOTOR WORLD PUBLISHING COMPANY
1600 Broadway **NEW YORK**



FILL OUT THIS COUPON

and we will send full particulars of contest if you need them, but send in your contribution at once if you can.

INTELLIGENT DISTRIBUTION

Do You Go After the Prospect or Does He Come To You?
Do You Sell the Car or Does He Buy It? IT'S IMPORTANT

HAVE you ever stopped to wonder just what will happen when DEALERS will sell AUTOMOBILES along the same modern business method as employed in the sale of cash registers, typewriters and insurance?

Isn't it a fact that a large percentage of DEALERS actually do business on a "brain memorandum"? How many dealers have installed a "possible purchaser list," a "follow-up system" or a "checking list" to keep in touch with competitors' sales?

YOU KNOW all the DEALERS in your territory, the cars they represent and the number they sell. Are any of them employing the selling methods that are even comparable to those in vogue with the sewing machine dealers?

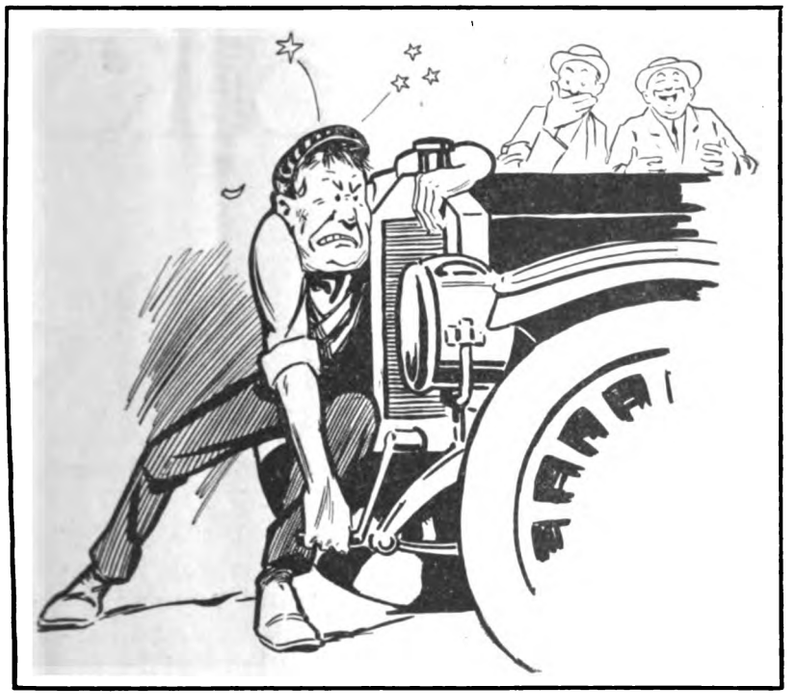
You know the answer—they are doing business along the same lines they would have pursued if AUTOMOBILES were manufactured 100 years ago. Just waiting for the PURCHASER to drop in and sell himself.

THE ABOVE CONDITION ACTUALLY EXISTS IN EVERY TERRITORY. SOME DEALERS ARE YEARS AHEAD OF OTHERS AND ARE ANXIOUS TO MODERNIZE—BUT

If You Were A Pullman Dealer

you would have the backing of the PULLMAN SALES MAKING ORGANIZATION, a twentieth century distribution department that SHOULD be the 51 per cent. part of any manufacturing business.

A perfectly developed "PRODUCER" that spends thousands of dollars (our plan on request) to locate your possible purchaser, to get you in touch, to separate the "live prospects" from the "maybe's."



BRIEFLY—We are building 500 extra PULLMANS for 1913. Fifteen hundred in all. Our present dealers have spoken for 1,000, and the increase is for new territory—possibly yours is open.

FOR 1913 WE OFFER THREE NEW MODELS—ALL FULLY EQUIPPED:

4-36	4-44	6-66
$1675	$2150	$2750

PULLMAN MOTOR CAR CO., YORK, PA.

Foreign Cars of Real Class Use Wire Wheels

To write the names of the foreign cars that use wire wheels is to list almost all the cars of class which are made abroad. In the foreign countries the adoption of wire wheels means only that wire wheels are superior. Foreign manufacturers do not wait until popular demand forces them into a situation. The sole deciding question is that of quality and advisability. Once the foreigners realized that wire wheels, by actual test, saved almost 70 per per cent. of tire wear and that they were superior in every way to wheels of any other type, they immediately adopted wire wheels as standard equipment.

Herewith is appended a list of some of the foreign cars, which use wire wheels, with which the American automobile industry is most familiar.

Metallurgique	Argylls	Calthorpe	Armstrong-Witworth	Hispano	Alcyon
Napier	Talbot	Gregoire	Pallidium	Suiza	Cote
Daimler	Star	Th. Schneider	Peugeot	Lorraine-Dietrich	Leon-Peugeot
Humber	Belsize	Vauxhall	Italia	Mathis	Sizaire-Naudine
Wolsley	Lancia	Stoneleigh	Minerva	Rolland-Pilan	Vinot-Veguingand
Austin	Siddeley-Desy

EXPERIENCE — SHELDON — RIGHT DESIGN
FACILITIES — AXLES — RIGHT STEEL
"Made in the Largest Axle Factory in the World"

Brake Equipment E-11

The latest and most radical improvement covering chain drive truck braking control and a subject for progressive engineers to investigate.

Both brakes located on rear axles eliminate braking strain on chain, and the bending moment on the jack-shaft.

The inside and outside arrangement show advantages over any other form of construction, keeping down the axle extreme bending moment and allowing bearings to nearly align with sprocket.

Various sections are figured for a truck load of 3000 lbs. or 50 per cent. overload, 80 per cent. being on the rear axle and skidding the rear wheels.

A 50 lb. foot pressure will bring this load to rest in the shortest possible braking distance, with a material safety ratio of 4 to 1 on all material.

There's a lot more to be said about Brake Equipment E-11, and the story is big with interest to every truck builder who is looking for efficiency and strength in this part of the machine.

ASSERT! PROCLAIM! EMPHASIZE!

To your customer the fact that Pennsylvania Tires are

Oilproof

and that this greatest of improvements is added to the only tires that have successfully solved the anti-skid problem—

PENNSYLVANIA Oilproof VACUUM CUP TIRES

The question of oil disease in tires has been avoided by tire manufacturers—because no preventative was forthcoming. Now you can offer your customers a tire that's as trouble proof as it is humanly possible to devise.

Oiled roads and pavements, oily garage floors and leaky tanks work havoc with tires. Not many motorists realize this. They only know that their tires often don't last as long as they should under normal use. It's oil disease! Pennsylvania Tires are immune against it. They're the first tires that are.

Stock Pennsylvania Oil Proof Vacuum Cup Tires and point out this splendid selling feature to your customers. Point out our famous anti-skid and long service guarantees, too. These unusual appeals, stimulated by strong consumer advertising, will make these the easiest selling tires of the year.

If you are already a Vacuum Cup dealer revise your orders upward.

If you are not yet handling Vacuum Cups—well, don't be left behind, that's all.

PENNSYLVANIA RUBBER COMPANY, Jeannette, Pa.

(Re-organized Feb. 1. 1910)

Pittsburgh, 505 Liberty Ave.

The Kentucky Thoroughbred — Ames "45"

The Story of a Change

By GEORGE W. YEOMAN

As a rule the beginning of all things was small. But this is different. It is a **big** thing that started **big** and got bigger. For years I had lived and worked in an atmosphere of motor cars. During that time I have become familiar with the merits or otherwise of more than sixty different makes of automobiles—some of the most popular and high-priced in America.

My Discovery — What I Saw

Some few months ago I heard rumors of a remarkable car that was being built in Owensboro, Kentucky. Its story read like a tale from the Arabian Nights. And I doubted—yes sir, I doubted. But still my agents brought me fact after fact, each bearing the ring of truth. So I decided to go to Owensboro to look over this masterpiece in automobiles.

What I saw there startled me. Such a silent, powerful, durable, comfortable and stylish car! I tested it as hard as ever a car was tested. I was determined to find a weak spot. **And I couldn't.**

An American Car for American People

I knew then why F. A. Ames, the greatest carriage builder in the South, had attained his undisputed position. For in building the Ames Automobile he had utilized the knowledge, **skill and experience that 30 years of first class carriage building had taught him.**

I saw in the Ames the one moderate-priced car in America that would be admired as much on Fifth Avenue or Michigan Boulevard as it would be in any other section of the country.

These cars, with bodies which looked as if they came from Brewster's or Kimball's or Cunningham's, surpass anything in the perfection of the carriage-builder's art that I have ever seen. Countless details of strength, refinement and beauty which cannot be secured from the ordinary automobile factory are embodied in this matchless car. The Ames "45" is the ideal American car for the average American.

A Real "Kentucky Thoroughbred"

The Ames "45" is a real "Kentucky thoroughbred." It shows the perfection of the carriage-builder's art in the beautiful lines of the body—in the luxurious hand-upholstered leatherwork—in the honest, careful workmanship attained by two generations of expert carriage builders. This, coupled with the sturdy Continental engine, used by over sixty of America's foremost automobile builders, together with other high-priced equipment, puts the Ames Car in a high-quality class alone.

Read These Specifications

MOTOR—Powerful four-cylinder **Continental**, unit power plant design, en bloc cylinders. Bore 4½ inches, stroke 5¼ inches. Three-bearing crankshaft. Valves enclosed. COOLING SYSTEM—Centrifugal force feed pump. Special design, ball-bearing fan, belt-driven. CARBURETOR—Schebler Automatic non-flooding, Model O 1¼-inch, hot air jacketed. HORSEPOWER—Forty. The motor will develop greater horsepower at high speed. IGNITION—**New Remy** dual system high tension magneto. LUBRICATION—Force feed plunger pump system with constant level. Oil driven direct to main bearings. SIGHT FEEDS—Oil indicators on dash. CLUTCH AND TRANSMISSION UNIT—**Warner** make. Multiple disc clutch. Discs, Raybestos lined, running either dry or in oil. Transmission, selective type, 3 speeds forward and reverse. Shaft mounted on annular bearings. ELECTRIC LIGHTS—Motor-driven dynamo with storage battery reserve. LAMPS—12-inch headlights, 7-inch side lamps, 6-inch tail lamp—all electric lighted. SELF-STARTER—Gas starter furnished as regular equipment. Positive acting, 100% efficient, compressed air or electric starter furnished on request at extra cost. SPEEDOMETER—The widely advertised $50.00 **Stewart** Model B. TOP—Best mohair on substantial frame. Side curtains and boot of same material. COLOR—Black body with gray wheels. AXLES—**Hess**, large size. Front, I-beam drop forged; rear, pressed steel, full-floating type. Both axles an annular bearings. BODY—"Amesbilt," aluminized sheet metal. Fore doors. Inside locks. Five-passenger touring car and two-passenger roadster. GEAR RATIO—3½ to 1. TIRES—34x4 inches, **Goodyear**, oversize "No-rim-cut." SPRINGS—**Special** analysis steel. Front, half elliptic, 36 inches long by 2 inches wide. Rear, three-quarter elliptic, 48 inches long by 2 inches wide. STEERING GEAR—Worm and gear type. Steering wheel, genuine walnut, corrugated, 18 inches diameter. Wheel on left side. UPHOLSTERY—Black No. 1 leather, long-grained, dull finish. Hand upholstered extra deep and luxurious. Filling, best curled horsehair. WHEELS—34 inches diameter, wood, artillery type, large hub flanges, heavy spokes. Rear wheel spokes bossed and bolted to brake drums. RIMS—**Baker**, "Bolted-on"—demountable. Extra rim and tire holder furnished as regular equipment. WHEELBASE—118 inches. DRIVE—Bevel gear, two Spicer universal joints, pressed steel torque arm.

Mr. Agent

Get the Great Ames Agency

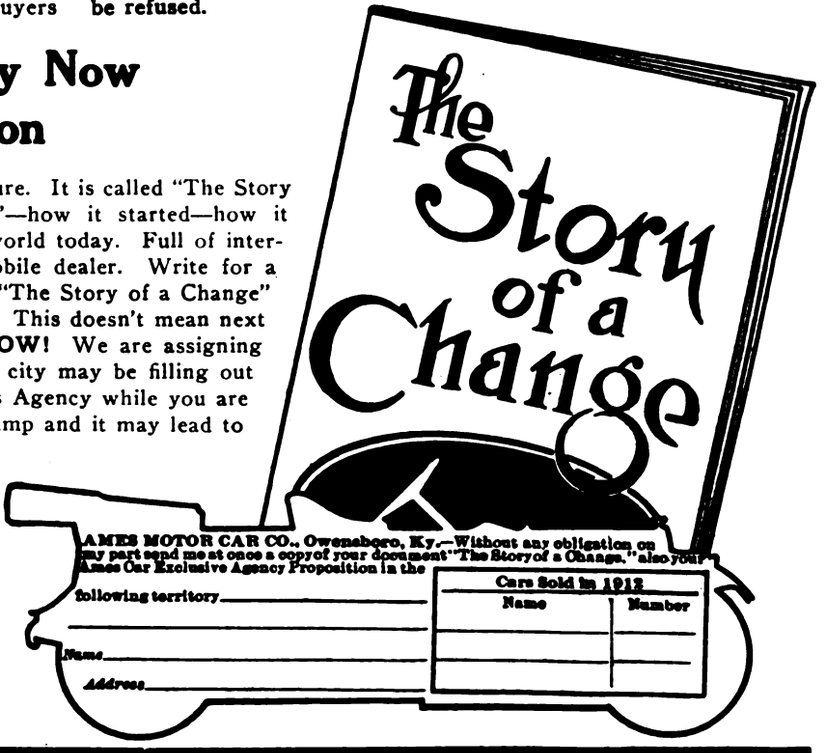
The Ames "45" Is Easy to Sell Because Its Big Value Is Evident

The Ames Agency is the most liberal and profitable 1913 agency proposition offered in America today. The car is the biggest value to be found anywhere. The men behind it stand for quality, integrity and square dealing. Made by specialists, backed by millions, the Ames has made good from the start. It was an instantaneous success. Ames cars could not be supplied to all who wanted them. But with our new big factory we can now make quick deliveries. Every car has the personal endorsement of Mr. F. A. Ames and is built under the direct supervision of Mr. George W. Yeoman. These two men—each the leader in his line—backed by $2,500,000—offer you a valuable asset in the Ames 1913 Agency.

Note These Sales Points **Long stroke, powerful Continental Motor—the only motor that has won the unqualified approval of automobile engineers the country over—Electric (Dynamo) Lights—Real Self-Starter—Left-Hand Drive—Full Equipment—"Amesbilt" Bodies and Tops. A combination of power, speed, endurance and graceful lines.**

How We Help You Sell the Ames "45"

We believe in the business-building power of co-operation. We look upon Ames Agents as partners in our business.



We recognize that we can succeed only in proportion to the success of our agents in selling Ames Cars.

Powerful literature, personal sales letters, carefully developed sales plans, strong newspaper advertising to automobile buyers where we have agencies—every facility known to experienced automobile sales creators is offered our agents.

The Ames Car is built to satisfy the most critical buyer. Ames Agents are expected to see that every customer is satisfied. To this end **no reasonable request that an agent may make of us will be refused.**

Grasp This Opportunity Now Send in the Coupon

We have written a wonderful piece of automobile literature. It is called "The Story of a Change." It tells the complete story of the Ames "45"—how it started—how it was discovered—how it stands supreme in the motor-car world today. Full of interest and information—a document of profit to every automobile dealer. Write for a copy today—it will pay you well. The coupon below brings "The Story of a Change" and our complete agency proposition. Get them both **today.** This doesn't mean next month or next week or even tomorrow but T-O-D-A-Y—**NOW!** We are assigning agencies for the Ames "45" every day. Some dealer in your city may be filling out the coupon below right now—he may get the exclusive Ames Agency while you are hesitating. Investigate—get the facts. It costs but a red stamp and it may lead to big, quick profits.

Hupmobile $975

These Features, and, Hupmobile Prestige—Two Tremendous Sales Forces for 1913

Long Stroke Motor—3¼ x 5½ inches.
Enclosed Valves.
Three Bearing Camshaft.
Unit Power Plant.
Multiple Disc Clutch.
Three Speeds Forward.
Sliding Gears.
Full Floating Axle.
Center Control.
Zenith Carburetor.
Bosch Magneto.
106-inch Wheelbase.
32 x 3½-inch Tires.
Quick Detachable Rims.
Mohair Top with Envelope.
Jiffy Curtains.
Windshield.
Rear Shock Absorber.
Prest-O-Lite Tank.
Gas Headlights.
Oil Side and Tail Lamps.
Tools—Horns.
Trimmings, Black and Nickel.
Standard Color, Black.
Magneto and Camshaft Driven by Silent Coventry Chain.

Here is a car at **$975** built in accordance with the high code of honor which marks the manufacture of the best cars—cars far above it in price.

It claims close relationship with those cars—not in size, because it is a car of lesser dimensions, of course—but in all the ingredients which constitute integrity of construction.

It asks to be set apart and judged, not by the standards its price would suggest, but by the more microscopic analysis that would be applied were a larger investment involved.

Buyers are keen enough to know that two cars of the same price can be far apart in real value.

They know that the difference in value arises from what is in the car, and not what is on it.

In the matter of men, machinery, material and methods, we claim kinship for this car, as we have said, with the very best.

And, in the matter of watchful workmanship, and processes calculated to produce precision, we claim first honors in the Hupmobile class.

We believe the Hupmobile to be a car of longer life and less friction; a car of fewer repairs, a car of greater care in small details; a car of greater efficiency and greater value.

The man who undertakes to sell the Hupmobile on the basis we have outlined here will find his way smoothed and competition easily overcome.

We have just prepared a book, picturing the various processes employed in Hupmobile construction which shows as graphically as the camera can the intrinsic merit and value of the car. We shall be pleased to send you a copy.

HUPP MOTOR CAR COMPANY, 1254 Milwaukee St., Detroit, Mich.

Delivery Wagon on Model H Chassis—$900 f. o. b. Detroit.
"20" Runabout—$750 f. o. b. Detroit, Including Equipment of Top, Gas Lamps, and Generator, Three Oil Lamps, Tools and Horn. 4 Cylinders, 20-H.P., Sliding Gears, Bosch Magneto.

"The Horn that's Made for the Discriminating"

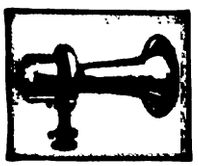
TUTO HORN

THE TWO TONE HORN

Why Preferred for Standard Equipment.

WHEN any particular device is selected for standard equipment by motor car manufacturers, the varying requirements of the complete sales territory must be considered and the majority of the discriminating customers satisfied, rather than a few of the "extremists."

¶ Freak body designs of limited usefulness and of flashy appearance are similar to the extreme in personal dress. Only the faddists affect or care for such conspicuous designs.



¶ The selecting of a warning signal for the 1913 car models has been partially defined by the demand for an electrically operated device.

¶ It is hardly necessary to add that such a warning device must have actual service utility rather than meet the demands of the few faddists.

¶ For complete signalling, the TUTO horn is the only warning signal that does it all, replacing the bulb horn by its low tone and furnishing a most adequate emergency signal by a more powerful note—either sounded at will and instantly, by the manipulation of one button; a light pressure for the low note, effective fully 90% of the time; a full pressure for the emergency note, demanding attention if the low note should fail.

¶ It is possible to go from the low note to the high note without thought or movement of the hands, merely increasing the pressure on the same button used for the milder signal.

¶ It is this complete signalling service that makes the TUTO horn the choice of the discriminating manufacturer for standard car equipment in preference to the inflexible, one-note loud horn.

Territory is going rapidly

Get yours without delay

We knew, of course, that the Warm Hand Wheel would get the attention of dealers—but we were not optimistic enough, because demand is bigger than we had anticipated.

There are plenty of dealers who caught the idea the moment we began to advertise—and more are getting in line every day.

The Warm Hand Wheel will sell wherever there is a driver who has experienced winter discomfort at the wheel—the "frozen stiff" hands or the clumsy gloves.

You, Mr. Dealer, can make him comfortable and happy by installing a Warm Hand Wheel on his car, and in the doing rob his winter driving of half its discomfort—and the total cost to him will be but $10, while your commission will be big enough to completely satisfy you.

The equipment is invaluable to motor truck drivers, and there isn't a concern operating such vehicles that will hesitate a moment to give its drivers the "warm hand," from a humanitarian principle if not as an added factor of safety in winter driving.

Now here is your opportunity—today—not next week or next month. There's a touch of winter's breath in the air already—shortly the cutting wind will send your trade to YOU if you are selling the Warm Hand Wheel—or to your competitor if he grasps the proposition first.

Remember, you can instal this device in a short time—and once on you will have no further trouble, for the Warm Hand Wheel cannot break or get out of order.

With it the driver can steer in the coldest weather without gloves, or with thin skin gloves if desirable.

Isn't that a pretty big "ten dollars" worth?

If you can see the big selling opportunity that hundreds of other dealers have seen—and acted upon—then write today for details.

THE WARM HAND STEERING WHEEL COMPANY

527 Fifth Avenue **NEW YORK**

A New Atwater Kent Ignition System WITH Automatic Spark Advance

This new system, known as the Type K, is noiseless and includes a method of automatically controlling the timing of the spark at any speed from three to seventy miles per hour.

The Type K System is practically silent—much more quiet than a magneto, and gives very much better results. Its efficiency, due to the construction of the contact maker and to the automatic advance, is higher than that of any other ignition device made.

The perfection of this automatic feature is the result of three years of hard engineering work to bring it to its present state of perfection, and we consider it the greatest step in ignition that has been made in several years.

For the last seven years, the Atwater Kent System has held its place as being unquestionably the best battery system in the world. During this time over **seventy-five thousand of our systems have been sold,** and practically all of them are in use today. They have not been sold because we coaxed people to buy them, but because one system has sold another.

During the period of the magneto fad, thousands of our friends who formerly used our system and *know* what it *was*, discarded the magnetos on their new cars and put on the Atwater Kent, claiming they got much better results with much less trouble.

Our manufacturing facilities and reputation have been such that we could have taken advantage of the magneto craze and manufactured magnetos. We could, undoubtedly, have sold large quantities of them, but we knew that our system was better than any magneto that could be built and so stuck to it. As a consequence we know more today about battery ignition than any other manufacturer.

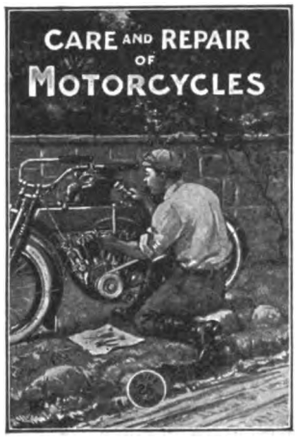
During the seven years that we have been manufacturing our system we have acknowledged that the magneto had the advantage of us on only one point—it generates its own current and therefore needs no battery, but today with the general adoption of electric lighting and therefore a plentiful supply of current from a dependable source which is available for ignition as well, what advantage has the magneto over our system? **Absolutely none!**—and on the other hand, **the Atwater Kent System has many over the magneto.**

This new Type K System has been our pet for over three years. Our whole engineering force has been working on it, making one model after another, perfecting, simplifying, cutting down cost of manufacture, and but few have known that we were working on it.

During the past year we have had our entire tool force making tools, fixtures, and machinery for producing this Type K in quantities. We have refrained from making any announcement until we had our factory in such shape that we could make prompt deliveries, realizing that it was useless to announce a good thing until we could give the public prompt delivery and satisfy the unquestionable demand.

The most wonderful feature of the new Type K System is the automatic spark control. A moment's thought will show that the setting of the spark should not be left to the discretion of the operator—at best, he can only guess the proper timing and even if he knew this definitely, he could not constantly shift his sparking lever to get the full efficiency of his motor at all speeds.

Our automatic spark control is really a self advancer and self-retarder. It begins to operate when the car is running at three miles an hour on the high gear and keeps the spark at precisely the proper position at the highest speed the car can possibly run. Below three miles an hour, the spark is at its proper position so that even though it were possible to run the car on high gear at two miles an hour or one-half mile an hour, the spark would always be correct. In the starting position the spark is properly retarded.



Another feature of the Type K System is that the primary circuit is not grounded, the contact maker being thoroughly insulated from the rest of the mechanism. This is of special value when the ignition current is taken from the lighting circuit.

One glance at the Type K will convince you of its unquestionable superiority in workmanship and of its simplicity and sureness of operation. Every manufacturing detail that enters into this system is as near automatic as possible, so that all parts are interchangeable and absolutely perfect.

Write today for further information, prices, etc.

A trouble saver for the motorcyclists

This book contains more practical advice for the rider, more good hard sense, more suggestions as to how to keep out of trouble, and how to get out of it, than has ever been printed heretofore in any one book.

¶ It fits the coat pocket and it includes free engine clutches, two-speed gears, mechanical lubricators and magnetos, together with special matter on motors, valves, carbureters, fuel and important general subjects, all plentifully illustrated.

¶ Dealers and jobbers in all parts of the country are selling "Care and Repair of Motorcycles" to both new riders and veterans as the best aid in correcting and avoiding motorcycle trouble.

MAXIMUM PRACTICAL VALUE

FROM EVERY VIEWPOINT the Hyatt Flexible Bearing presents advantages practical as well as theoretical. It is the result of a happy combination of a correct theory and modern manufacturing methods.

A QUALITY BEARING is the sole product of the Hyatt factory—quiet, efficient, simple and durable. It is flexible and non-adjustable. Into it are put the best steels obtainable, all carefully tested in the Hyatt laboratories and heat-treated to give them maximum possible strength.

ADD TO THIS the service which an efficient organization can render to car builder and car user through its sales and mechanical departments. Hyatt service constitutes an absolute insurance against bearing difficulties.

THE STORY IS TOLD in three significant words—"Maximum Practical Value."

HYATT ROLLER BEARING CO.
DETROIT, MICHIGAN

Digitized by Google

JENCICK

The car designer who reads this will quickly form a concrete idea concerning Jencick quality—and cost. After that it is largely a question of "Will it pay to get engine durability and efficiency at a higher price."

JENCICK QUALITY

BASE: Manganese bronze, an absolutely rigid metal that must hold crank shaft, cam shaft and other bearings in true alignment. Binding is impossible. Cost per pound 3 times greater than aluminum.

CRANK SHAFT: Krupp Chrome Nickel Steel, extremely hard and cannot wear oval. Retains true diameter forever. Resists crystallization. This material, oil hardened, has a tensile strength of 135,000 pounds per square inch, elastic limit 114,000 pounds. Cost per pound far in excess of nickel or carbon steel.

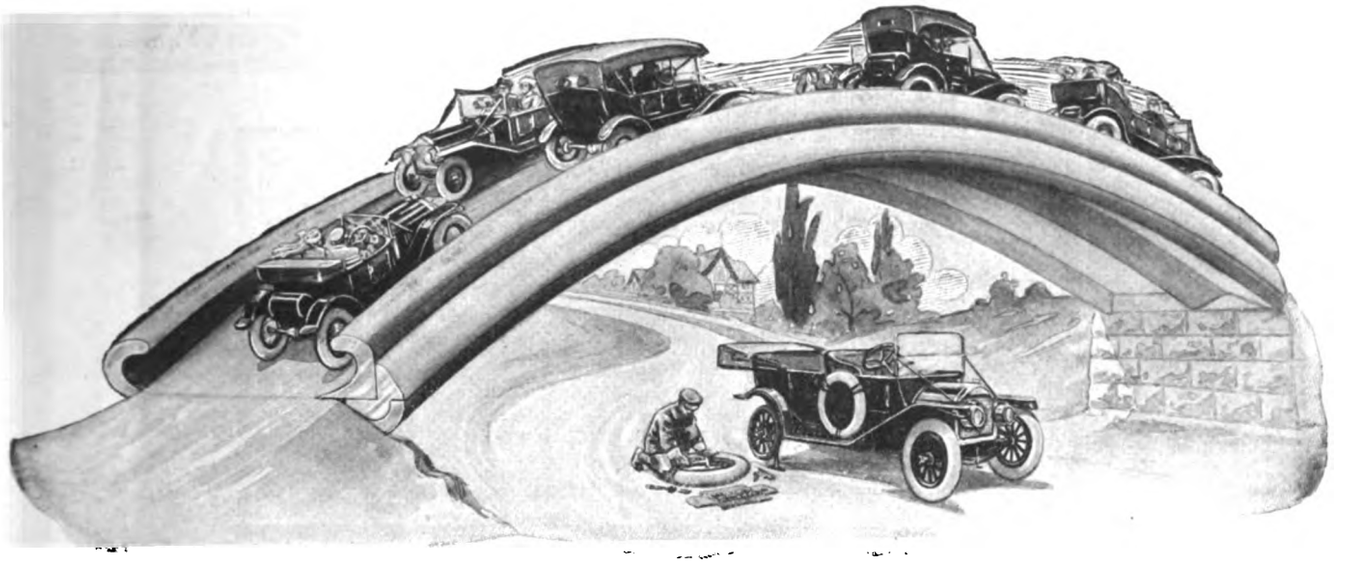
CYLINDERS: Semi-steel, close grained and hard enough to reduce wear to a minimum. High tensile strength. Uniformly hard. Will maintain true diameter always, under all conditions. Leaking is impossible. Cost of production again high.

PISTONS: Semi-steel or Vanadium cast iron. Principal qualification lightness. Wear-resisting. Practice dictates that piston and cylinders be made from same material. Light weight accomplishing a great foot pound saving. More expensive than cast iron. This goes without saying.

Ordinary Quality

BASE: Aluminum or cast iron, both with considerable spring. Constant torque and vibration will quickly destroy bearing and shaft alignment—result, worn bearings, friction and trouble.

CRANK SHAFT: Nickel or carbon steel. Even if oil hardened cannot approximate efficient service. Shafts wear oval. Pounding takes place and bearings are destroyed. Tensile strength and elastic limit 50% less than the kind we use.



CYLINDERS: Gray cast iron. Light tensile strength. Porous and bound to leak. Wear during first and second year very noticeable. Will show a tendency to rip off foundations especially if built light.

PISTONS: Cast iron or other poor material, conducing to wear and poor service on same lines as indicated in ordinary quality cylinder. Set of four will weigh 4 pounds more than if they are made of better material, meaning a loss of foot pounds running into millions during life of machine.

Here are four out of many QUALITY REASONS explaining why Jencick engines stand in a class by themselves—why they cost more to produce and why the length of service and satisfaction they offer is far in excess of the difference in cost price.

Motor Truck engineers will find the complete story of this engine intensely interesting. Write for the information.

The Bridge Over Tire Troubles

Forget tire mishaps. They need worry the car owner no longer. There is a bridge of Security and Tire Protection —an Insurance against car delay and tire decay in

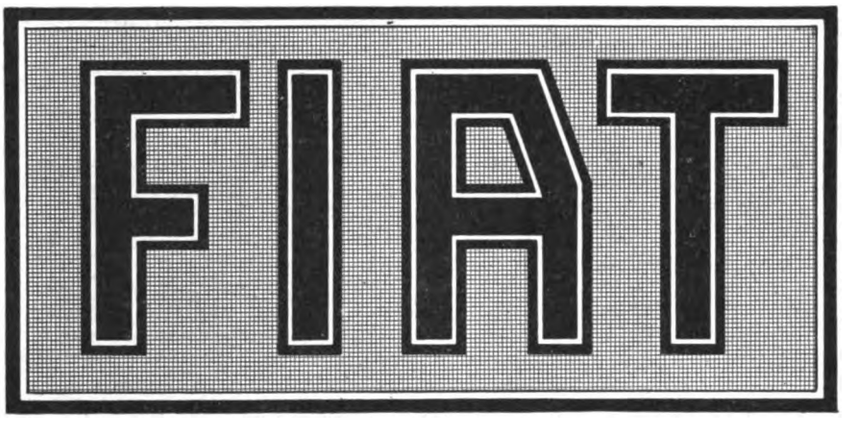
Firestone

Quick Detachable Demountable Rims

For All Types of Tire - Clincher or Straight Side

Prevent Car Delay — An ordinary wrench loosens six clamps —and rim slips off. Any tool, with thin, flat edge, will remove locking ring, and tire is detached from rim while latter is on or off the wheel. Puncture or blow-out mean nothing but a simple operation, consuming four or five minutes' time.

Prevent Uneven Wear— Firestone rims have continuous bearing support—give perfect seating to tire. Tire is always in full circle — rounded surface is presented to road. The Firestone wedged shaped clamping ring holds rim always in true.



Prevent Tire Decay—Moisture or foreign substance cannot get in to ruin casing or tube. Firestone No-split base prevents.

Light in weight, reasonable in price, the one practical, sturdy, economical, quick detachable, demountable rim made.

Firestone Rims are the regular equipment adopted by a fast growing number of foremost car builders.

American

Give the maximum of efficiency, with the option of bevel or worm drive

Axle efficiency is the basis by which you must measure your car's maintenance expense.

This is especially true of electric vehicles which leave the garage with a fixed quantity of stored energy.

Every unnecessary ounce of friction that must be overcome must be paid for in current.

American Axles, because of their distinctive, patented features—which make for easiest running—assure the maximum of mileage from your batteries.

It is false economy for you to disregard this most important and practical feature.

American Axles now include the Lanchester-Daimler Worm Gear, to which we hold the exclusive rights as axle manufacturers in this country, through the Warner Gear Co., of Muncie, Ind.

They are made with the same superb degree of refinement that characterizes our Bevel Drive axles, well known as the first to be used in electric cars.

Some Facts on the Dealer Question

Has this fact ever been brought to your attention—that most Automobile dealers today are **one-car men**; that in any one territory there are **nearly as many dealers as there are cars represented.**

Yet **all** automobile buyers are **strictly and rigidly** separated into **distinct classes** according to the various prices they can pay for their cars. **Any** one car, no matter how good, or how high or low-priced, can appeal to and can be sold to only ONE CLASS of buyers—**and ANY ONE CLASS is always a very small portion of the market.**

This condition **must** and **will** change in the near future. The rapid change and shifting of agents and agencies everywhere proves that it is becoming constantly more difficult for the "one-car" agent to get by. And the agent of the future instead of depending on one or two cars will unquestionably have a complete line Instead of fighting for a share of a small corner of his market he will handle a car for **every class** of buyer, and therefore will have a fair chance at every prospect be approaches regardless of his needs.

To supply the middle priced car the car of the **logical price,** which permits the best of workmanship and material, and clean cut design—the car chosen by the largest number of experienced motorists, who buy for value, for the largest possible service for the price they pay—to supply this important class of buyers of both pleasure and commercial machines, **we offer you—**

Specifications

FRAME—Pressed Steel, cold rolled strip stock.

MOTOR—Vertical, water cooled, cylinders cast in in pairs with valves in head, 4⅜-inch bore by 5-inch stroke.

LUBRICATION—Constant level splash system, with gear pump and oil reservoir on bottom of crank case. Sight feeds on dash.

DYNAMO LIGHTING—Apple System, with Bosch ignition.

CARBURETOR—Stromberg, water-jacketed admission pipe.

CLUTCH—Special Dorris Dry Plate multiple disc, housed in the fan fly-wheel.

TRANSMISSION—Three-speed, selective type, sliding gear, mounted on Timken Roller Bearings and running in oil.

DRIVE—Propeller shaft with double universal joint and a straight line drive under load.

REAR AXLE—Full Floating Timken with differential and wheels carried on Timken Roller Bearings, adjustable for wear. Differential removable through rear of axle housing.

FRONT AXLE—Drop Forged "I" Beam Section wheels carried on Timken Roller Bearings, yokes and steering arms steel forgings. Steering Connection cross rod behind front axle.

STEERING GEAR—Irreversible screw and nut construction in which one adjustment takes up all play.

CONTROL—Spark and throttle on left side of steering column under wheel.

GASOLINE TANK—Copper, Sixteen gallons under front seat, with pressure pump for emergency.

FENDERS—Sheet Steel with metal shields. Splash guard between running board and frame. Smooth finish.

SPRINGS—Rear spring suspension is a three-point platform. Length of side spring 46 inches; rear, 40 inches. Front spring semi-elliptic, length, 37 inches; width, 2 inches.

BRAKES—Both on rear wheels, 14-inch diameter by 2½-inch face. Foot brake internal expanding; hand brake external contracting. Both equalized.

RADIATOR—Vertical Tube with square intersections, Mercedes type.

WHEEL BASE—121 inches.

TREAD—Fifty-six inches.

CLEARANCE—Under all parts of car, ten inches.

WHEELS—Wheels 36 x 4 inches.

RIMS—Number Three Universal Demountable Detachable Rims.

TIRES—Tires 36 x 4 inches, front and rear. Goodyear, Goodrich or Diamond; optional.

STARTER—Disco Type.

UPHOLSTERING—Finest genuine leather, Rough Rider Springs and ventilated buttons in cushions.

WEIGHT—Thirty-two hundred and fifty (3,250) pounds.

EQUIPMENT—Mohair or Pantasote Top and Dust Cover, Folding Rain Vision Shield, Sixty-mile Stewart Speedometer with season and individual adjustable trip register. Special Tire carriers in rear, one Extra Demountable Rim. Two 12-inch Castle Electric Headlights, two Castle Sidelights and one Tail Light (combination oil and electric). Monoplex Electric Horn, Robe Rail, Foot Rest, complete set Tire Tools, Jack and Tool Kit.

STANDARD COLORS—Touring Car dark blue or Brewster green.

The Silent Car

The Dorris Line of Pleasure and Commercial Cars

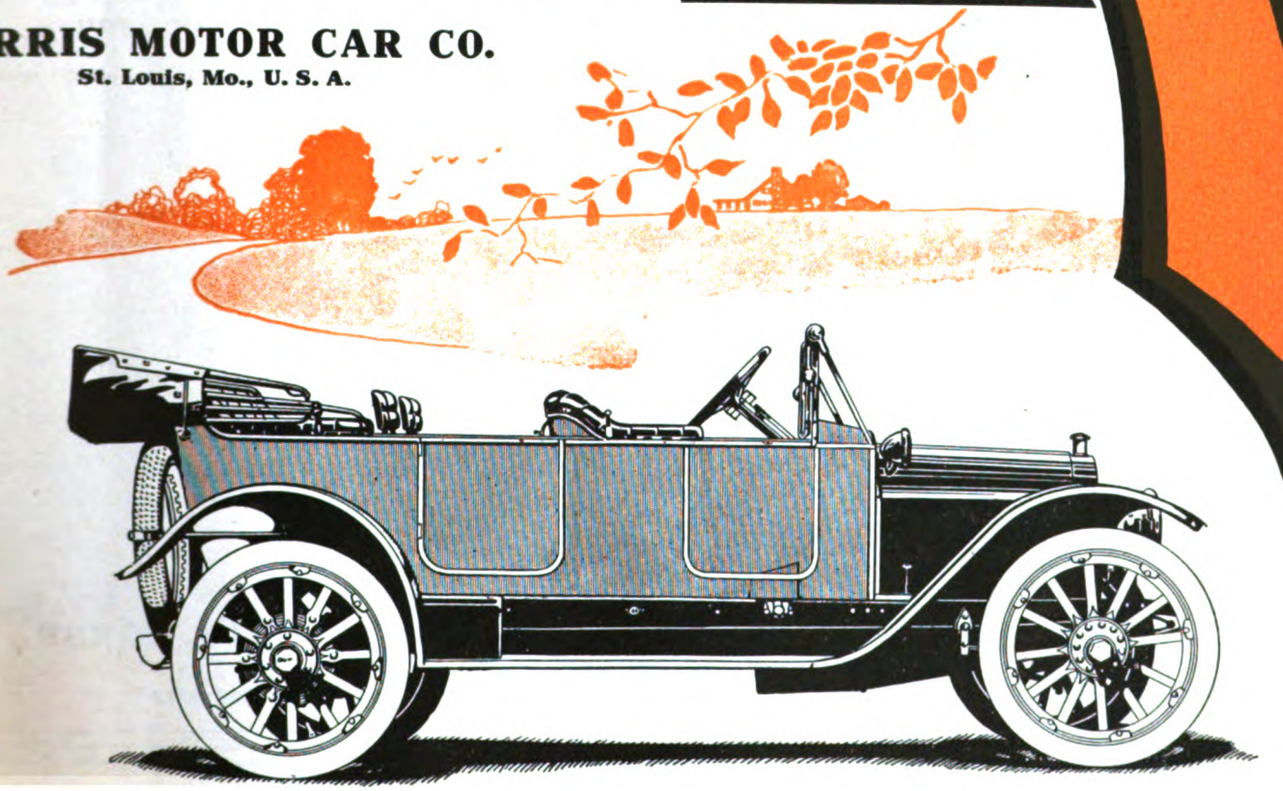
BUILT TO LAST

PLEASURE CARS	COMMERCIAL CARS	
$2500 to $3600	3-4 Ton	2 Ton
Electric Started and Lighted	$2100 to $2500	

The Dorris presents the happiest combination of price and quality of any car on the market. It is roomy and luxurious, smooth-running, easy on long tours, and has a reserve power that makes it one of the most famous hill-climbers on the market.

It is the most exceptional performer built today, which is the real basic reason of its success and universal satisfaction. It gives that smooth, silent, willing service, dependable and uniform year after year, which satisfies the rosiest expectations of the new buyer and rekindles the road-cooled enthusiasm of the veteran motorist.

Eight years of conspicuous success, without a single fundamental change in design—this is the most convincing possible proof of superior construction. And the exceptional record of the car in service abounds in evidence of its stamina and durability.



Below are the specifications of the Dorris Model H. Compare it carefully with anything else on the market of anywhere near our price.

Then write us—for we have a proposition which will interest you.

Dorris Commercial Cars

One of the MOST LUCRATIVE FIELDS in the Automobile business today **in every territory** is the Commercial Car end. And there is no limit to the business possible to an energetic man with the Dorris Line. Write us for full information.

Gentlemen:-

In reply to your inquiry asking for an expression from us as to our experience in the use of your motor trucks, would state that the fact that we have just placed a new order with you for six 4-cylinder, Model "R-15", 3 ton trucks, should be sufficient evidence that our experience with your trucks in the last five years had been most satisfactory.

We have used Knox motor trucks exclusively for over five years and as we have used no other make, can give no comparison as to the efficiency, up-keep, etc., but it is sufficient to state that our experience with your machines has been so satisfactory we have just placed with you the above order. Our experience with your machines and the courtesies extended by your company have been so satisfactory that we take pleasure in adding our testimonials to the many others you already have.

Very truly yours,

Knox

"Little Six"—The Balanced Car

Aside from its ample reserve power, unexcelled flexibility and rare beauty of design and finish, the new Knox "Little Six," Model 46, embodies many features which mark a new epoch in Motor Car refinement.

One of these highly desirable qualities is correct balance and absence of disagreeable vibration, a result toward which automobile engineers have been striving for years; incorporated as one of the quality "ear marks" of Knox Model 46.

As proof of the above statement we call attention to the following cut showing two pencils balanced on the headlights and a glass of water on the radiator cap with the motor running, taken from an actual photograph.

This is the most exacting test of balance that could possibly be imposed, and proves the thoroughness with which every detail of 1913 Knox cars has been worked out.

Ask for a demonstration of this convincing test at your first opportunity.

"BRAKES REFUSED TO WORK"

AUTO CO. SUED.

Ridgefield Woman and Her Chauffeur Are Plaintiffs.

In the [illegible] it was on July 6th that Chauffeur Ponquit took the machine to Danbury. He did not get to Danbury for when the automobile was on a hill things went wrong, all the brakes refused to work, the machine slipped down the hill, toppled over into a ditch and he was injured. He asks for $2,000 in his suit. Mrs. Colt

This accident could not have happened if the car had been equipped with DUPLEX brakes.

Many Accidents Are Due to Faulty Brakes

Don't take chances. Don't gamble. Be sure and certain about your brake equipment. Brakes that won't act instantly—that won't hold the car forward or backward—are not the kind of brakes you want.

DUPLEX EXTERNAL BRAKES

Will hold a car from moving backward as well as forward

They are real brakes. They act instantly with slightest pressure. Large braking surface, finest material, best design.

Specify DUPLEX Brakes on the car you buy.
If you have had brake troubles—write us.

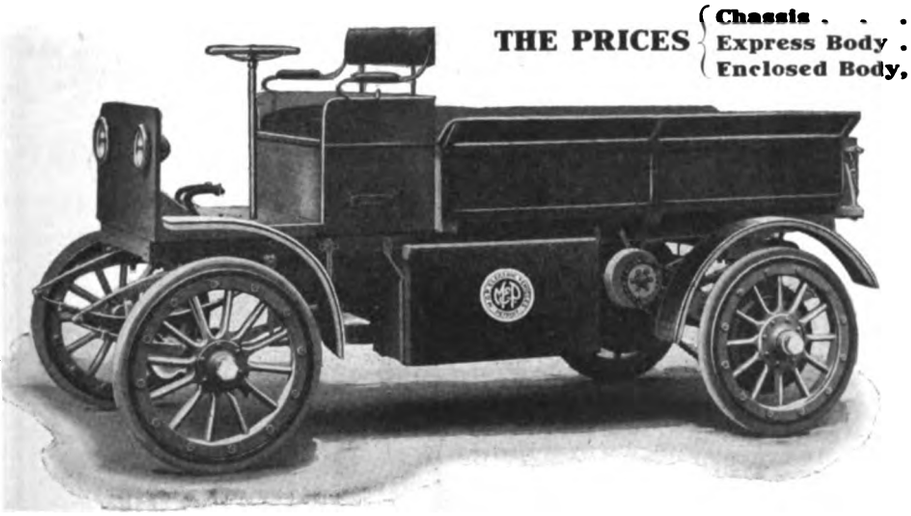
"MADE TO MAKE GOOD AND IT DOES"

THE M & P Electric one ton truck is a tried, proven and found good machine, selling for $1500 to $1600 and giving dollar for dollar more and better service than the mediocre gasoline truck at a price much higher.

Powerful, Speedy, Easily Operated

This vehicle is not an experiment—but a powerful, easily operated and speedy delivery car, with operating cost far below that of the higher priced internal combustion truck.

We find that it is striking a popular chord among a great number of business men who have been looking for an economical and speedy delivery method that could be had without an excessive initial cost outlay.



Our dealers are successful—our customers are well pleased—because this handsome, sturdy vehicle is making good wherever sold.

The M & P Electric one ton truck embodies simplified design and high grade material which make the prices from $1500 to $1600 clear out of proportion to its working value—and you cannot side-step the fact that it gives service far in excess to that of high priced gasoline trucks.

Get Our Dealers' Proposition

The proof of this is at your disposal, Mr. Dealer, the minute you want it. Write and make us make good our claim. The returns from your inquiry will be satisfactory.

Enjoy Your Ford Car

—get all the luxurious ease and comfort from it that the highest priced car can give.

THE FORD "J. M."

makes this easily possible. Unlike some shock absorbers, it does not arrest or lock the action of the springs—but serves as a perfect auxiliary to them, making riding doubly pleasurable, and cutting down wear and tear on tires and car.

Booklet "W" tells why thirty-five dollars invested in Ford "J. M." Shock Absorbers makes your Ford Car the equal in riding qualities of a five-thousand-dollar one. Write for it *today*.

Schafer Ball Bearings

The "Schafer" ball bearings are the standard of the world. They have been for years at the pinnacle of merit, and remain there because of exceptional workmanship, and the care taken in every step of the manufacture.

The ball bearings are made of especially analyzed, extraordinarily dense crucible cast steel, that combines uniform hardness with toughness from center to surface. All balls show a wonderfully great crushing strength and any ball showing the slightest defect is promptly rejected.

In specifying Schafer Ball Bearings, the manufacturer of the car is assuring the ultimate buyer of one point of quality that goes to make a good automobile still better.

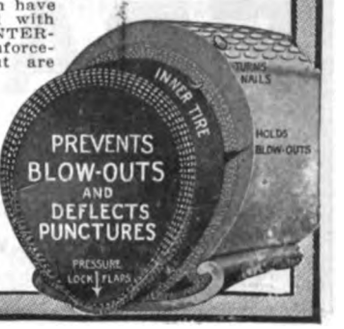
INTERLOCK INNER TIRES
Stop Tire Troubles

INVESTIGATE AND LEARN WHY SO MANY THOUSANDS OF MOTORISTS ARE DISCARDING INNER SHOES, RELINERS, FILLERS, AND OTHER MAKESHIFTS FOR INTERLOCK INNER TIRES—AND WHY INTERLOCKS ARE HANDLED AND RECOMMENDED BY THE BEST SUPPLY DEALERS AND TIRE HOUSES ALL OVER THE COUNTRY.

One weak point of the automobile to-day is that you can't depend on its tires. INTERLOCKS revolutionize this condition by making your tires so strong that blowouts become practically impossible. INTERLOCKS save half your tire expense—save repair bills—double your mileage—prevent punctures and completely free you from all fear of tire trouble.

What INTERLOCKS Are.—The INTERLOCK is a complete inner tire (not an inner shoe) which is placed between the outer casing and the inner tube to strengthen the outer casing and protect the tube. It is the only reinforcement which is locked by air pressure to the rim and which becomes an integral part of the tires, and, therefore, cannot heat or chafe. Even if the tire is broken the INTERLOCK will hold.



INTERLOCKS Insure Safety.—You know that the sudden blowing out of a tire may easily ditch any car when going at fair speed—the safety of INTERLOCKS should appeal to you.

Reduce Your Tire Expense.—You can have the tires on your new car equipped with INTERLOCKS if you specify them. INTERLOCKS are the only perfect tire reinforcement. They cost a little more but are cheapest in the long run.

For your present car—ask any dealer or supply house, or write to us for the name of your nearest supply source. INTERLOCKS will make any fairly sound tire more than carry you through the season. They are easily placed and are made in all sizes.

We Want Dealers Everywhere.—Write for Special 30 Day Offer, Booklets, Prices, Records of Road Tests and Testimonials of users.

If You Need Motor Lamps

You Need This Catalog

We want you to write for the Solar Catalog before you decide on your motor lamps, for this is the most complete line of lamps on the market. Solar Lamps have been preferred by most motorists for the past fourteen years because of their brilliancy, their style, their strength and their several exclusive advantages—their special short focus lead glass lens mirror reflectors—the patented double ray light projection (in the Solarclipse), giving two distinct fields of light, for city and country use—the new black finish, the only such finish that's proof against heat and moisture—and other features that other lamps lack.

To fail to see Solars before you buy is to fail to include in your consideration the very finest lamps in existence. Solars are made for oil, electricity, gas and in combination, for pleasure cars, motor trucks, carriages, motor boats and airships. Write for catalog now—while you think of it. (136)

FRANKLIN MOTOR CARS

AVERAGE

400 MILES TO THE GALLON OF OIL

This is proof of the superiority of the Franklin re-circulating oiling system:—

And of the high efficiency of Franklin direct cooling.

It is double the average mileage per gallon of oil obtained by owners of water-cooled cars.

Franklin re-circulating oiling system delivers a steady stream of oil to each of the main motor bearings through separate leads. It is the only oiling system that feeds oil positively and directly to each of the main bearings.

The amount of oil pumped over the bearings is proportional to the needs of the motor. The faster the motor runs the more oil supplied. This means perfect lubrication under every condition of running.

K·D

The Motor With the Sliding Crescent Valve
KNIGHT-DAVIDSON
1896 — 1912

The CRESCENT valve of the K-D Motor, fitting around the stationary piston wall affords a larger port area than any other poppet or slide valve on the market. It is simpler and, consequently, better than any other valve construction known and is here offered to discriminating manufacturers, not as an experiment, but as a tried, tested and proved mechanical advance. The K-D motor is simple, silent, cools rapidly, has the simplest oiling system known, will not carbonize. Last and most important, will give on a given quantity of fuel more power, speed and endurance, unit for unit, than any other engine on any type of an automobile. We want to present some facts to interested manufacturers.

KNIGHT-DAVIDSON COMPANY, Boston, Mass.

Weed Chains
The Great Anti-Skid DEVICE

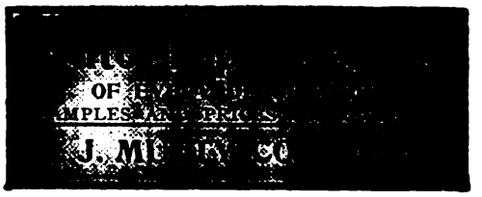
Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires
Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.



For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

15 cents per line of six words, cash with order: — In capitals, 25 cents per line —

A market place where Dealers, Jobbers and Manufacturers may buy, sell or trade used cars, parts and appliances and where help or situations may be secured at a nominal cost.

THE STEVENS-DURYEA COMPANY HAS ERECTED AND EQUIPPED A MODERN AND UP-TO-DATE FACTORY FOR MANUFACTURING THEIR OWN BODIES AND IS NOW READY TO RECEIVE APPLICATIONS FROM FIRST-CLASS WORKMEN IN THE SEVERAL BRANCHES OF BODY BUILDING: BODY MAKERS, SHEET METAL WORKERS, PAINTERS, UPHOLSTERERS, ASSEMBLERS, ETC. ADDRESS: SUPERINTENDENT, STEVENS-DURYEA COMPANY, EAST SPRINGFIELD WORKS, SPRINGFIELD, MASS.

MANUFACTURERS!

As attorney for the heirs of an immense estate, I desire to connect one of the heirs with a reliable automobile manufacturer in an executive capacity, where he can enter the firm, by investing a substantial sum in about six months, at which time he will receive his share to the estate.

Thoroughly familiar with the selling end of commercial vehicles, thoroughly understands conditions relative to the sale of commercial cars in New York City and vicinity, and has plenty of prospects. Has thorough business training, clever correspondent, and capable of meeting and conversing with men of affairs.

Would prefer to manage New York branch of reliable truck firm, but would consider proposition from pleasure car firm, or manufacturers of any reliable lines connected with the automobile trade.

Selling agencies, please do not waste your time or ours answering, as we desire to hear from manufacturers direct.

State fully what you have to offer, also salary and opportunity for investment of the funds, which will be available in about six months.

Address "EXECUTOR,"

444 59th St.,

Brooklyn, N. Y.

Glide

In 1917—Five Years Hence

the 1913 GLIDE will still be a **modern,** serviceable car. Why? Because the present GLIDE leaves but very little that can possibly be improved upon.

It is far ahead of many 1913 cars—and **no** car is **leading** the GLIDE in high-class materials, construction and all of the newest equipment.

The 1913 GLIDE is **electric lighted**—simply turn a button and all lamps are on!

The GLIDE Motor-Driven Tire Pump eliminates drudgery. Also **saves your tires** by keeping them fully inflated at all times to any desired pressure.

Electric **Bull's Eye** Side Lamps are **sunk in dash,** eliminating rattling, minimizing breakage and adding to the classy appearance.

The GLIDE Self-Starter is **sure** of a spark—**investigate** and learn **why** the GLIDE starter is **efficient.**

Simple center control, left side drive, demountable rims, irreversible steering gear—and in fact **all** the newest features of known worth—establish the "class" of the 1913 GLIDE.

Make a memo—right now—to write us for detailed description of the entire GLIDE line.

"36-42" Features

Automatic Dynamo Lighting System
Motor-Driven Tire Pump
Unit Power Plant
Long Stroke Motor with *enclosed valves*
Center control
Left Side Drive
Bull's Eye* Electric Side Lamps *Sunk in Dash
Electric Headlights and Tail Lamp
An *Efficient* Self-Starter
Floating Rear Axle with Pressed Steel Housing
Demountable Rims (Baker Bolted-on)
118-inch Wheel Base

You can't get GLIDE quality, equipment and service **in any other car** at the GLIDE price. Make us prove it! You can pay **more** and get **less.**

Our price includes complete equipment, as follows: Dynamo, Mechanical Tire Pump, Self-Starter, Mohair Top, Top Boot, Glass Front, Electric Headlights, Side Lamps and Tail Lamp, Demountable Rims and One Spare Rim, Model B Stewart Speedometer with Grade Indicator, Spare Tire Carrier. Full quota of tools and jack, all nickel trimmings.

5-Passenger "36-42"

$1690
Fully Equipped

Other Styles: 2-Passenger "36-42," 2, 4, 5 and 7-Passenger "45-50," Delivery Cars, Police Patrol and Ambulance

Dealers

The extraordinary quality and equipment of the GLIDE is apparent to the most experienced. It not only sells itself, but every car sells others.

Model 42

$3,000 F. O. B. Detroit

Arrived!

IT'S here—the electric automobile for which you have been waiting—***The Detroit Electric Clear Vision Brougham for 1913.*** It is driven from the front seat, all seats facing forward. You not only have a clear vision of the road ahead, but in addition you have a clear view at either side or the rear as there are no corner panels to obstruct the view. Glass has even replaced these rear corners, formerly built of wood.

After years of effort, we have solved the problem of a standard body design that is destined to be a classic of the body-builder's art—always in style.

A new and clever seating arrangement permits all of the occupants to face forward and still enjoy the privacy, sociability and dignity characteristic of electric automobiles. The driver's seat is not in an isolated position—way up in front. It is centrally located, thus ensuring an appearance of easy grace and balance, even when one person is using the car.

Larger wheels will be used in 1913—34"x4" Pneumatic or 36"x4" Cushion Tires being optional.

The battery capacity has been increased. This applies to both the Edison and Detroit Electric Guaranteed Lead Batteries. *All* battery cells are immediately accessible.

Our motors, controllers, bodies—even our Guaranteed Lead Batteries—are all made in our own factory. ***We do not assemble—we build.***

To Automobile Dealers Everywhere

HERETOFORE our business has been mostly centered in the large cities. We believe, however, there is a real business opportunity for the right dealer in every town of 10,000 or over, in which the Detroit Electric is not now represented.

Any city or town in which electricity can be bought, affords a market for electric automobiles. Isn't your line incomplete without electrics?

Think how many times you have had inquiries for them. Doesn't this indicate a growing interest in the electrically driven automobile.

In its present highly developed state, the Detroit Electric, if properly handled by you, means increased business with a comparatively small added investment.

It will pay you to investigate. We will be glad to give you special information and practical assistance. We desire only permanent connections that will be mutually satisfactory.

By signing the coupon below, you will put yourself under no obligation, but may open a way towards a greatly increased business.

Remember that the Detroit line is absolutely complete. It includes eight models in pleasure cars and a full line of electric trucks. All are made in our own factories and guaranteed by our company, the largest organization in the world devoted entirely to the manufacture and sale of electrically propelled vehicles.

Send the coupon today.

We Want the Biggest Parts Salesman Obtainable NOW

CAN you sell axles and wire wheels? If you can, I can show you how to earn "way-up-in-five-figures." Wire wheels are assured as general equipment, just as surely as you are breathing. We are on the ground floor—pioneers in this country. All we need now is the biggest parts salesman in this country to take full charge of the sales of McCue wire wheels and McCue axles.

The man we close with can make all the money he wants—he himself is his only limitation. But he must be a man who can get audiences with the real heads of industry—he must be a big man. He has a splendid position now. Here is a better one. Or perhaps he has the capabilities but a limited position. If he has the capabilities we have the position which is unlimited.

Of course, all communications will be held strictly confidential.

Don't write if you're not the big man we want. But if you're the man who can really sell in a big way we can provide the means for a fortune for you. Don't wait, show your keenness by writing at once.

C. T. McCUE, Buffalo, N. Y.

Mayo Radiators

are standard on a number of well known makes of cars—in all instances, cars in which quality predominates.

¶ Mayo Radiators offer a maximum of radiating service and are immune to leakage except in case of accident.

¶ We have been building these radiators for years and we offer them as models of correct design and construction.

¶ Every radiator is guaranteed to live up to the requirements set for it and we stand back of this guarantee.

¶ Let us give you some facts concerning the system and its application.

¶ The Overland Model 69T offers real value for your money. And when we say "value" we mean just that—a greater amount of real worth and a higher percentage of efficiency than were ever before offered for less than $1000. Look the car over. Compare it, critically, with others costing up to $1200. Then you will be convinced of the truth of this statement. You will realize more fully, too, what a factory capable of large output—40,000 cars this year—means, in the way of economy, to the automobile user. Our 1913 catalogue will tell you more fully of this car. Please address Dept. 50.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, October 3, 1912 No. 2

USED CAR PROBLEM IS UPPERMOST AT SALES MANAGERS' CONVENTION

Not Listed as a Topic But Too Serious To Be Avoided—Keen Discussion of Many Other Matters of Vital Interest to Manufacturers and Dealers Marks the Two Days' Proceedings.

Used cars cropped up repeatedly during the sales managers' convention, held under the auspices of the Automobile Board of Trade in its New York offices on Monday and Tuesday last. The used car did not constitute a fixed topic for discussion but its baneful influence is such that talk of it simply could not be avoided. Its effect on almost every part of the business was freely admitted.

Of course, no solution was agreed on. Apparently the idea which met with most accord was contained in a suggestion that no cars be taken in trade by dealers, who, instead, should organize a special used car department and sell their customers' cars for the account of the respective owners. There were those who urged a co-operative "clearing house," or selling agency, for used cars, in which the dealers of each respective city should join hands, but one of the sales managers present brought out that such a scheme had been tried in Milwaukee and that it had failed. The dealers there still are paying rent for a store which was leased, but each is going his separate way and disposing of used cars according to his own lights.

The most radical suggestion was offered by J. Elmer Pratt, sales manager of the Pierce-Arrow Motor Car Co., who did not mince words in maintaining that the true solution rests in cutting down the volume of production. Much of the trouble, he said, is caused by the action of manufacturers forcing or urging dealers to stock up and take their full allotments, which policy, although it may serve to clear factories, reacts on them by leaving unsold cars in the hands of many dealers and thereby stagnating or depreciating the market in many directions, and compelling the dealers to cut prices and to engage in trading despite their own best inclination. Pratt said that the number of used cars at present in the hands of the trade is enormous, and that nothing will serve to relieve the glut but a general paring down of outputs. His hearers gasped, but none of them undertook to dispute or share his views.

(Continued on page 31.)

General Motors Abandons Two-Cycle Cars.

The manufacture of the Marquette and Elmore cars has been discontinued by the General Motors Co., which controls both plants. The Marquette factory probably will be abandoned, but the fate of the Elmore plant, in Clyde, Ohio, is yet undecided. It may be used for purposes of developing a car of another type but, at any rate, the Elmore, which was the only remaining conspicuous exponent of the two-cycle engine, as least so far as pleasure cars are concerned, will be known no more. Any necessary work pertaining to either Marquettes or Elmores will be performed in the Olds factory in Lansing, Mich.

OOSTDYKE ORGANIZES COMPANY TO ELIMINATE GEAR-SHIFT PROBLEM

Detroiter To Produce Electrical Device of a Revolutionary Character—Gears Controlled by Push Buttons on Steering Column—Long Test Indicates Practicability—Plans for Manufacture.

Hinted at before, several times attempted, but never quite realized, the "leverless car," made possible by electric control of gear shifting operations, at length has become a reality, and before many months have elapsed apparatus of the kind in all probability will be placed on the market, for already a $100,000 company, styled Oostdyke Gear Shifter Co., has been formed in Detroit for the purpose of manufacturing and marketing the device which is nothing short of revolutionary in character. Giving evidence of earnestness of purpose and in large measure of the merit of the apparatus, the president and general manager is none other than Charles A. Oostdyke, who, until he resigned to take up the active manufacture of the device, which is his own invention, was director of purchases of the General Motors Co. He already has arranged for its manufacture, and states that in three months his company will be in position to turn out from 100,000 to 200,000 of the gear shifts each year.

That the apparatus is not only practical but is surprisingly devoid of complication, was demonstrated to a Motor World man in the course of an afternoon's ride in Oosterdyke's own car, a Bergdoll, in which the usual side lever gear shifting mechanism is replaced by the new electric apparatus. Not more than five minutes were required to familiarize the Motor World man with the

Digitized by Google

mechanism, which is so easy to operate as to cause amazement.

The visible part of the device is simple in the extreme, consisting of a small keyboard attached to the steering column and containing five keys resembling typewriter keys, each key bearing an embossed letter or number. Reading from left to right the keys are marked R, N, 1, 2 and 3, respectively, for reverse, neutral, first, second and third speeds. The usual side lever is disconnected and dispensed with. When it is desired to change gears the proper button is pressed and the clutch thrown out and let in again. This is the whole gear-changing operation. The action of the device is such that the gears are always fully meshed before the clutch is let in after making a change, avoiding disagreeable chattering and banging, and of course eliminating a certain amount of wear and tear on the gear teeth.

The mechanism which acts upon the gears, and is dependent for its operation upon a set of electro magnets, is contained in a pressed steel casing, 10 inches long, 4¾ inches wide and 3 inches deep, located under the floor boards of the car. The magnets are of highly specialized design and are said to be positive in action; nevertheless, all the current required is furnished by a set of four dry cells. The current volume amounts only to 2.1 amperes.

One of the most interesting features of this extremely fascinating control system is that it can be applied to any sliding gear transmission, either progressive or selective, and is connected through the regular gear shifting rods. The inventor's car, a 30-horsepower Bergdoll, has been running for several months with the electrical control system in operation, and the hand lever disconnected. The operation of the car is reduced to steering, braking and an occasional touch of the finger on one of the keys and the foot on the clutch pedal.

The expense of the new gear shifter is said to be extremely reasonable. In some cars, it is said, it can be installed at a cost less than that of the regular hand controlling system, and in no case is the cost likely to exceed that of the hand lever and its appurtenances. Existing cars can have their control systems changed over at a moderate cost.

Creditors Act Against Penn Auto Supply.

Creditors of the Penn Auto Supply Co., of 236 North Broad street, Philadelphia, Pa., have filed a petition asking that it be adjudicated a bankrupt; the creditors charge that a payment of $311.29 to the B. F. Goodrich Co. was preferential. The claims aggregate $568.30 and there are three creditors.

INTERNAL TURMOIL LEADS TO RECEIVER FOR OHIO

Differences Between Stockholders and Officers Cause Creditor to Take Action—Reported Assets Exceed Liabilities.

Believing that the interests of the creditors were endangered by dissentions within the Ohio Motor Car Co., of Cincinnati, the Diamond Rubber Co., of Akron, on Thursday last, 26th ult., petitioned the Cincinnati company into the hands of a receiver. Edward G. Schultz, general manager of the Le Blond Machine Tool Co., was named receiver and his bond fixed at $25,000. The claim of the Diamond company is based on a note for $6,000, which was not met when it fell due on September 15th last.

The rubber company alleges in its petition that there are irreconcilable differences existing between C. F. Pratt and A. E. Schafer, respectively president and vice-president of the company, who are in active control of the business, and the rest of the stockholders, and unless harmony is restored the assets of the company will be wasted and reduced in value to the loss of its creditors.

The petition also declared that because of delay in receiving certain materials the company has been unable to fill many orders that in consequence have been canceled, with the result that the company is left with a stock of partly finished machines on hand, worth more than $200,000, which will be of little value unless they can be manufactured to completion.

According to the statement of the officers of the company, its assets amount to approximately $404,000 and its liabilities to $177,000.

The Ohio Motor Car Co., which manufactures the car of that name, is of comparatively recent origin and is the outgrowth of an extensive carriage business in which a number of its principals previously engaged.

Chalmers Carves Another "Melon."

Having foregone distribution of dividends for a period of 18 months, in order to permit of factory development, the Chalmers Motor Co., of Detroit, on Tuesday last not only resumed payment of its regular quarterly dividend of 2½ per cent. but also increased its capital stock from $3,000,000 to $5,000,000, of which increase $1,000,000 was paid to stockholders in the form of stock dividends. The other $1,000,000 was placed in the treasury for future use. The strength of the Chalmers securities was reflected on the Detroit stock exchange on Saturday last, when it was quoted at 156.

The stock distribution of Tuesday constitutes the second luscious "melon" which the Chalmers company has cut. In August, 1910, when its capitalization was increased from $300,000 to $3,000,000 and the par value of shares raised from $10 to $100, a stock dividend of 900 per cent. was declared in addition to a cash dividend of 30 per cent. on the smaller capitalization.

Polack Gets Tire Plant in Bridgeport.

On or about October 15th, the Polack Tyre & Rubber Co., of New York, which in May last succeeded the Maine corporation of the same name, will begin the manufacture of its truck tires in this country, which heretofore have been produced by the Pennsylvania Tire & Rubber Co., of Jeannette, Pa. The Polack company has closed a deal for a plant in Bridgeport, Conn., in which the necessary machinery now is being installed. The building which will be utilized formerly was occupied by the Bridgeport Copper Co. and is located on Howard avenue.

The Polack company is an outgrowth of the German industry of the same name, its president being Max Polack, who is manager of the parent concern in Waltershausen, Germany. The American interests, however, are in charge of Herman W. Polack, vice-president of the New York corporation, who conducted the negotiations with the Bridgeport Board of Trade.

Freeman to Direct Sale of Clarks.

H. M. Freeman, treasurer and manager of the Finch-Freeman Auto Co., of Indianapolis, has been appointed sales manager of the Clark Motor Car Co., or Shelbyville, Ind., which recently emerged triumphant from its financial entanglement, and which for 1913 will market a line comprising five models. While Freeman will devote a large part of his attention to his new duties, he will not wholly divorce himself from the Finch-Freeman Co., which handles the Regal and Nyberg cars in Indianapolis.

Overland Effort Now Reaches Over Sea.

Calls from abroad having justified it, and to supplement previous efforts, H. B. Harper, assistant sales manager of the Willys-Overland Co., has been despatched to Europe to broaden the export market for Overland cars. He has authority to allot territory, and before returning will visit England, France, Germany, Spain, Italy, Austria, Holland and Russia.

The White Co. is erecting an addition, 160 x 240 feet, to its plant in Cleveland. It will be completed about December 1st.

TRUCKS TO BE MARKETED ON "EASY PAYMENT" PLAN

Sales Company Formed to Handle Selden Production on Much-Mooted Basis—Will Sell Direct to Users, Too.

Sales of trucks from the factory direct to the user are not wholly new, but selling them on the installment plan, while not novel in conception, is unusual and generally is considered an undesirable practice. But despite beliefs to that effect which may exist ,the Selden truck, which is just about ready for the market, will be sold on that plan.

The sale of the truck will be conducted not by the Selden Motor Vehicle Co. itself but by the Selden Truck Sales Co., of Rochester, N. Y., which has been formed for the purpose and which, capitalized at $150,000, has been incorporated under the laws of New York. It will handle the entire output of Selden trucks. The incorporators of the sales company are George C. Gordon, William C. Barry, Jr., R. H. Salmons, Henry G. Strong and Charles H. Stearns, all of Rochester, N. Y., the first three named being officers of the Selden Motor Vehicle Co.

The exact terms of the easy payment plan which will be brought to bear have not been made public, but it is stated that in respect not only to time payments but to service which will be rendered, it will "present something entirely new and novel and will enable many other concerns to operate trucks who could not conveniently do so if obliged to buy on a cash basis."

The manufacture and sale of the Selden pleasure car will be continued under the same management as heretofore. It will remain a medium-priced model and for 1913 will include a number of improvements and refinements, and will be sold "either direct or through dealers."

Ford Reduces Prices 15 Per Cent.

Almost without warning, and while comparatively few were expecting action of the sort, the Ford Motor Co., of Detroit, on Sunday last announced a horizontal reduction of approximately 15 per cent. on all types of Ford cars, the new prices becoming effective October 1st. The torpedo roadster was reduced from $590 to $525, touring car from $690 to $600, town car from $900 to $800, and the light delivery wagon from $700 to $625.

The Ford company had guarded well its secret, and as only last month it stated that it had no "car announcement" to make, those who did not properly digest the careful wording of the statement took it to mean that Ford prices would remain unchanged. The fact that the Ford company is planning to double its output and produce at least 150,000 cars next year is given as the chief reason for the reduction, but whether or no it was so designed, there is no doubt that it will make things uncommonly interesting for some of those engaged in the manufacture of popular-priced cars.

Reclaimer to Make Tires in Lowell.

According to present plans, the Patterson Rubber Co., of Lowell, Mass., which recently was formed with $500,000 capital stock, will break ground next week for the erection of a plant in that city which, while it will produce other rubber goods, will chiefly have to do with automobile tires. The plant, is is stated, will comprise five buildings. John S. Patterson, of Providence, R. I., is president of the company, his son, James M., is vice-president, and Francis H. Appleton, of Brookline, Mass., and his son, Francis H., Jr., are, respectively, treasurer and clerk. The elder Appleton has been identified with the rubber industry for a considerable period, and at present operates a large reclaiming plant in Franklin, Mass., where his son is located. In addition to the men named, George F. Singleton, of Franklin, will be a director of the new company.

Swinehart Chooses a New President.

In the interests of harmony, and to facilitate the carrying out of plans which are in view, W. W. Wuchter, president and general manager of the Swinehart Tire & Rubber Co., of Akron, O., retired from those offices last week. He will, however, remain in the service of the company. T. F. Walsh was elected his successor. C. O. Baughman was retained as secretary and R. A. May was re-elected treasurer. Four new directors, however, entered the company. They are T. E. Bolton, of Cleveland, and A. A. Polsky, A. C. Hoff and Oliver L. Toomey, of Canal Dover, O. The directors who were re-elected are W. E. McWheldon, E. L. Mather, T. F. Walsh, R. A. May and Joseph Dangel.

New York Creditor Buys King Plant.

By order of the court, the plant of the bankrupt King Motor Car Co., of Detroit, has been sold to George N. Clark, an attorney who represents Artemus Ward, of New York, who was one of the company's heaviest creditors. The purchase price was $40,000. The plant will continue in operation and the company probably will be reorganized. In addition to disposing of the plant, the referee in bankruptcy has declared a creditors' dividend of 5 per cent.

KNOX MAKES ASSIGNMENT; MAY AVOID BANKRUPTCY

Burden Proves Too Great To Be Longer Carried by Mayo Estate—Contributing Causes of Failure —Liabilities, $1,300,000.

After having been carried for more than a year by A. N. Mayo, its treasurer, and having been sustained by his estate since the death of that gentleman early last summer, the burden having become too heavy, the Knox Automobile Co., of Springfield, Mass., on Saturday last, 28th ult., made an assignment for the benefit of its creditors to Edward O. Sutton and Harry G. Fisk, who, as trustees, will keep the plant in operation on a curtailed basis.

The estimated assets of the company as a going concern are about $2,000,000, and its liabilities, exclusive of capital stock, are about $1,300,000, of which latter amount nearly $900,000 consists of notes due the Mayo estate. The next largest creditor is the Fisk Rubber Co., to which there is owing on account about $75,000. The Mayo estate and the Fisk company consented to the assignment, the trustees, Messrs. Sutton and Fisk, being sons-in-law of the late Mr. Mayo. Sutton is secretary and assistant manager of the Knox company, and Fisk is secretary of the Fisk Rubber Co., which also largely is owned by the Mayo interests.

In addition to the amounts due the Mayo estate and the Fisk Rubber Co., Knox notes, aggregating $70,000, endorsed by Mr. Mayo, are held by banks. The remaining $270,000 of liabilities is due approximately 300 widely scattered creditors, none of whose claims, it is stated, amount to as much as $5,000. The assets include about $315,000 in real estate, $1,200,000 for finished product and stock in process of manufacture, and about $200,000 in bills receivable.

In addition to the other liabilities there is outstanding nearly $1,000,000 of capital stock, about one-half of which is made up of preferred shares, which creditors of the Knox company accepted in payment of their claims after the company made an assignment in July, 1907.

It was at that time that Mr. Mayo entered the affairs of the company. He was made the assignee, and having assisted in making the Fisk Rubber Co. a splendid property he brought the same methods to bear in reorganizing the Knox corporation. After the creditors agreed to accept preferred stock in the new company in payment of their claims, Mayo became its treasurer and served in that capacity until

Digitized by Google

the time of his death at a ripe old age.

The amount of preferred stock issued to creditors was $494,700. It was made up of 8 per cent. cumulative shares, preferred not only as to dividends but as to principal in case of liquidation, over the $500,000 common stock.

For two years after its reorganization, the Knox company made handsome profits and regularly paid dividends on its preferred shares, but thereafter the business took an unfavorable turn and it now develops that but for the ample resources of Mr. Mayo, on which he freely drew, the company must have encountered troubled waters long ago.

Before Mr. Mayo himself died, the Knox company had lost its president, Charles L. Goodhue, by death. Both offices were permitted to remain vacant, and only three months since it was stated that new capital was in prospect and the report was current that a Springfield man who has made a monumental success in the motorcycle business was contemplating entering the Knox company, and would assume the presidency. The report promptly was denied, but in doing so Sutton frankly stated that an accession of fresh capital would be welcomed.

As trustees, Messrs. Sutton and Fisk are continuing the business and by making curtailments they hope to pull through without going into bankruptcy. In their efforts to that end, it is probable that they will have the assistance of a committee of merchandise creditors, which is forming.

Lack of funds to meet current expenses was the immediate cause of the assignment, the underlying cause of which was variously explained after the reorganization of the Knox company. Following its failure in 1907 it gradually entered the "big car" class of manufacture, and also took up heavy trucks, fire apparatus and other special business vehicles and, as always, the development of that end of the industry was slow and called for large outlays of cash, which were not quickly turned over.

Enormous Increase in Engine Exports.

Compared with the record of the corresponding month of the previous year, the export of automobile engines from the United States during the month of July last increased 727 per cent. There were shipped 505 engines as against 61 during July, 1911. The respective values are $7,751 and $66,034, a gain of $58,283, which is equal to 752 per cent. The record for the month of July makes a total of 5,703 engines, which were shipped out of this country during the first seven months of the year. Their value was $642,723. As no records were kept for the corresponding period of 1911, comparison of the two periods of seven months are not possible.

TWO HENDERSON BROTHERS ONCE MORE JOIN FORCES

C. P. Leaves Cole to Assume Presidency of Henderson Company—Other Shifts Brought About by His Change of Base.

The Hendersons, C. P. and R. P., soon will be together again. After three years' service as sales manager of the Cole Motor Car Co., of Indianapolis, C. P. will lay down that work on October 25th to assume the presidency of the Henderson Motor Car Co., of the same city, in which he holds a large interest and of which R. P. is vice-president.

To make room for C. P. Henderson, the president of the Henderson company, L. Carter, will resign, but will retain active identification with the company as chairman of the board of directors, which office has been created for him. Carter, who is a Georgia banker, is a large stockholder not only in the Henderson company but in the Cole company also. R. P. Henderson will remain vice-president and general manager of the Henderson company, but under the new arrangement will devote his time exclusively to the manufacturing end of the business, while his brother, C. P., will handle the sales and administrative affairs. L. S. French will continue as secretary.

When the sales management of the Cole Motor Car Co. is relinquished by C. P. Henderson, on the 25th inst., it will be taken up by J. Frank Morrison, secretary and treasurer of the company. He will be assisted in his financial and secretarial work by John Murphy and Barton Wright. Homer McKee, the Cole advertising manager, will retain that office, and also will act as assistant to the president, J. J. Cole.

Berkshire Again Cramped for Funds.

Removal from Pittsfield, Mass., to Cambridge, in the same State, did not serve to improve the financial health of the Berkshire Motors Co. After having suffered embarrassment in Pittsfield, and undergone reorganization and a slight change of name, the Berkshire company, several months ago removed to Cambridge, where it has been producing Berkshire cars in a small way and where, only recently, it was stated a factory was being erected for its occupancy. Instead of prospering, however, it again is in straightened circumstances, D. B. Barker and James Addison, of the Boston law firm, Andler, Barker & Wood, having been appointed agents to take charge of the company's affairs. Its liabilities are estimated to be $25,000, but its book assets, at least, exceed that sum. The lawyers who are in charge are addressing the creditors with a view of solving the difficulties.

Remy Seeks to Stop Unauthorized Parts.

For one reason or another, the manufacture of spare parts of certain automobile appliances, magnetos, among others, by other than the manufacturers of the devices themselves, has reached proportions little known to the outside public. The Remy Magneto Co., of Anderson, Ind., one of those which has suffered by such "guerilla" productions, so to speak, and having been compelled unjustly to bear the blame for replacement parts for which it was not responsible, has instituted proceedings to discourage the practice. The Remy company already has obtained an injunction against the Monnier Auto Supply Co., of Detroit, restraining it from handling Remy parts, not made in the Remy factory, and has filed application for similar injunctions against the National Motor Goods Co., of St. St. Louis, the Chicago Automobile Supply House, of Chicago, and the Iroquois Rubber Co., of Buffalo.

Motor Car Imports Show Loss.

Imports of automobiles into the United States fell away to the extent of $20,490 during the month of July, the total being $175,741 as compared with $155,251 during July of 1912. France alone increased its shipments, their respective values for the Julys of 1912 and 1911 being $95,433 and $56,142. The imports by countries were:

	July, 1911.		July, 1912.	
Automobiles—	No.	Value	No.	Value
France	22	$56,142	36	$95,433
Germany	14	33,080	6	18,063
Italy	10	14,578	6	11,111
United Kingdom	10	21,469	5	8,810
Other countries	24	50,472	11	21,834
Total	80	$175,741	64	$155,251

For the seven months ending with July, 1912, the number of cars imported was 467 and their valuation was $1,082,301, while the corresponding figures for the term ending with July, 1911, were 492 and $1,067,091.

Case Now Will Build Its Own Cars.

After having built the Case car under contract for a period of some two years, the Pierce Motor Co., of Racine, Wis., finally has been acquired, lock, stock and barrel, by the J. I. Case Threshing Machine Co., of that city. Although, in a public statement, the president of the Case company, several months since stated that its undertaking had in no way committed it to automobile manufacture, it was more or less common knowledge that the acquirement of the Pierce property was in view, and that it probably would be taken over at the close of the present selling season.

The Week's Incorporations

Detroit, Mich.—Wolverine Castings Co., under Michigan laws, with $10,000 capital. Corporators—William Berg, Harry Norris, John Galen.

Greenville, S. C.—Ellis Car Co., under South Carolina laws, with $15,000 capital; to deal in motor cars. Corporators—A. G. Dale and others.

Tuscaloosa, Ala.—Oak City Garage Co., under Alabama laws, with $5,000 capital. Corporators—G. G. Brownell, Mrs. J. A. J. Brownell, W. E. Mills.

Charlotte, N. C.—United Motor Charlotte Co., under North Carolina laws, with $50,000 capital. Corporators—J. H. Ham, J. H. Ross, W. S. Boyd.

Los Angeles, Cal.—Derry Auto & Carriage Works, under California laws, with $50,000 capital. Corporators—A. A. Derry, C. F. Reinen, J. E. V. Hillier.

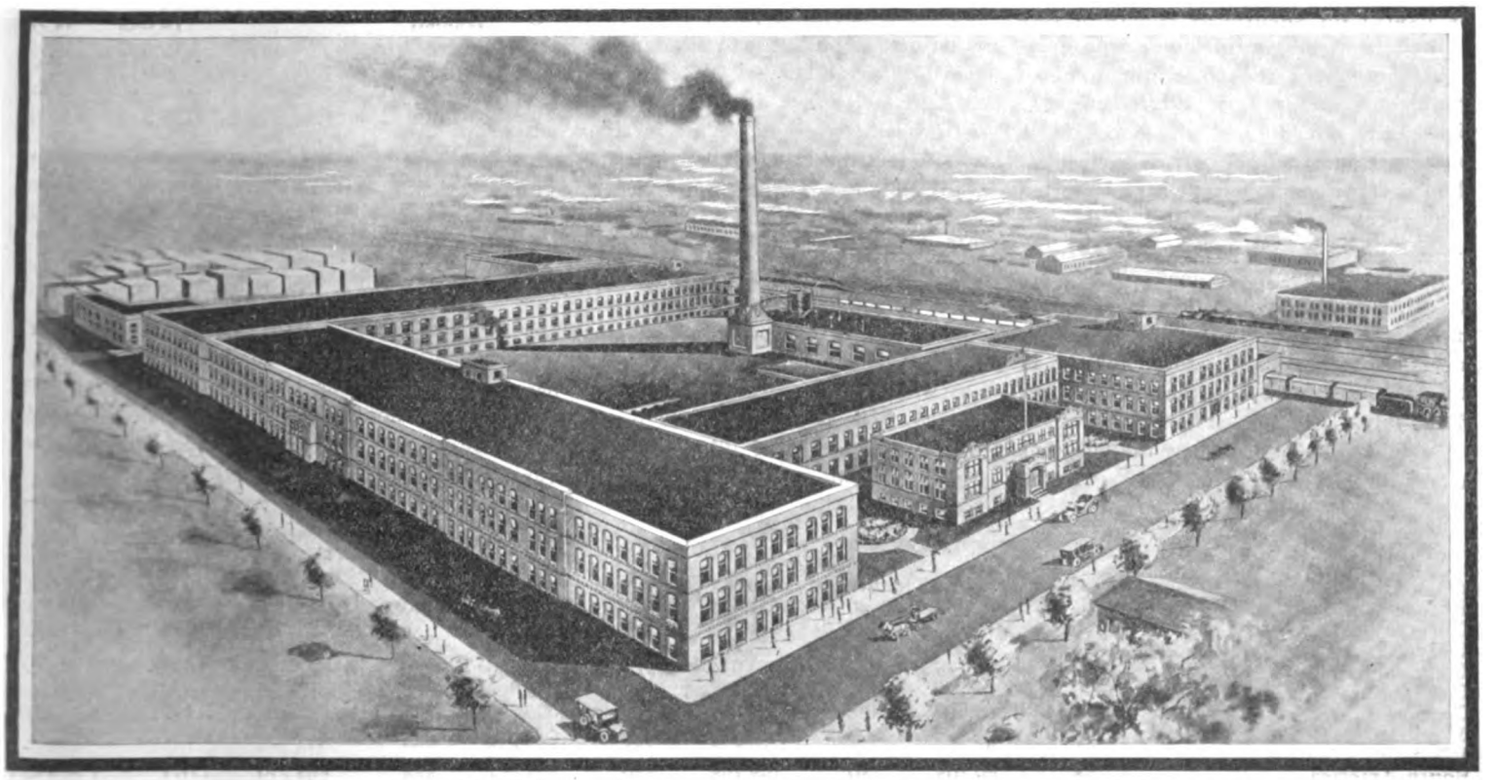
Seattle, Wash.—Ballou & Wright, under Washington laws, with $65,000 capital; to deal in motor cars. Corporators—C. F. Wright, O. B. Ballou and others.

Indianapolis, Ind.—Marion Garage & Auto Co., under Indiana laws, with $15,000 capital. Corporators—Burr Custer, Edward S. Payntor, Gilbert P. Butterworth.

Utica, N. Y.—Otis Motor Sales Co., under New York laws, with $10,000 capital. Corporators—Edward J. Otis, William T. Cantwell, T. Harvey Ferris, all of Utica, N. Y.

Chicago, Ill.—Schillo Motor Sales Co., under Illinois laws, with $15,000 capital; to deal in motor cars. Corporators—Leonard Lorimer, E. W. Schillo, Albert G. Schillo.

Camden, N. J.—Blackstone Sales Co., under New Jersey laws, with $2,500 capital; to deal in motor cars. Corporators—Clarence M. Pletcher, Ivan F. Goodrich, Fred Ihrig.



St. Louis, Mo.—Heinrich Automobile Co., under Missouri laws, with $2,500 capital; to deal in motor cars. Corporators—Valentine Heinrich, M. Heinrich, Casper Lykam.

Paterson, N. J.—Standard Auto Co., under New Jersey laws, with $2,500 capital; to deal in motor cars. Corporators—Christian Braun, William F. Drexler, Henry Stoeher.

Brooklyn, N. Y.—Q.-C. Storage Battery Co., under New York laws, with $2,000 capital; to manufacture storage batteries. Corporators—Albert Friedenberg, 38 Park Row, New York City; Albert Friedenberg, 79 Lexington avenue; Leopold Friedenberg, 36 Beaver street, New York City.

New York, N. Y.—Amazon Rubber Smoking Machine Co., under New York laws, with $5,000 capital; to manufacture rubber making machinery. Corporators—Charles T. Green, 2 Rector street; Edwin B. Griffin, 337 West 14th street; Ernest M. Morrison, 206 Lincoln avenue, Brooklyn.

MILWAUKEE PLANT THAT WILL DOUBLE OUTPUT OF KISSEL CARS

Factory at Center and 32d street, Milwaukee, Wis., acquired by Kissel Motor Car Co., in which general offices will be located and which will be operated in addition to the Kissel plant in Hartford, Wis. It provides 200,000 square feet of floor space.

EXPORTS RETAIN STRENGTH; JULY GAIN 54 PER CENT.

Canada Continues To Be Largest Buyer and Further Increases Its Purchases—Average Values Disclose Peculiar Phases.

Although the importation of American low-priced cars has caused considerable furore among English manufacturers, there are parts of the world which are seeking American cars of a higher rather than a lower price; those, according to governmental statistics, are the three American colonies, Hawaii, Porto Rico and the Philippine Islands, and the comparative imports of these geographic divisions for the Julys of 1911 and 1912 show substantial increases in the average value of the cars imported. The figures for exports of American cars to all parts of the world indicate progress in this branch of the trade, the total of cars and parts for July, 1912, being $2,305,668, and for July, 1911, $1,496,390, a monetary gain of $809,278, or 54 per cent.

The average valuations of cars imported to the three colonies were: Hawaii, 1911, $1,536; 1912, 1,789. Porto Rico, 1911, $1,500; 1912, $2,324. The Philippines, 1911, $872; 1912, $1,646. Despite the increased valuation of the total of cars sent to these American possessions the total number in July, 1912, was three less than in the preceding July. Colonial trade, however, is on the gain, as is indicated by the fact that whereas these countries took 543 cars in the first seven months of 1911, the number for the corresponding period of 1912 was 894.

Of the twelve geographic divisions into which the Federal government separates the exports, Canada, as that country has done for some time, took the largest number, 462 cars, valued at $686,889, which is an increase of 60 per cent. in number and 88 per cent. in valuation over its importations for July, 1911; also Canada's gain, $320,900, was the largest recorded among the twelve divisions. South America is next in rank in amount of gain; in July, 1912, it took cars valued at $198,798, while in that month of 1911 the valuation was $69,105, a gain of $129,693, or 19 per cent.

The United Kingdom, however, ranks next to Canada in the valuation of cars imported from the United States, the amount being $230,924. Next in order are South America, $198,798; British America, $184,034; Other Europe, $124,672, and Asia and Other Oceania, $124,086. The average value of the cars sent to the United Kingdom in July, 1911, was $957, while in July, 1912, it was $669, a decrease of $288. This is below the average for all foreign countries, which in July, 1911, paid an average of $1,078, and a year later $1,041. The average price for South America was: July, 1911, $1,439, and July, 1912, $1,104.

The first seven months of the years 1911 and 1912 indicate a growth in exportations; during the former period 8,935 cars were shipped, and during the latter, 15,195, a numerical gain of 6,260, which on a percentage basis is 70. The valuations in the first seven months of 1911 were $9,194,564, and in the same portion of the present year, $15,418,172, an increase of $6,223,606, or 67 per cent. In the summary of cars and parts to foreign countries and the three American possessions it is seen in the subjoined table that for the first seven months of 1912 cars and parts valued at $19,831,880 were exported, and for the first seven months of 1911 the value was $12,096,718, a gain of $7,735,101, or 64 per cent.

Increase in Value of Exported Tires.

The volume of tires exported to foreign countries and the American colonies by the United States continues to grow with the months, the record for the shipments during July, 1912, showing an increase of 71 per cent. over July, 1911. The money values represented were $255,313, as against $438,218, a gain of $182,905. The exports were distributed as follows:

	July 1911	July 1912
Foreign countries	$218,883	$390,236
Hawaii	18,954	35,228
Porto Rico	10,631	10,955
Philippines	6,845	1,799
Total	$255,313	$438,218

The record for the first seven months of 1911 and 1912 shows respective valuations of $1,726,637 and $2,152,755, a gain of 25 per cent. or $426,118.

Detroit Body Builder Enlarging Plant.

The Herbert Mfg. Co., of Detroit, which manufactures automobile bodies, has filed plans for a new factory building at 1123-35 Vermont avenue, in that city. It will be a one-story brick structure, 130 x 144 feet, and will cost about $45,000.

In the RETAIL WORLD

The Osceola Garage Co. is building a brick garage in Kissimmee, Fla.

George Bessenger, of Sheboygan, Wis., has sold his garage to Walter Ellinger.

B. H. Strough has commenced the construction of a garage in Glendale, Ariz.

George P. Dier plans to erect a garage in Bozeman, Mont. It will cost $10,000.

George Stagge and Forest Decker are about to open a garage in Franklin, Ohio.

The Rozell-Harris Co. has established a garage in Hackensack, N. J., on Mercer street.

Babst & Scheffler, of Barnesville, Minn., are about to build a garage; it will cost $4,000.

George Thomas has opened a new garage in Johnstown, Pa. It has a capacity for 25 cars.

Grant Kail and Vigor Larsen are remodeling a building in Lorrville, Iowa, for garage purposes.

Henry Golden, of Taunton, Mass., is building a garage at Leonard street and Presbrey avenue.

Fred St. Pierre, of Waterbury, Conn., has purchased the Woodbury (Conn.) Garage of Paul Bronson.

Maurice L. Galvin, of Covington, Ohio, has secured plans for a garage to be built on Sanford street.

J. J. Young has broken ground in Brownsville, Tex., for a new garage; its cost will be $20,000.

Trux Griffin is building a garage in Palmerton, Pa. When completed it will accommodate 48 cars.

A. Rohkam, of 1048 Oakdale avenue, Chicago, is about to build a one and one-half story garage; it will cost $7,000.

The Fort Madison (Iowa) Auto Supply & Engine Co. is about to build a two-story brick garage at Second and Cedar streets.

C. G. Bundy, of Santa Monica, Cal., has accepted plans for a garage, 75 x 116 feet; it will be built at Third and Utah avenues.

Cooper Garage is the style under which a new business is about to be opened up in New Rockford, N. D. The garage is 44 x 60 feet.

L. W. Sherlund will build a concrete garage, 50 x 100 feet, in Brainerd, Minn. The site he has secured is on South Sixth street.

The Rockingham Garage in Portsmouth, N. H., has been taken over by Dickey & Edwards; they also have secured the Hudson agency.

George H. Junod, of Athens, Ohio, has commenced the razing of a garage on Carpenter street and will build a new one; it will be 80 x 100 feet.

J. H. Cain and F. A. Oehm are about to build a one-story garage in San Francisco, at Geary street and Ninth avenue; the estimated cost is $5,000.

John N. Bleeck, of St. Louis, Mo., has secured authority to erect a two-story garage at 2914-16 North Grand avenue; the estimated cost is $15,000.

Frank C. Fickling, who is well known in the accessory trade in Washington, D. C., has opened up at 1530 14th street under the style National Auto Supply Co.

The Auto Shop is the style chosen by John Cline and Dennis Beglin for a repairing business they have established on East Second street in Plainfield, N. J.

The Moline Automobile Co., of Moline, Ill., has established a branch in Los Angeles at 1518-1522 West Washington street. It is in charge of O. J. Root.

Ira A. Fairbank, of Waterloo, Iowa, has let the contract for a garage, 60 x 100 feet, to be erected on Fifth street, west; the plans call for an expenditure of $14,000.

The Darford Motor Co. is about to build a garage, 100 x 84 feet, at Central avenue and Hudson street, Newark, N. J. The plans call for an expenditure of $25,000.

Permission has been granted to Robert H. Fowler to erect a two-story garage at 500 West Pico street, Los Angeles, Cal. He will expend $12,000 on the building.

Permission has been granted to Oscar Harris, Martin White and others, in Paterson, N. J., to erect a brick garage at 725-27 Madison avenue; its cost will be $2,500.

Edward Dale and F. M. Buffehr, of Tonopah, Cal., have bought the Boulevard Garage, in Glendale, in the same State; the new owners already have taken possession.

Robert Herrick and John McDonald, of Marshfield, Wis., have purchased the Hughes Garage from Orrin R. Hughes; the style has been changed to Hub City Auto Co.

Plans are being prepared for a garage to be erected by Dow & Green, on Taylor street, near Geary street, San Francisco; estimates of the work indicate a cost of $35,000.

The Cadillac Automobile Co., of Brooklyn, N. Y., has bought property at 3, 5 and 7 Lafayette avenue, and will erect a sales and repair building; $100,000 will be expended.

Architects are preparing plans for a garage which Rufus H. Brown, of Brooklyn, N. Y., is to build at Ocean avenue and Avenue L; it will be two stories, of brick, and will cost $8,500.

Charles W. Keniston, of Hawarden, Iowa, has sold his automobile and implement agency to Steele & Metcalf; the latter concern is in the same business and now will broaden its field.

The stable connected with the Central Police Station at Canal and Haymarket streets, Providence, R. I., has been transformed into a Municipal Garage; the city owns seven or eight cars.

Isaac Kempner, Irving S. Hirsch, Harry M. Westcott and Asa Gracie have organized the Westcott Motor Truck Co. in Little Rock, Ark. The company will operate a transfer business.

Permission has been granted to Coerper Bros., of Milwaukee, Wis., to erect a concrete garage, 60 x 120 feet, on Grand avenue, between 27th and 28th streets; it will represent an expenditure of $12,000.

Oscar Werner has sold the Los Angeles Simplex agency to George A. Bental, of the Coleman & Bental Co. The latter concern now has the entire Pacific Coast agency for Simplex and Mercer cars.

George Tolman, who is well known to the trade in Boston, Mass., has entered the used car field in that city under the style Massachusetts Auto Clearance House; he is located at 108-10 Massachusetts avenue.

The Reo business in Cleveland, Ohio, has been taken over by Henry J. Adams, who for a number of years has been a Reo sales organizer in northwestern Ohio; the factory branch in Cleveland has been discontinued.

Digitized by Google

F. W. Winbolt, garage operator in Princeton, Ill., has been thrown into bankruptcy; his assets are $3,500 and his liabilities $4,000. He gives as the reason for his failure the unwillingness of car owners to pay living prices.

The Union Garage, which was established in Adrian, Mich., by a number of automobile owners, has been sold to M. S. Gould, who will continue the business as heretofore; Gould formerly was employed by the Lion Motor Car Co.

Fred Michaels and C. T. Boyd, of Cedar Falls, Iowa, have sold their interests in the Lawn City Garage to W. M. Lang, H. Brinkman and W. P. Rothermel, all of Oelwin, in the same State; Michaels and Boyd retain their cars and tools and will reopen in another location.

The Union Motor Car Co. is a new entry in the garage field in Washington, Pa. It will occupy the building at 442 West Chestnut street, formerly occupied by the Clutter Auto Co. Besides operating a garage, it will sell accessories and will handle Mitchell, Empire and White cars; M. C. Burchfield is manager.

William Schuh, who has been connected with the Schrup Motor Car Co. in Dubuque, Ia., as a mechanic, will enter the garage trade for himself; temporarily he will occupy the McCarthy garage at Locust and Seventh streets, but January 1 will have a new structure on Clay street between Ninth and Tenth.

W. C. Dennis and L. P. Kuttler, who operate in Rock Island, Ill., under the style Dennis-Kuttler Machine Co., have taken over the repair business of the Rock Island Auto and Tire Works at Third avenue and 34th street; W. H. Bolles retains the tire repair and supply department and remains in the old location.

The Superior Motor Car Co., has entered the trade in Middletown, Ohio, in the garage on Canal street formerly occupied by the Middletown Motor Car Co. Fred Van Sickle and Frank Crocker compose the new firm; Crocker has been connected for some time with the Weisers Motor Inn in Hamilton, in the same State.

Recent Losses by Fire.

Athens, Pa.—Athens Motor Co., garage damaged. Loss, $5,000.

Beverly, Mass.—Sprague, Breed & Brown, garage damaged. Loss, $1,000.

Belleville, N. J.—Hardman Tire and Rubber Co., factory damaged. Loss, not stated.

Richland Center, Wis.—E. B. Prouty Co., garage damaged. Loss, $10,000.

Tacoma, Wash.—W. D. C. Spike, 2511 South 14th street, garage damaged. Loss, $5,000.

SEEK DEALERS' SUPPORT FOR SALES CONVENTION

Indianapolis Bids Them Welcome and Wants Their Experiences—Subjects That Are To Be Presented by Experts.

If automobile dealers in considerable numbers are not present at the "National Salesmanship and Advertising Convention" at Indianapolis on Tuesday and Wednesday next, 8th and 9th inst., it will not be the fault of J. J. Cole, Homer McKee, D. B. William and the other promoters and planners of the undertaking. They are extending unlimited invitations to all dealers, as well as to all other tradesmen, for while a number of formal addresses will be made, it is the intention to give to the occasion the flavor of an "experience meeting" by seeking the personal experiences of most of those who will be present.

The convention will be held in the Claypool Hotel in Indianapolis and will be presided over by Walter D. Nesbit, of Chicago. The address of welcome will be made by H. O. Smith, president of the Premier Motor Mfg. Co., of Indianapolis, after which the following set of papers will be delivered:

"Headwork in Salesmanship," John G. Jones, Alexander Hamilton Institute, New York City; "The Opportunity of the Automobile Dealer," T. J. Zimmerman, Opportunity Magazine, Chicago; "Why I Thought of a National Salesmanship and Advertising Convention," J. J. Cole, president of the Cole Motor Car Co., Indianapolis; "The Co-ordination of Advertising and Sales," E. Leroy Pelletier, advertising director of the Flanders companies; "How to Use Advertising in the Retail Game," John Lee Mahin, Mahin Advertising Co., Chicago; "Ideal Salesmanship," Elbert Hubbard, East Aurora, N. Y.; "How to Get the Co-operation of Your Local Papers," B. F. Lawrence, Indianapolis Star; "Business Methods and the Motor Car," Charles A. Bookwalter, ex-mayor of Indianapolis; "How to Spend Your Advertising Appropriation," John C. Wetmore, New York Evening Mail.

Changes Among Prominent Tradesmen.

A. B. Cordner, manager of the General Motors Truck Co.'s New York branch, has resigned that office. He has been succeeded by T. P. Myers, who previously was general service manager of the General Motors truck factory in Pontiac, Mich.

William Kelly has been promoted to the superintendency of the Oakland Motor Car Co.'s plant in Pontiac, Mich. He succeeds to the vacancy caused by the death of Thomas W. Wilson, who three weeks ago was killed in an automobile accident.

H. A. Farr, manager of the Portland (Ore.) branch of the United States Tire Co., has been transferred to the management of the Seattle branch. He succeeds H. A. Jones, who has engaged as manager for Ballou & Wright, of Portland, which company handles G & J tires. C. H. Mayer, one of the United States Tire travelers attached to the San Francisco house, has been promoted to management of the Portland branch.

Garagemen Plan To Get Cheaper Gas.

Having completed organization and elected officers and directors at a meeting at Reisenweber's, Seventh avenue and West 58th street, Thursday evening, 26th ult., the New York Garage Association has commenced its activities with two primary definite objects in view; one is to secure contracts with an oil company whereby a lower wholesale rate for gasolene will be put into effect, the other is to endeavor to secure the withdrawal of a fire regulation which provides for the installation in every garage of a gasolene separator, a device placed near the door to prevent gasolene from getting into the street and which is said by the garagemen to be obnoxious and worthless. Theodore K. McCarthy, counsel for the association, was instructed to file a brief with the fire commissioner.

The officers elected are: President, L. J. Joscelyn; vice-president, William Burrows; secretary, Charles H. Potter; treasurer, George Rainey. Directors: Bronx, Herman Ellenbrock and C. A. Otten; Washington Heights, H. L. Hulse and E. D. Wright; Harlem, C. W. Kenney and Charles H. Potter; Upper West Side, G. Rainey and G. Bierman; Lower West Side, M. Segal and O. W. Lowell; East Side, J. Stafford and W. Burrows; Central, L. J. Joscelyn, and Brooklyn, J. J. Dobbins and Charles McLoughlin.

To investigate the matter of obtaining gasolene contracts a committee was appointed consisting of Charles H. Potter, William Burrows, J. Stafford and M. Nicholai. These men will report the results of their work early next week to the board of directors.

Hood Takes Over Its Shawmut Offspring.

The Shawmut Tire Co., of Boston, Mass., which was an offspring of the old-established Hood Rubber Co., of that city, has been taken over by the latter and the tire company, as such, has ceased to exist. The manufacture of the Shawmut tire will be continued, however, and it is not unlikely to be supplemented by a new one which will be styled the Hood.

NEW YORK, OCTOBER 3, 1912

GIVING REPAIRMEN A BETTER NAME.

For reasons that do not require a long-winded explanation, there is a lingering tendency on the part of motor car owners to regard a repair shop somewhat in the light of a stronghold of the enemy and to consider a business transaction with such an establishment a sort of battle in which one side or the other is worsted as a matter of course. The idea, whether definitely formed or merely a vague, perhaps sub-conscious instinct, is that the repairman always is on the alert for opportunities to make extortionate charges and that the owner perforce must also be on the alert to protect himself.

The amazing persistence with which an unfortunate experience sticks in the human memory is responsible for a very large proportion of this distrustful attitude, for though there undoubtedly are repairmen who do not hesitate to "pad" their bills, they are far less numerous than once was the case, and nine out of ten owners who can wipe from their memories recollections of former extortions and who use a little discretion in selecting repair shops, will agree that they have little to complain of at the hands of this much maligned class of mechanical experts.

There are so many shops in the business that competition has the inevitable effect on charges; there is too much repair work being done every day for the average motor car owner to be in ignorance of what constitutes fair remuneration for work, provided he takes the trouble to find out; and, what is far more important, there are as many square, upright men in the repair business as in any other branch of mechanical work. Taking everything into consideration, it seems about time that the time-honored stigma be removed from automobile repairmen as a class.

THE DIVORCE OF SPORT AND TRADE.

Abandonment of the A. A. A. national reliability tour is regrettable but not surprising. It merely is the culmination of the disinterest which has been responsible for the sadly shrunken entry lists of the past summer and for the indefinite postponement of no inconsiderable number of events, the promotion of which was undertaken in various parts of the country.

Though interested men may whistle to keep up their courage and may present varied arguments to sustain their assertions that the sport has not declined, anyone with even half an eye can see that it has diminished and diminished greatly. The truth of the matter is that the trade has wearied of participation in sport and wants little, if anything, more to do with it. It is a situation which was to have been expected.

As Motor World many times during the past several years remarked, sport and business do not mix. At best, sport is but an artificial outgrowth of business, if it is not a growth thereon. Intense interest which may be displayed when enthusiasm runs high quickly is dissipated when business sense returns to a normal state.

In forecasting the present situation, Motor World long ago pointed out that if automobile sport was to endure, amateurism must be encouraged and fostered. It was neither encouraged nor fostered, and if the only semblance of sport that remains is that form of it which is undertaken by professional promoters and engaged in by professional performers, the blame for such conditions will not be hard to place.

DISCUSS THE USED CAR PROBLEM.

Whenever men concerned with the welfare of the industry "reason together," the used car always plays a large part in their deliberations. It was almost a matter of course, therefore, that, although not listed as a topic for discussion, the used car repeatedly intruded itself on the sales managers who participated in the Board of Trade's conference on Monday and Tuesday of the present week. That the used car is the most distinct shadow, if not the only one, that overspreads the industry freely was admitted, and that anything that offers even a measure of relief will be welcomed was made equally plain.

It is certain that the greatest measure of relief is promised only by full and open discussion, such as Motor World has invited and has endeavored to stimulate by its cash offer of $50, $25, $15 and $10 for the best respective articles dealing with the subject. Several notable papers already are in hand, the first of which will be published next week. Meanwhile, there is no man in the industry who is too high, or none who is too humble whose opinions are not worth ventilating.

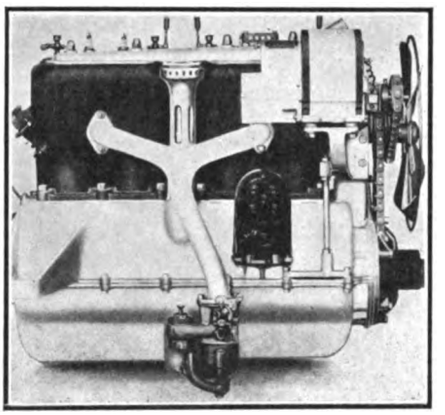
ELECTRIC VEHICLES TO BE FEATURED AT ELECTRIC SHOW

Twelve Manufacturers Booked to Make Displays in Grand Central Palace Next Week—"Stunts" to Provide Entertainment.

What may be styled a close approach to an exclusive electric vehicle show is due to be opened in New York City on Tuesday next, 8th inst. It is scheduled to follow the rubber show in Grand Central Palace, and, according to present indications, it is likely to be an even better exposition of electric transportation methods than were its predecessors of several years past.

An even dozen manufacturers of pleasure and commercial vehicles have contracted for space, and their exhibits are to be augmented by the displays of four battery manufacturers. The complete list is as follows: General Vehicle Co., General Motors Truck Co., Buffalo Electric Vehicle Co., Anderson Electric Car Co.; Lansden Co., Studebaker Automobile Co., Atlantic Vehicle Co., Baker Motor Vehicle Co., S. R. Bailey Co., Champion Electric Vehicle Co., Cleveland-Galion Co., Ward Motor Vehicle Co., Edison Storage Battery Co., Electric Storage Battery Co., Philadelphia Storage Battery Co., Gould Storage Battery Co.



Following the plan that was inaugurated last year, a miniature "track" will be laid out on the third floor, and on it the various makes of electric pleasure cars will be demonstrated. Incidentally, it is planned to carry out a program of "stunts" on the track to relieve the tedium of demonstrating and to furnish amusement for those who are not lucky enough to hold tickets which will entitle them to rides. Just what the "stunts" will be has not as yet been made plain.

Of course there will be other things besides electric vehicles, though it is doubtful if anything else will attract a greater amount of attention. The air will be virtually surcharged with electricity, and the exhibits will range in scope from just plain wires to egg beaters, and lighting apparatus and heating plants, and hosiery mills and a complete tobacco plantation, including what has been styled the world's smallest cigarette factory. Also there will be a government exhibit, in charge of "jackies" from the Brooklyn Navy Yard, showing the construction of the Gatun dam in the Panama Canal and the operation of the huge piece of mechanism under the gentle persuasion of electricity. The exhibition is styled the New York Electrical Exposition and Automobile Show, and will hold forth for just 10 days, the doors of the big palace being formally closed on the 19th inst.

Little Known Features of Well Known Cars

Magneto location on Marion engines, that is to say, the new location which has been adopted as standard practice for the newer series of Marion cars that now is coming through the factory, exhibits no little ingenuity on the part of the engineers who are responsible for the innovation and at the same time effectually disposes of several of the problems inherent in painstaking design.

Though there is little novelty in placing the magneto—it is a Splitdorf instrument—transversely to the crankshaft, such practice being fairly common among the products of a number of well known manufacturers, Marion engineers have carried the idea a little further and have placed the instrument nearer the center of the engine where it occupies a more protected position and where accessibility is more pronounced. Not merely incidentally, the position of the instrument places the breaker box and the wiring connections where they may be reached for adjustment instantly and easily.

MARION MAGNETO LOCATION

The actuating mechanism of the magneto is a worm and wheel drive, which by reason of its efficient and silent action is peculiarly fitted for such work. The worm is fastened directly to the crankshaft of the engine, thus obviating the necessity for disturbing the magneto timing in the event that it becomes necessary to take down the camshaft train of gears. Another excellent feature is that the worm gearing is effectually lubricated by splash from the crankcase compartment, and, by reason of the short driving shaft which is possible, danger of damage from twisting strains is reduced to a point where it is practically negligible.

October 3, Milwaukee, Wis.—Pabst and Wisconsin trophy road races, promoted by the Milwaukee Automobile Dealers' Association.

October 4-5, Sioux City, Ia.—Track races under the auspices of the Sioux City Automobile Club.

October 4-6, Peoria, Ill.—Track races under the auspices of the National Implement Co.

October 5, St. Louis, Mo.—Annual reliability run of the Automobile Club of St. Louis.

October 5, Brooklyn, N. Y.—100-mile consistency run of the Long Island Automobile Club.

October 5, Milwaukee, Wis.—Grand Prize road race, promoted by the Milwaukee Automobile Dealers' Association.

October 7-12, St. Louis, Mo.—Outdoor show in Forest Highlands Park, under the auspices of the St. Louis Automobile Manufacturers and Dealers' Association.

October 12, Providence, R. I.—Track races under the auspices of E. O. Hustudt.

October 12, Salem, N. H.—Road races on the Rockingham Park course under the auspices of the Salem Automobile Club.

October 12, Springfield, Ill.—Track races promoted by the Illinois State Board of Agriculture.

October 12, Salem, N. H.—Track races promoted by the Rockingham Park Automobile Club.

October 21, Chicago, Ill.—Chicago Motor Club's reliability tour around Lake Michigan.

October 21-25, Chicago, Ill.—Chicago Motor Club's reliability run.

November 8-16, London, England—Society of Motor Manufacturers and Traders' annual show in Olympia Hall.

December 7-22, Paris, France—Paris Salon.

January 11-18, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Pleasure cars only.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Pleasure cars only.

CHANGES WROUGHT BY "FORCING THE SEASON"

Fall Trade Now Better Than Spring Demand, But Failure to Receive "Early" Models Plays Havoc With Dealers' Prospects—Close-to-the-People Salesman Illuminates Situation and Shows Why Rural Demand Must Be Met in the Fall.

"What's the matter?" said the dejected appearing salesman, repeating the inquiry of a Motor World man. "We're 'up against it;' that's what's the matter. The factory has just informed us that it can deliver none of the new models for at least a month, and I suppose that means two months. We are out of it for the rest of this year. Spring sales? Fiddlesticks! It's the fall sales that count nowadays, but if many of the big moguls in the factories realize the fact they have queer ways of showing it.

It's the Fall Sales That Count.

'Yes, I mean exactly what I say; it's the fall sales that count, by which I mean that more sales are made in the fall than are made during any other season of the year. Last fall we sold thirty odd cars as against twenty odd during the spring months, and the way we now are situated our fall trade has been wholly lost. The man with the goods to deliver is the man who will get the orders."

The salesman who gave voice to these expressions is no myth; he is a bright, capable man attached to an automobile establishment which handles a fairly well-known car in a considerable and desirable portion of New York State. He is no floor salesman, either; his business is to go out among the people and not merely follow up inquiries but actually to create prospects.

Close-to-the-People Viewpoint.

In addition to a fixed salary, he draws also a modest commission on each sale that is made, which acts as an incentive to keep him constantly circulating. His travels take him into all sorts of places and, naturally, require that he meet all sorts of people at all sorts of times. His viewpoint, therefore, is a close-to-the-people viewpoint and one into which theory does not enter.

"Yes, sir," he repeated with emphasis; "the trade has changed and the factory that is not able to supply cars during the early fall months simply is turning money from its doors and making business for its rivals; for when men are in the humor of buying, and have the money to pay for automobiles, the good talker who gets close and who delivers cars to them is the man who will get their cash.

Prospects Grow Weary of Excuses.

"Of course, factory salesmen who visit dealers only ,and the heads of factories who deal only with executive affairs, glibly will make believe that it is possible for any good salesman to hold his prospects in line and keep them waiting from week to week, or from month to month, until a new model appears, but I know better. They get weary of excuses and delays. I have spent nearly five years in actually creating buyers, and I think I ought to know. It may be true of city people, but it is not true of those in the rural districts. It is during the fall months that the latter have money in pocket and that is the only time when most people buy automobiles, or seriously think of buying them.

Why Few Farmers Buy During Spring.

"If you stop to think of it," said the salesman as he warmed to his subject, "you will realize that what I say is perfectly logical. In the early spring, most of the farmers and other agriculturalists who are likely to purchase automobiles, lay out two, three or four thousand dollars for fertilizer alone, and, after the crop is planted, he's a wonderful salesman who can induce them to purchase a car until the plants are well above ground. It is almost a waste of time to 'talk automobiles' to them until the crops are green, and then the salesman's work usually is largely missionary work.

Farmer Cannot Forecast His Yield.

"Although his crops are growing, the farmer never is able to tell how things will turn out or how great will be his yield until the summer practically has spent itself. Only this summer, during a dry spell, several such prospects would give me no real encouragement until rain fell, and they knew their crops were safe. They then became real prospects, but they did not have the money until the early fall, when their crops had been gathered and paid for, and now I cannot realize on all my missionary work because the factory cannot deliver cars.

"Oh, yes, I know that the popular notion prevails that farmers, and other people who live in rural districts, are 'rubes' and, therefore, do not know the difference between an old model and a new one, but it is about time that that notion was blown to flinders. There's nothing in it, and the man in the factory who entertains the notion is simply fooling himself. The man in the country is just as intelligent and as discriminating as the man in the city, if not more so. He will ask more questions and go deeper into details, and when he proposes to spend money for an automobile there's no use trying to deceive him. It never pays in the long run, any way. He wants the latest model, and he will have no other; he knows that they are supposed to be ripe along about August, and if he cannot get a new model in September or early October he becomes a poor prospect, because, as I have stated, in the springtime his mind is full of crops and how they are likely to turn out.

Others Whose Money Comes in Autumn.

"The farmer is not the only man in the country whose thoughts of automobiles are strongest in the early fall. When he has money the store keepers with whom he trades have more money; and there is another numerous class, the country hotel keepers, particularly in the summer resort regions—and there are tens of thousands of them—who constitute good material to be cultivated by the automobile salesman who follows my line of work in going out among the people. It is at the end of the vacation season that these hotel proprietors know where they stand, and how much money they have made, and it is then that they are most disposed to buy automobiles.

Effect of Makers "Forcing the Season."

"Perhaps when they began 'forcing the season' and bringing out next year's models during July and August, instead of February and March, the automobile manufacturer did not realize what the effect would be, but the effect is exactly as I have stated it. Possibly the now overwhelming tendency to wipe out the 'annual model' feature of the business is born of sudden realization of what has come to pass; but, take it from me, it will be more than a year or two before either the 'rubes' or city folk can be brought to see the difference."

KEEPING AN ADEQUATE AND RELIABLE SHOP ORDER RECORD.

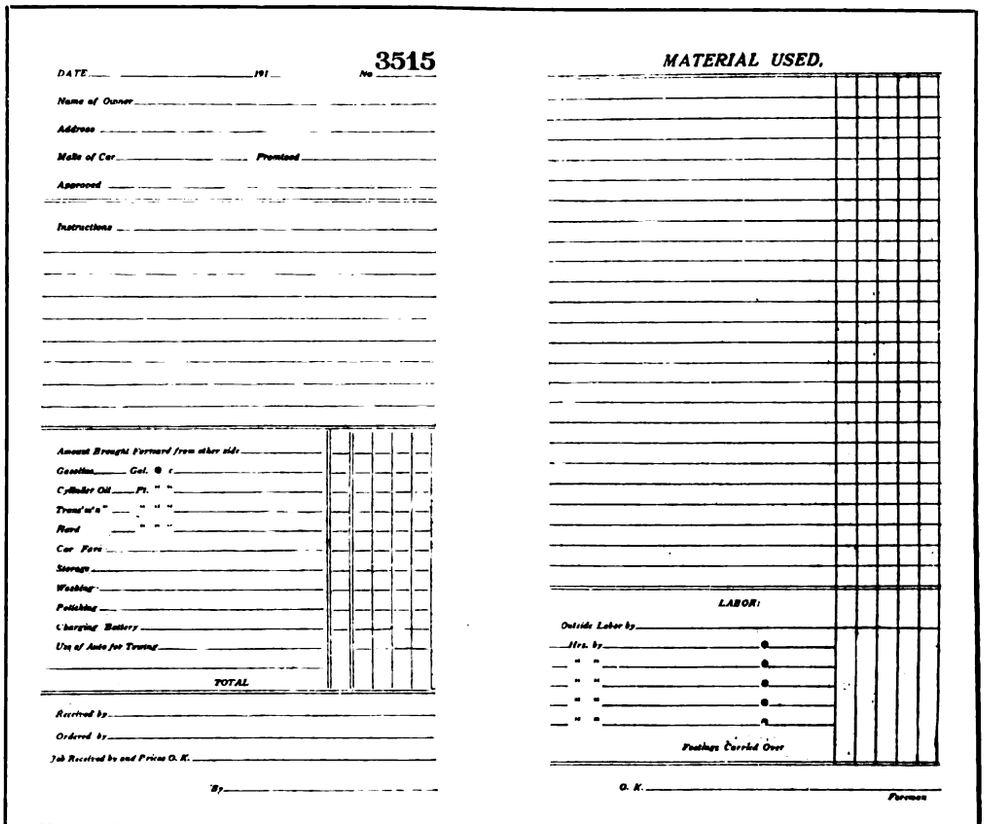
The Neuman-Lane Co., 1240-1252 Woodward avenue, Detroit, which sells Pierce-Arrow, Chalmers, and Rauch & Lang electrics, has evolved a shop order system that is not only complete but easy to handle. It provides for every contingency including repairs. It gives what Harrington Emerson, the "efficiency expert," terms a "complete, reliable, adequate and immediate" record of every transaction.

Cards Made Out in Triplicate.

This order is made out by the repair man who has a desk in the garage where all cars enter. It is made out in triplicate, white for the office, yellow for the garage, where all washing and polishing is done, and sales of oil, gasolene and accessories are made, and on thicker stock for the repair department foreman. The repair department card differs from the others in that on the reverse side is a blank space for listing materials furnished and time put on the job. All cards are numbered consecutively and every card must be accounted for to the bookkeeper. At the completion of a job the repair department card and the garage card, which is kept on the desk of the garage foreman, are sent to the accounting department and these records transferred to a "Cost Card," which is used as the basis for a ledger charge. This latter card is filed under "Repair Order No."

Affords Complete Record and Check.

This gives a very complete office record for every transaction and at the same time provides a reliable check on the repair shop, garage, etc. All gasolene, oil and other sales made for cash are recorded by entry on an Egry Cash Register, and the foreman keeps the cash, making an accounting once at the end of each day, thus keeping the office at all times in touch with these garage details.



Keeping a "Running Inventory."

This same concern have paid much attention to the accounting end of their shop, which is one of the largest and best in the country. They keep a "running inventory." That is, their purchase ledger shows at all times what their stock of parts, materials, etc., inventories at the end of each day.

Everything that comes into the garage except oil, gasolene and complete cars is received by the "stock clerk." Tires, accessories, parts, etc., are all kept in the stock room and released only on requisition, which is numbered consecutively and shows at the same time cost of part or accessory and selling price. Everything billed out is credited in the ledger to "stock department" at net price, and everything that comes in is charged to it. The difference between debits and credits not only shows the condition of stock at all times, but the profit column shows the earnings.

How Free Replacements Are Handled.

In providing free replacements, the part replaced is charged on the requisition blank to the customer, and this requisition

Neuman-Lane Shop Order System—These cards are made out in triplicate, on white paper for office, on yellow paper for garage, on cardboard for repair department, the latter having a reverse side, "Material Used," which is O.K.'d by the foreman.

Digitized by Google

which is used to make office charges for material, bears a stamp reading "Post—Do not include on statement." Thus a complete record gets on the books and the customer is not annoyed by receiving a bill for something that perhaps he thinks ought to be free. On the other hand, the dealer is protected in case the manufacturer refuses to replace the part. If the part is billed to the customer, a rubber stamp bearing the following legend is stamped on the invoice, "Above parts have been sent to the factory for inspection. If credit is allowed, we will credit your account allowance made by manufacturer."

MAKING THE MOST OF STORE RENT AND DISPLAY SPACE.

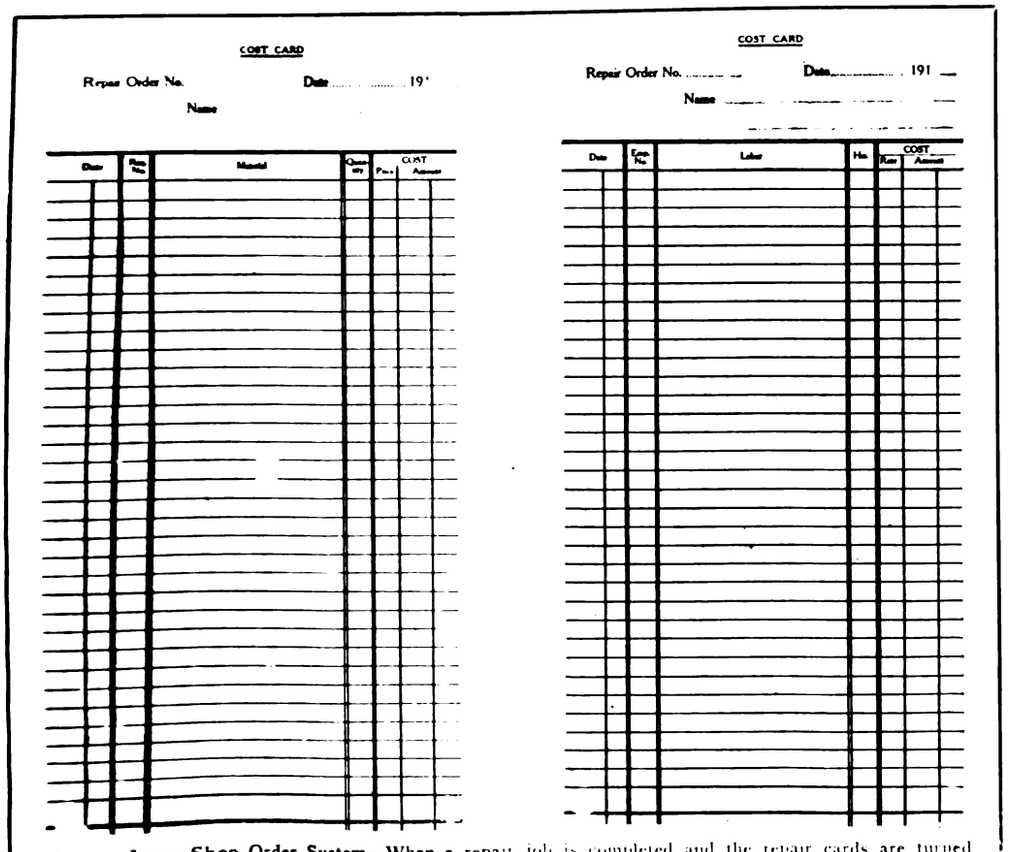
Here's a Live Wire Dealer Who Thinks and Acts.

Over the door of the private office of George Reason, manager of the Detroit branch of the Cartercar Company, 1246 Woodward avenue, Detroit, is a sign reading, "If you know more about the business than the boss, show him." That, in a nutshell, is one of the secrets of this branch store, which is one of the most successful in the country.

Warm Them Up.

George Reason has an open mind. He has ideas of his own that relate to the fundamentals of the automobile business and extend to every detail, but he is always willing and ready to be shown some better way. Even the porter feels that he can make suggestions without having cold water sprinkled over them. The result is seen in what is one of the neatest, best appointed and most business-like showrooms in the country.

Care Used in Choosing Location.



When this store and garage was erected one year ago, it was virtually in the residence district—a little too far from the business center, many thought; but it was an ideal location for a store, because across the road to the south is a flat building that stands some twenty feet back from the sidewalk, which permits the Cartercar display window to be seen from the street cars a block away. This affords street car passengers a long look at the exhibit of cars. Incidentally, it gives a much better lighted interior effect than could be otherwise secured, and there are none of the deep dark shadows that spoil so many displays.

Window Display Space a Great Asset.

"We regard our window display as one of our most important assets," said Manager Reason. "We consider it a big opportunity; we figure that a good part of the rent is based upon the fact that so many people pass our store every day—and what's the use of paying a premium for location unless you cash in on it?"

Give Each Car a Chance to Talk.

"To this end we seek to make our display as attractive and varied as possible. We never show less than three cars—never

more than five. We do not believe in crowding. The arrangement of the cars is changed at least twice a week; that is, cars are shifted around, a roadster put in front; then a touring car of a different color, with top down, then say a car with top up, and so on. We stick to automobiles; we use no live, decorative plants to collect bugs, dust and cobwebs, and it is wonderful what a variety of displays we get. When a holiday season is on we decorate the cars with plumes, etc. We take advantage of the season in our own way, just as does the window trimmer of high class dry goods stores."

Good Lighting Effects Essential.

"We studied the lighting question till we arrived at a highly satisfactory result. We use individual tungsten lights suspended a few feet from the ceiling for overhead effect, and we use the long narrow bulbs below the window sill, to throw the light from the ground up. These lights are concealed in a dark metal reflector and give the same lighting effect as the footlights on the stage.

"At night our windows are kept brilliantly lighted till 12 o'clock, when they are automatically cut off. This enables us to catch the after theatre crowds hurrying home in automobiles and street cars. The rest of the block is dark, so our bright lights focalize attention. And we think that this night display is one of our most effective results. People tell us about it. Pedestrians pause to look at the bright, cheerful, refreshing display. They not only see it but talk about it, and many of these lookers become buyers.

Light, Cleanliness, Variety Most Important Points.

"What do I consider the most important points in window display?" repeated Mr. Reason. "I should say first light; study the lighting problem and get a good light if possible day and night. Next cleanliness. That is, keep the windows scrupulously clean, and the floor spotless. We pay a window washing concern $1.50 a week to wash our windows once a week and in stormy seasons it is done oftener. We used to have the porter or washer do it, but it always was being neglected. Now we always can depend upon having our windows washed, and properly washed, too, sharp on time every week.

Where cars are in operation the vapors gather on the windows and form a haze—and even though doors between showroom and garage are kept shut we get a little of it. But, some of the windows of automobile show rooms on this very street can hardly be seen through. Lastly, I believe in continuous changing of displays; our cars move out—we sell from our window display, which is also our show room."

Garage Section Stores 35 Cars.

This same idea of neatness and cleanliness and order extends to the Cartercar garage section, where 35 cars are stored every night, and it is highly impressive—floors are kept free from grease and dirt. A uniform rental of $10 a month is charged for storage space. A tariff of gasolene and oil prices is posted near the entrance door. Washing is priced $1, polish 50c. extra, etc. Charge for washing is increased to $2 if the car is extremely dirty.

Separate Repair Department.

"I am a firm believer in separating the repair department from the main garage," said Reason. "If possible, I would have it located in a separate building. As we are situated, that is out of the question, so as you see we have walled it off and all repair work is done behind closed doors. There is no one to interfere with our repair men, and they are not called upon to serve customers with gasolene, oil, etc., as in most other garages; you can readily imagine how much better results we get."

Every Repair Job Handled in Order—"Next."

"The most embarrassing feature of automobile repair work is that everybody wants their work done right away—they can't wait—can't go without their car. This used to jumble up the shop so badly that we not only lost money in that department but we couldn't do the work as well as we wanted to. We thought it over and resolved to adopt the 'barber shop' system and stick to it. When a man goes into a barber shop and all chairs are occupied, he awaits his turn; and when a customer brings his car in we tell him when we can take care of his work, and he can either bring it back or leave it. The rule is that work on hand must be done first. It was hard at the beginning, but a few words explaining why the system was necessary and how it worked to the good of all, leaves a pleasant taste in the customer's mind and lets him see that we are running our business on a business basis that is best for all concerned."

Sold 200 Cars in 1912 Season.

George Reason is practical in his methods. He has certain ideals of clean-cut business that are carried out every day. That his methods are successful is evidenced by the sale of 200 cars between July 31st, 1911, and July 31st, 1912. His territory consists of Detroit and five adjacent counties. His customers appreciate and speak of his frankness, his simple integrity. They swear by him. They tell their friends about the businesslike way in which things are done, and his business is growing.

Service Binds Your Customer to You.

He sticks by the garage and personally inspects every new car that goes out. He is always on the job—and when you want something done he is there to do it. He believes in advertising and advertises. He is a careful but judicious buyer of space. There is nothing about his methods that can't be duplicated by any dealer. His show room is not extravagant, but has been carefully studied out—and everything is clean and in good taste. It is a genuine treat for anyone who is interested to visit his store.

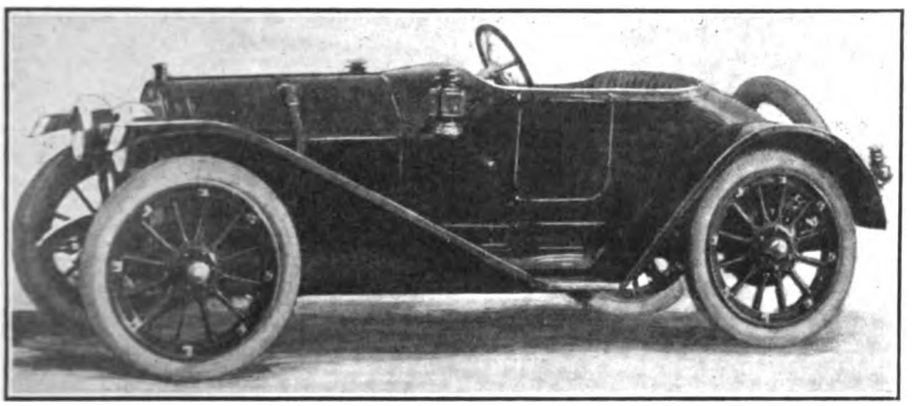
Gasolene Sales That Promote Can-Openers.

Whatever may be the disadvantage of purchasing "petrol" in two-gallon cans, the system has at least one noteworthy advantage in that it provides a simple and sure method of carrying a spare supply of fuel for use in case of emergency. It is in England that the practice of supplying fuel in sealed tins prevails, and a branch of the accessory business that has reached to no inconsiderable proportions revolves around the sale of can-holders and can-openers. There are several makes of combined can-holders and openers on the market, and the list of such devices constantly is being added to. It is a fairly general practice when starting on an extended journey to fill the gasolene tank and then to carry one of more extra tins of fuel in a patent holder on the running board.

Where Not to Use Cotton Waste.

Cotton waste is rather a dangerous material to use in cleaning certain parts of a gasolene motor, for the reason that threads and scraps are apt to become detached and lodge, unseen, in places where they can cause trouble. Wiping off the exterior of the motor with waste is quite safe, for little or no harm can result even if bits of the material come off; but for the inside of the crankcase, or any place where there are small oil or gasolene passages, a piece of cloth should be employed in preference to waste.

Evidence That Exhaust Gas Is Hot.



A good idea of the torridity of the exhaust coming from a gasolene motor is given by the fact that a valve chamber cap, from which the gasket was blown out, was packed with thin sheet lead in the hope that it would last for half a mile or so, and the lead blew out in a spray of melted metal before the motor had made half a hundred revolutions.

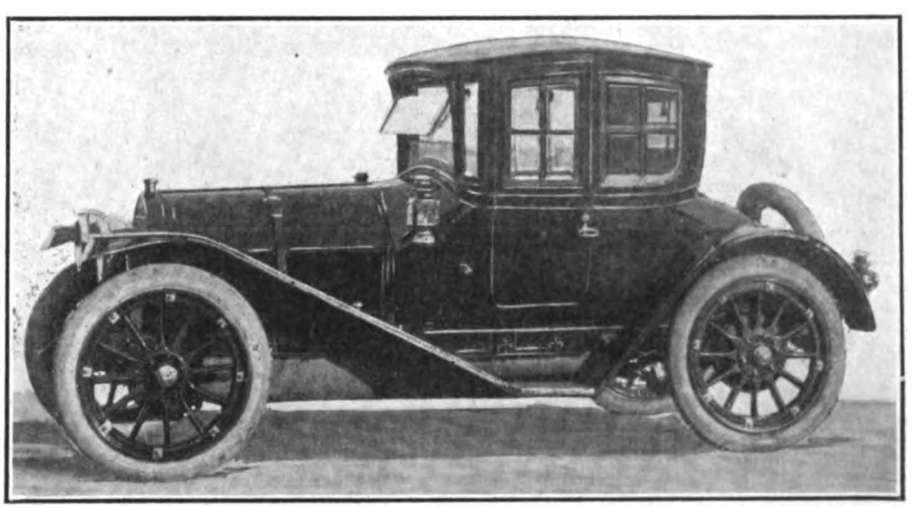
CLEVER COMBINATION BODY ADDED TO KLINE LINE

Coupe-Roadster, Built to Order Heretofore, Now Stock Model—Dynamo Electric Lighting System and Mechanical Starters.

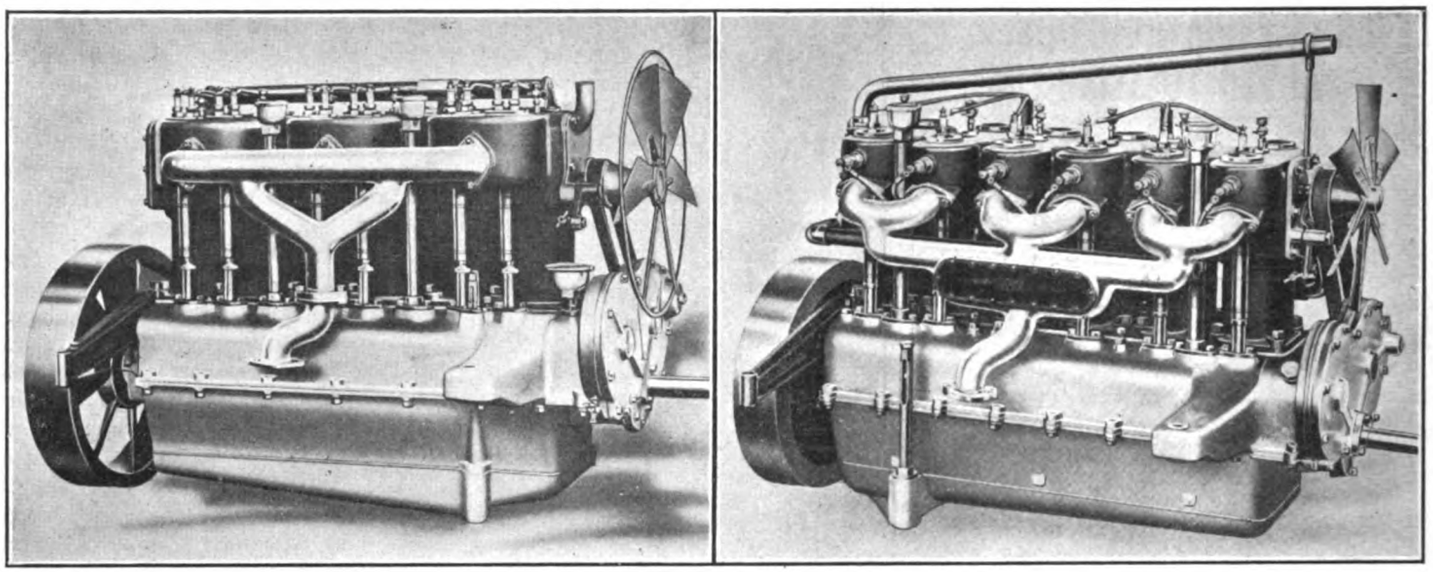


Four distinct chassis models, as heretofore, will constitute the line of the Kline Motor Car Corporation, of York, Pa., and Richmond, Va., and though bearing marked resemblance to their immediate predecessors in the concrete, they exhibit many specific betterments calculated in particular to increase the comfort of passengers. One new body style, brought out late last year, has been added to the line—it is a clever combination or convertible coupe-roadster which almost in the twinkling of an eye may be either one or the other, and be an uncommonly good-looking creation in either form—and on all four models, the "4-30," the "4-40," the "6-50" and the "6-60," a complete electric lighting system has been added and assumes the importance in the matter of added equipment which so many other manufacturers are according it.

KLINE COMBINATION COUPE-ROADSTER WITH TOP REMOVED

All of the cars, including the "4-30," which is the "baby" of the line, are started from the driver's seat as a matter of course. On the three larger models, and on the "4-30," which sells for $1,850, an Ever Ready mechanical starter forms a part of the standard equipment. On the "4-30" model, which sells for $1,750, option is given on either the Ever Ready starter, which, if chosen, increases the price a little, or the Prest-O-Lite acetylene starter, which is furnished without extra cost. In common with so many other well-known brands of cars, Kline cars no longer will be distinguished as yearly models, but instead will bear a simple series letter; the present line is designated series "A."

In designing the combination coupe-roadster, it has been the object of the manufacturers to evolve a type of body which can be used with equal comfort for both summer and winter touring, and to this end the top portion of the body is made readily detachable. Seven bolts hold it in place, and despite the fact that it may be removed in scarcely more than 10 minutes, leaving an attractive high-sided open roadster, the construction is such that the dividing line is practically indiscernible and the whole, when securely fastened together, is rattle-proof. With the top in place—it has been made four inches longer than in the original plans in order to afford more room for the occupants—the car affords comforts for winter or wet weather touring that cannot be obtained otherwise. One of the noteworthy features is that the back of the seat is arranged to move forward, revealing a large locker, which may be utilized for the storage of luggage. Needless to add, equipment is complete and includes a large electric dome light, cigar lighter and the other fixtures which generally find place in a limousine body. Owing to the construction, only finished parts are exposed when the coupe top is removed, the metal being nickel plated and the lamps and other metal work which is not finished bright being black enameled. The combination body is supplied on either of the three larger chassis.



WITH THE TOP IN PLACE, SHOWING ENCLOSED CONSTRUCTION

As regards the mechanical construction of the four models in the line, little or no alteration worthy of note has been made. Such changes as have been made have to do chiefly with the equipment, which, as already noted, has been amplified by the addition of a complete Rushmore electric lighting system. The lamp equipment which goes with the system is a little more complete than is general, the principal difference lying in the adoption of 25 candle-power head lamps instead of the lower power lamps which generally are used. The side lamps are set in flush with the dash, lending an air of smoothness to the exterior, which is otherwise unencumbered with obstructions. A dash lamp to illuminate the gauges and dash fixtures is included.

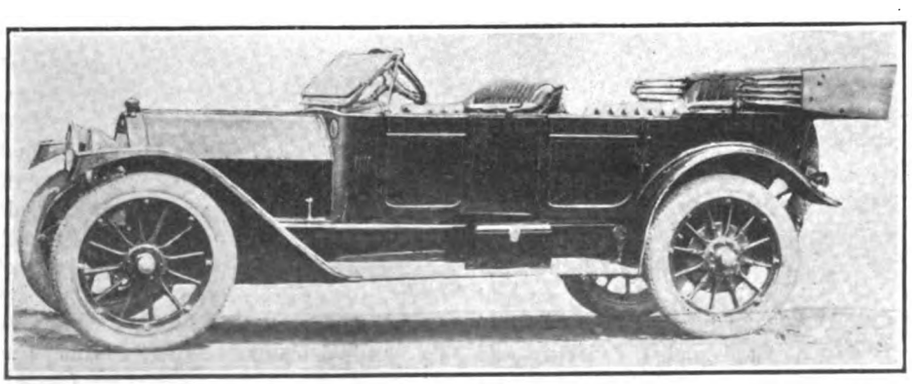
By way of obtaining the easiest possible riding, the seat cushions have been increased in depth to 10 inches and the back cushions are fitted with what are styled Turkish springs. Another feature which adds to the easy riding qualities of the cars lies in the adoption of supplementary shock absorbing springs which come into action when the car is loaded to its capacity. Ordinarily, the usual spring suspension, which is the same in all models and embraces semi-elliptic members in front and three-quarter elliptic members in the rear, provides smooth riding when a light load is carried, the auxiliary devices coming into play when an exceptionally rough piece of road is encountered or the full complement of passengers is carried.

Except for a difference in the size of chassis parts commensurate with the difference in power of the engines, the four chassis in the line are very nearly alike, the cardinal features being the same in all. In the "4-30" model, which, as its name

Digitized by Google

INTAKE SIDES OF KLINE "6-60" AND "6-50" MOTORS, SHOWING MANIFOLD CONSTRUCTION

signifies, is rated at 30 horsepower, the engine cylinders are cast separately, the bore and stroke being 4 inches and 4⅝ inches, respectively. The motors in the other three models all have their cylinders cast in pairs, the pairs in each case being securely bolted to the crankcase in such a manner that a virtual block construction is obtained. The construction has the advantage, however, that with the pairs slightly separated room is provided for main bearings between the cylinders. All three of the motors are of the T-head type, with carefully enclosed and interchangeable valves. In the "4-40" and the "6-60" engines, the bore and stroke are the same, namely, 4¼ x 5½ inches, the ratio therefore being such as to leave little doubt regarding aptness of the designation long-stroke In the "6-50" engine the bore and stroke are 4 5/32 and 5 inches, respectively, and except for these differences in dimensions the engines are practically identical in design and construction. In each case, cooling is by water, circulated by pump, and ignition is effected by means of a high tension magneto with a separate battery system for use in starting and in case of emergency. The lubrication system is entirely automatic in action, and is of the constant level force feed type in which the oil is forced from a crankcase compartment through a sight feed glass on the dash and thence into troughs beneath the connecting rod big end bearings.



The slight changes which have been made in the engine design, and which are concerned chiefly with a smoothing down and a general refinement which scarcely is noticeable, are seven slighter in the case of the transmission elements. As heretofore, the clutches remain of the cone variety, in which a liberal number of cork inserts ensures against slipping and at the same time makes for smooth action. The change gear mechanism in each case, even to the smallest car in the line, provides four speeds forward and reverse, direct drive being the third speed and the fourth speed being an overstep. A slight change has been made in the method of treating the gears, which now are constructed of a special alloy steel and carefully heat treated. The same treatment applies also to the transmission shafts.

Coincident with the adoption of new body styles which provide considerably more room and a great deal more comfort, the wheelbases of two of the models, the "4-30" and the "6-60," have been increased, the "4-30" from 114 inches to 115 inches and the "6-60" from 130 to 132 inches. Similarly, the tires of the largest model have been altered from 38 x 4½ to 37 x 5, both front and rear. The tire sizes of the other three models, the "4-30," the "4-40" and the "6-50" are 34 x 4, 36 x 4 and 36 x 4½, respectively, the same size being used both front and rear. All are mounted on Firestone quick-detachable-demountable rims.

The largest car in the line is furnished in three body styles, the price, which is $3,500, being the same for either type of body, viz., four, six or seven-passenger The price covers complete equipment, as a matter of course, and includes semi-Duquesne silk mohair top with side curtains and dust hood, adjustable glass windshield, improved tire irons, demountable rims, Rushmore electric lighting system with a full complement of lamps, Ever Ready mechanical starter, speedometer, foot and robe rails and the usual assortment of tools, spare parts, etc.

The "6-50" model, which lists at $2,850, is equipped with four-passenger, small tonneau and five-passenger touring bodies, the price including the same equipment as is listed for the larger model. Both the "4-30" and the "4-40" are furnished as two- four and five-passenger cars, the former listing at $1,850, with the Ever Ready starter, and $1,750 with the Prest-O-Lite starter, and the latter listing at $2,600, the equipment being the same in both cases and similar to that listed for the larger models.

In addition to the models already listed, there are two others which are styled "Meteor," and are designed, as their name indicates, primarily as speed creations. By reason of a slightly higher gear ratio and generally lighter body construction, only two seats being provided, either is capable of speeds up to 70 miles an hour. The Meteor is supplied in both the "6-50" and the "6-60" models, the former listing at $2,800 and the latter at $3,200.

TRANSFORMING A $50,000 LOSS INTO A SNUG PROFIT

Being the True Story of a Man Who Took Over a Business That Was Losing Money and Who by Injecting New Methods Placed It on Its Feet and Made It Pay—The Used Car as One of the Stumbling Blocks That Postpones Success—Fallacy of the False Sales Sheet.

Converting losses into profits is one of the most difficult tasks to which man can be set, or to which he can set himself; failure is more often his portion than is success. When he succeeds, he deserves all the glory and profit that may come to him, and the methods by which he achieves success become in the nature of instruction which is almost beyond value.

In the automobile trade, as in all other trades, there have been men who surmounted the difficult task. One of them who only recently attained that great glory is located in a city of considerable proportions in which the sale of automobiles is extensive but widely distributed. When the opportunity presented itself, and though the business in question—a business which is really retail but which includes a restricted circle of suburban territory—he grasped it, despite the fact that the former owner already had lost $50,000 in the venture and was adding to the loss each day. The car which he represented is well known and well established, and has enjoyed profitable sale over a considerable period of years.

Retrieving the Loss a Stern Task.

As the magnitude of the loss indicates, the rebuilding of the business and the task of converting the loss into a profit was a stern one, and, though successfully accomplished, the dealer who performed the achievement is in no wise boastful. When the Motor World sought him out he was loath to talk, not that he was averse to disclosing his methods, but because he appeared to think that he had accomplished nothing particularly wonderful. When pressed, however, his tongue loosened and he told a story which cannot fail to convey instruction to all who are not above desiring it.

For obvious reasons, his name, and the name of his predecessor, cannot be given. For the purpose of this narrative, he shall be known as Taylor and his predecessor as Martin, neither of which, however, are even mildly suggestive of their correct cognomens.

"Possibly my faith in the car has something to do with why I have been able to sell them," said Taylor when he was induced to talk of his achievement, "but, anyhow, suffice it to say they are selling now in my town; and since I am running the business I naturally feel inclined to take some credit. Before I ran this business there were cars sold here, but regardless of sales or anything else the business failed to pay. Why it didn't and why it does now are things I will explain.

Common Sense the Real Factor.

"Of course the real reason at the bottom of the whole thing is business sense; which is more or less of the common or garden variety. The business was established in this town some years ago by the manufacturer of the cars, who wished to make an energetic invasion of this field, and who believed that once firmly established the trade here would be a fine fat link in his selling agencies throughout the country. As a starter he did what may or may not have been the right thing. He wanted to make a respectable front, so instead of picking out a man who would put his own money into the thing and risk all responsibility for profit or loss, the manufacturer kept a couple of strings on the business. Every manufacturer who has out and out dealers has strings on the business, in that if the dealer doesn't suit he can be cut off; that clause goes in many contracts. But this manufacturer sort of stood back of the business and got a man to run it as a kind of a half dealer. The manufacturer told the agent that he would help him push the line, and that he would stand back of him financially to a certain extent. It looked good to the agent, because he saw less of a chance to lose than if he set up for himself and assumed all responsibility.

Lack of Effort Retarded Business.

"Well, things started. A good location was secured on a prominent street in 'automobile row' and the agency opened up. Things went fair for a time, and the agent should have made money. The main thing that ailed him was that he did not have to dig as hard as he might have. He knew he did not stand to lose heavily if sales did not come so very fast, and he had a much different feeling than he would have had had he been working out and out for himself. Hard work and the right kind at the start ought to have laid a foundation for the future. One trouble was the agent, who liked to consider himself the head of a business and to play the peacock at times; he put too much gravel and too little cement in his cellar wall; therefore he never was able to build a very big house.

No Profit in Paper Sales.

"What any sensible man should avoid was one of the inexplicable things this man did; he tried to make a good looking sales sheet when there was not enough to back it up. He wanted to send records to the factory showing the number of cars he had placed in his territory and to make it appear that his establishment was getting rid of its allotment. One way he did this was by responding to the head office's cry to establish sub-agencies. The agent did establish sub-agencies. He went out into the suburbs and in some cases not far from the center of the territory he should have covered himself and placed what he was pleased to call sub-agents—'curbstone agents.'

Appointment of Worthless Sub-Agents.

"They were nothing more or less than men who lived in certain localities and who promised to try to sell cars for the agent; the agreement was, of course, that they must purchase a demonstrator. The result—these sub-agents, some dozen or fifteen in number—bought cars at a discount of some 15 per cent. and then proceeded to forget all about their being sub-agents. They got what they wanted—a car at a cut price. And every one of these men, who wanted a car so badly, should have been placed on the prospect list at the very beginning and made to buy a car at the regular list price. The figures showed that the agent, whom we will call Martin, was placing a lot of cars. Shipments were going to him regularly, but when it came to figuring up the profits, things didn't fit. The factory, which figured that it ought to make a profit over and above the cost of production, and thereby fixed a certain price for dealers, was getting paid all right, but the agent was losing; and what he lost was partly a factory loss, so it all worked out the same as if the manufacturer had cut the price in the beginning.

"Then there was another item of loss.

Digitized by Google

Almost anyone who is asked to name the possible losses in the automobile business can guess it; it is used cars. It is some problem, but so far as I myself am concerned, I have put it on what I think is a business basis. I am not writing for a prize, but I believe the work the Motor World is doing in seeking the best method of dealing with the problem is a meritorious task, and I believe that through such co-operation the question is going to be answered for every dealer, large and small.

Meeting the Used Car Problem.

"The man before me, Martin, was anxious to make sales. A great many of the people who were prospects had cars already, so in order to get them to buy he had to take their cars in trade. In the early days of the business, prices and profits were such that a dealer could give a good price for a used car and make money, but with things as they are today the trade is on too much of a businesslike basis to permit such methods; they are entirely impracticable. Martin used to take a car in trade and allow a price for it that he ought to have known he never could get for it, even if he spent considerable time repairing and overhauling it. The result was that before long he had an elegant stock of used cars which he entered into his inventory at the prices he paid for them. This made the sales sheet balance and look good, but anyone can see that some day there had to be a big drop for someone.

Complaining Instead of Selling.

"There were other minor matters about Martin of which I do not approve. To begin with, I do not consider him a high class salesman or man of executive ability. He used to find fault with the advertising the factory did, and complained that it did not help him sell cars. While he was kicking, if he had paid a little more attention to window display and such matters, and had buckled down a little closer, he might have made up for whatever inferiority there was in the advertising—provided there was any; for I never noticed anything lacking.

Good Salesmen an Asset.

"Also, Martin felt that he should be the best salesman in the place; he didn't like to have a salesman who was better than himself. You can imagine the kind of a staff he had. He hated to lose his dignity by having anyone make more sales than he made. He lost sight of the fact that the man who climbs the highest does it upon the shoulders—not the souls—of other men; he is the man who can boss. The result of this management was that in the last year of Martin's reign the establishment went close to $50,000 in the hole. It wasn't quite that, but it was enough to make any man, no matter how big his business is, sit up and take notice.

"Along about this time I appear upon the stage, entering from the left rear and marching right down toward the footlights. I had been selling cars for some time, and one day the manufacturer said to me, 'Taylor, do you want to go out to so and so and be a dealer?' It didn't take me long to decide that; I did, so I went and am here yet.

"One of the first things I insisted on was that I be given a start with a clean sheet; I refused to accept the glorious array of old cars that Martin had stocked up for me, and the factory agreed to take them and dispose of them. Then I was let pretty much alone. The manufacturer practically presented me with the business on the chance that I would pull it out of the hole, and if I could I was to have it and pay for it with the profits. I am now paying for the business and already regard it as mine.

Business on a Business Basis.

"When I arrived and was enthroned as head of the establishment, I at once began to browse around and get the lay of things. Then I merely started out to sell cars on a businesslike basis. I quickly ran against the used car proposition at the very start. A man who already had one of our cars wanted a new one and wanted me to take the old one in trade. But the price he wanted was away beyond reason. I told him it was, but he couldn't see it; he had been educated to believe that big allowances for used cars were the proper thing, and he was a little inclined to be nasty about it. There was only one thing to do. I could have thrown away a lot of my profits and made a sale, but sales with no profits are bad business. I reasoned with the man and told him what I could pay for the old car. He went home and kept calling me up for two or three days. Then we made a deal. I named a price that I thought I could get for the old car, and agreed to take it in trade on the condition that for every dollar the old car sold for below the allowed price, he was to stand half the loss and I half, and if I got more he was to get all above.

Safe and Sane Trading Methods.

"He couldn't kick on that, when he saw the fairness of it; the result was that I cleaned the car and sold it for a slight profit over the allowance and told him to come in and get the money. I might have been obliged to lose a little, but with the safe and sane estimate I made as to what the car ought to bring I felt that I could afford to make the sale; had I lost at all, it would not have been enough to seriously affect my commission. Another method I often endeavor to employ when the owner will consent to it, is to take his car into the salesroom and sell it for the most we can get for it. I show him that whereas a broker would charge him 5 per cent. or more to dispose of the car, we will donate the services of our sales force free of charge, and we generally manage to get reasonable prices for the used cars. That stops the leaks through used cars.

Solving the Sub-Agent Problem.

"About those sub-agents; the manufacturer asked me one day why I didn't have as many as Martin used to have, and right then and there I told him the kind of subs Martin had placed. Not one of them ever sold a car, and they were just so much deadwood in the territory. The manufacturer waked up when I made my little speech; I also told him that inasmuch as the responsibility for the success of the business was on my shoulders I thought I ought to have my own way. He agreed with me. Any man now who wants to be a sub-agent has to show me that he is out to sell cars.

Hired a Really Efficient Salesman.

"When I arrived on the scene we had two or three mediocre salesmen, but I was better than any of them. I knew it and they knew it, and therefore none of them felt that he ought to sell as many cars as myself. I hadn't been here long before I began to look for a better salesman than I am. When I found the man I wanted I hired him. I consider him an added profit rather than an expense, because he has more than paid his salary since he has been here. With a better sales force under me I am now able to devote more of my time to executive matters, and have worked out one or two little schemes of selling that have been of considerable value.

Turned a Loss Into a Profit.

"At the outset the one thing I wanted to do was to make the business not lose money; not to make it pay big profits, but just to keep it from losing money. It was some job, but by hard work I did it. Now it is beginning to pay profits, and before long it will be paying the rate of income it should. Of course, when I started I planned to pay myself a salary. This is what any man should do, because if a man puts his services into a business instead of hiring a manager, he is entitled to the salary the manager would get; profits should not be counted until all these expenses are paid. I'm not bragging about these profits yet, because they are not startling; what pleases me is that I am not losing money."

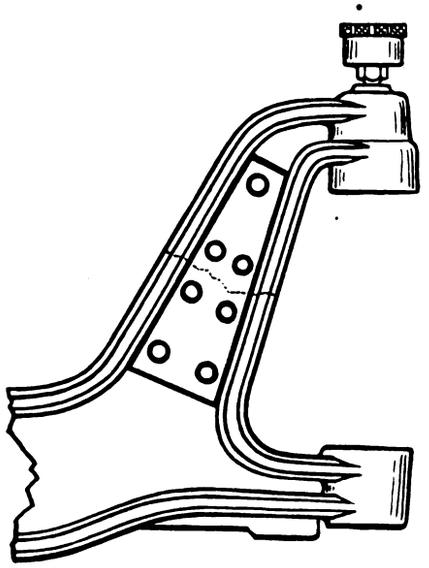
RESOURCEFULNESS IN THE REPAIR SHOP; AN INSTANCE

How an Intelligent Repair Man Used His Wits and Made a Broken Axle Almost as Good as New—Combination of Steel Plates and Hot Riveting That Was Strengthened by Cleverly Taking Advantage of the Contraction of Cooling Metal—Details of the Job.

There are many ways in which the motor car repairman who uses his brains can bring to his aid natural forces that will greatly help him in producing good work—work that will stand up for a long time, and tell its own story of thoroughness, sensible planning and workmanlike execution.



Making Use of Natural Forces.

There are some things that can be done much better with the aid of natural phenomena than by purely artificial methods. For instance, there is the familiar process of securing steel tires to wheels by shrinkage; the tire is made just the right fraction of an inch smaller than the wheel rim and then is heated, which causes sufficient expansion to permit the tire to be slipped on the rim. The rest is done naturally. The metal shrinks, as it cools, to its original dimensions, and in so doing compresses and binds the wheel together with a force that cannot be duplicated by any artificial process. Perhaps the very height of the shrinking process is reached in applying the jackets or "hoops" to big guns, a process without which the enormous ordnance now turned out could not well be constructed.

A Problem Presents Itself.

The shrinkage of metal can be taken advantage of by repair men in various ways, and it is by no means impossible to make use of this tremendous force in work which does not involve the use of such forms as rings or tubes; of course a flat piece of metal will expand and shrink, and it was by taking advantage of this fact that the repair job shown in the accompanying illustration was performed, and it was due very largely to the fact that advantage was taken of the shrinkage principle that the results obtained were so satisfactory.

One day a touring car, dusty from many miles on the road, drew up in front of a garage, after approaching so slowly and gingerly that the halt necessitated no application of the brakes. Inquiry elicited the fact that the garage possessed facilities for doing repair work, and the boss repairman was shown the damaged part. There was a crack in the upper jaw of the fork of the front axle on the left side, and it extended nearly through the forging—so nearly through, in fact, that the remaining shreds of steel parted when the car was slightly jolted in going up the incline into the shop. It was a disagreeable looking job. Welding was out of the question, because of the absence of either electric or oxy-acetylene apparatus for the purpose. The foreman, however, seemed quite undaunted, and did his thinking while the axle was being removed from the car, and the steering pivots and everything else that was loose taken off and, incidentally, carefully cleaned and put where they could be found again.

INGENIOUS STEERING KNUCKLE REPAIR

Commencement of Repair Operation.

The first process was to make two patches of mild steel, each three-eighths of an inch thick, to fit in the channels of the broken fork jaw, which was of the usual I-beam cross section. The patches were carefully fitted, one on each side, while the broken member was temporarily clamped together, and were bedded down so that when fastened in place they would have no tendency to twist or distort the fork. The ends were tapered off in order to give the job as neat an appearance as possible, though such work of necessity cannot be hidden or disguised. Seven holes were drilled in each patch, four below the line of fracture and three above, the narrow end permitting only three holes. Much care was exercised to bring the holes in both plates in exactly the same relative positions. The four holes in the wide ends were drilled while the patches were in position on the axle, the drill passing through both patches and the web of the fork at the same time. Then the plates were removed and fastened together with two short bolts which fitted closely in two of the holes, and then the three holes in the narrow ends were drilled through both plates at the same time. In this way there could be no doubt as to the holes coming exactly opposite.

What the Foreman Did Himself.

The next stage of the job was to hot-rivet the patches to the lower part of the fork, which was done with rivets which fitted the holes tightly, the result being an extremely solid piece of work. At this point the foreman, who had kept his modus operandi pretty much to himself, began to do things in a way that was rather peculiar, and he did the work all himself, too; evidently he was very particular about it. The broken-off fork arm was inserted between the projecting patches, where it fitted perfectly, and was gently tapped into place until the crack was closed up and its presence was betrayed only by the jagged lines that appeared in the flanges where they showed on each side of the patches.

Accuracy in Laying Out the Job.

Then, with a "scriber," which is a slender, sharp pointed steel tool used for scratching on metals, the locations of the holes in the narrow ends of the patches were transferred to the web of the fork, which had not been drilled. With a small, sharp pair of dividers, the centers of the circles were located and marked. But these centers were not used in drilling. The foreman marked the points where the drill was to enter a trifle higher up—further from the point of fracture—than the true centers of the scribed circles; the single hole near the end was set off more than the two nearer the crack. The holes then were drilled, and when the parts were brought together again it was found that the holes were just far enough "off" so that the closely-fitting rivets would not go through. Those who knew the boss waited to see what he would do, and only those who had

Digitized by Google

no. had an opportunity to see him tackle a difficult piece of work thought he had made a mistake.

Doing the Crucial Part of the Work.

No one was left in doubt very long. The work that followed required quick and accurate action and no false moves, so explanations were forthcoming. The big gas blow-pipe was set to work heating the two projecting ends of the patch plates, the broken fork arm having been removed from between them. A bunch of waste, wrapped around the metal at the point where the riveting already had been done, was kept wet by the constant application of water, so that very little heat spread along the forging. When the patches began to show signs of getting hot rivets with slightly tapered ends to permit easy insertion, were put in the forge, and by the time the patches were heated to a rather dull red the rivets were just at the right temperature to cause the boy who was heating them to raise the orthodox cry "Hot!" The axle end was laid on the anvil and the broken piece slipped into place, after a hasty but careful brushing off to make sure that there was nothing to prevent the proper closing of the fracture. And to the surprise of the inexperienced, the rivets, which before had refused to enter the holes, were tapped into place without much difficulty and were headed over firmly and well long before the patches were cold. After the riveting had been completed, the metal was allowed to cool gradually, the scale was rubbed off and a little touching up done with a file, and the work was done, all except putting back the parts on the car.

Expounding the Principles Involved.

The secret of the job was that the expansion of the steel plates, when heated, brought the holes in them directly into line with the holes in the web of the fork arm, so that the rivets could be forced in. As the metal cooled, however, it contracted to its original dimensions, and in so doing brought the two broken pieces together with great pressure, binding the whole job with a solidity that could hardly have been secured in any other way. Of course the work called for the exercise of no little judgment, for the amount of expansion and contraction was very small, and in order to take advantage of it all the marking-out had to be done with great accuracy and with a knowledge of the amount of expansion if the steel under heat; moreover, the hole near the end of the patch would be displaced by expansion to a greater extent than the two holes nearer the middle, because there would be a greater expansion due to the greater length of metal, and this also had to be considered. That the method is a practical one, however, is proved by the fact that the repair, which was intended only as a temporary expedient to last until a new axle could be procured, was so successful that the car was run for more than a year before the new axle was put in, and even then it was done more as a precaution than anything else, in order to prepare the machine for a rather strenuous tour.

Simple Means of Locating Engine Noises.

Despite their availability, those instruments akin to stethoscopes which are designed to assist in the location of knocks and other abnormal engine noises, rarely

METAL PIPE AS A STETHOSCOPE

are to be found in automobile repair shops. When anything of the sort is employed, it usually is a bicycle spoke, or other stiff metal rod, or even a slender wooden stick, held with one end against the source of sound and the other against the teeth of the "listener," which rude tool transmits sound vibrations in a manner quite surprising to one who never has tried the experiment. In at least one New York shop, however, there is utilized an even simpler and more effective "instrument." It consists of nothing more than a piece of metal pipe, one end of which is placed against the motor nearest to the suspected points of noise, the other near the ear, as shown by the accompanying illustration. The hollow pipe makes a better conductor of sound vibrations and the hand and thumb complete the "circuit." It has been found a remarkably efficient means of locating internal motor troubles.

Rubber Elasticity vs. Compressibility.

It seems hard to realize that rubber, which can be squeezed or stretched out of shape with the bare fingers, is practically incompressible; but it is true. It is elastic, not compressible. If a depression is made in a piece of rubber by applying pressure to its surface, a volume of rubber exactly equal to the volume of the depression will be raised, just as dipping the hand in water will displace a volume of liquid equal to the immersed volume of the hand. Confine rubber, however, so that displacement is impossible, and the familiar softness will disappear. This is the reason why solid rubber tires are made with as small a quantity of rubber as possible confined between the flanges, for this rubber has little cushioning effect, only the rubber which is free to expand being of any use for absorbing vibration.

Abuse That Shortens Life of Tops.

Just because the average automobile top provides a comparatively safe and convenient repository for small packages, hats and even tools, is no reason why it should be used for that purpose. Tops, as a rule, are treated to great indignities in this respect, and it scarcely is to be wondered that they show signs of wear long before their ordinary period of usefulness is over. When they are not in use they should be folded carefully, and, incidentally, it is well to raise them after a shower and let them dry in order to prevent them taking on a "set."

Strainers That Require Regular Attention.

In cars using exhaust gas pressure for the gasolene feed the strainers or other cleaners through which the gas passes on its way to the tank should be inspected and cleaned every two or three weeks, if the car is given an average amount of use. If the car is used a great deal, or if the motor is using an excess of lubricating oil or gasolene, the deposit in the strainer will be heavier and should be removed more frequently.

About Fitting Keys in Keyways.

In fitting a key in a keyway it should be borne in mind that nothing is gained by making a very tight fit at the top and bottom of the key. The strain all comes on the sides of the key and keyways, and if the key is fitted very tightly top and bottom the tendency will be to force one side of the hub bore away from the shaft, and, if the hub be of cast iron and not too strong, it is entirely possible to split it by a too tightly fitting key.

Wire Terminals That Give Satisfaction.

It is far better to use metal terminals on battery wires than to merely wind the bared wire ends around the binding posts; the special terminals hold better, look better and give better contact. If no terminals are used, however, the wire should be passed around the post so that the tightening of the binding nut will tend to wrap it more closely rather than unwind it.

KEEPING UNNEEDED OBJECTS OUT OF SALESROOMS

Things That Are of No Service and That by Distracting the Prospective Buyer's Attention from the Cars May Lose a Sale—Dealer Reilly Arouses His Head Salesman by Display of a Freak Wheel—Making the Car the Real Center of Interest.

"Automobile Row" in its holiday clothes was gay and enterprising in appearance; strips of bunting and streamers bearing the names of a multitude of cars supplemented the electrical display which transformed the "row" into an avenue of light after darkness fell, and there was every indication of something unusual in the air as Reilly and the Sales Manager in one of the factory's brightest and newest models glided down the street toward Reilly's salesrooms. From every hand came cheerful greetings which were all in accord with the spirit that seemed to emanate from the crisp autumn atmosphere.

Dealers' Fall Show Milliners' Rival.

As a matter of fact, there were "doings" in town; it was the dealers' annual fall opening, and no milliner or modiste ever put more vim into her layout of wares than did the association of automobile dealers, which every fall started the wheel of business rolling with a concerted boost. Every dealer tried his utmost to have the most attractive place on the "row," which accounts for Reilly's immigration with the Sales Manager and the bright new model.

This dealer, whose diminutive stature was all out of proportion to his energy, was determined to make the best showing he could, and accordingly he had informed the factory Sales Manager that he had to have a new car for one of the salesroom windows; there was no yes or no about it, he had to have the car—and as usual he got it. Roads were hard and dry after a week of sunshine, so Reilly decided to save freight and time and drive the car the 30 miles from the factory to his place of business; the Sales Manager didn't mind a bit getting into the spirit of the fall opening and, although he tried to make Reilly think it was doing a favor, he consented to ride down in the new car and stay over night to see the parade—for who ever heard of a fall opening of automobiles without a parade?

Reilly Specializes in Decorations.

Reilly's salesrooms were almost aglow with decorations, and as the car rolled in through the doors, the Sales Manager had no difficulty in recognizing traces of the acumen which every year made a full sales sheet for the proprietor. As the car was sent to the washroom for a touching up, the Sales Manager, the dealer and the latter's salesman began a casual inspection of the premises, for much of the decorating had been done during the dealer's absence. The Sales Manager noted the study which evidently stood back of the ideal arrangement of things, and was watching the reflection of his feet in the finish on the side of a limousine.

"What's that?" he suddenly exclaimed, at the same time pointing to a queer looking object which stood against the rear wall of the room.

"Huh," grunted the salesman.

Reilly merely smiled.

The Sales Manager walked over to inspect it.

The Object That Attracted Attention.

The object in question might have appeared as one of several things to an uninitiated person. Exteriorly it was round and about its circumference was what looked like a tire, but, if it were intended to be an automobile wheel, it looked peculiar, indeed, for where spokes should have been was a nickel-plated sheet of metal which made the object look like a cross between a gunner's target and one of those old-fashioned shields which every boy knows used to be carried by the "knight of old" when he went into battle for his lady fair. The boy knows all about them, because he has seen hundreds of them in his picture books.

The Sales Manager looked it over wonderingly. "What is it?" he again asked.

"A wheel, of course," replied Reilly.

"I know, but what kind of a wheel?"

"A regular hoodoo wheel," volunteered the dealer's salesman. "That's about all it's good for so far as I have been able to see."

A Smile Causes a Lecture.

Reilly's smile seemed to arouse unpleasant remembrances in the mind of his employe, but since this particular employe and Reilly were on terms of companionship and were in the habit of speaking their minds to one another, Reilly proceeded to "get his" and in an emphatic manner.

"Yes! Smile!" said the salesman. "Some day that darned thing'll lose a sale. Then who'll smile? Who'll be to blame?"

"What's the matter with it?" asked the Sales Manager, anxious to make peace. "How will it lose a sale?"

Biggest Sale-Killer in the Store.

"Lose a sale?" responded the salesman. "Lose a sale? That thing is the biggest sale-killer I ever saw. I bet I've moved that thing back into the office fifty times if I've moved it once. If we're going to sell fool wheels like that, all right; but, if we're selling cars, for the love of Selden or Dyer or someone else, keep that thing out of sight."

"What harm does it do?" said the man from the factory.

"Harm? All kinds of harm," almost shouted Reilly's salesman. "I wish the fellow that brought it here had it around his neck. Some inventor had it made and brought it here for the boss to try out. It's got an airless tire and has no spokes, and the principal other feature is that it looks like the devil himself. The boss, of course, couldn't see any harm in taking the thing and giving it a tryout if he got a chance, so he lets the crank inventor leave it in this salesroom. He stood it up against the wall and it stayed there all one afternoon. The next morning I had a prospect coming in, so when I arrived in the morning I moved the damned thing back into the office and put it out of sight in a corner behind the desk.

How It Distracts Prospective Buyers.

"The next day I found it over on the other side of the salesroom and I moved it back again. Every time I move it back, it gets out some way. I suppose Reilly rolls it out here to look it over or for some other purpose, and then he forgets to roll it back. Why, just to show you the damage in that piece of junk! The other day it got out on me again when I wasn't watching, and one of my prospects came in to look at a car. He was coming along in fine shape and was getting so enthusiastic that I was thinking of giving him a chance to sign a contract when he catches sight of that hunk of armor plate over in the corner. 'What's that thing?' he asked, and he straightway forgot all about the car, and

Digitized by Google

I had to go over with him and explain that the wheel was something new but that we didn't think much of it.

"Well—I finally got to talking about wheels in general, and then brought him back to the car to show him a point about our wheels, and finally I got him interested in the car again. O, of course, he finally bought a car, but maybe you don't think it took some funny work on my part! My heart dropped clear to my ankles when he spotted that wheel. I believe I'd have lost the sale if he hadn't been almost ready to buy when he came in. You can see how a think like that will impress a man, for when he was going out he walked over toward it and as he gave it a last look said, 'Gee, that sure's a funny looking thing.' I've been on the point of smashing it a dozen times, and——"

Admits the Salesman is Right.

Reilly's cheeks took on a tinge of rosiness at times as his salesman slandered the wheel, and now he interrupted and opened in his own defense.

"You're right," he said to the salesman; "I intended to take the wheel back every time I brought it out, but something came up each time and it must have slipped my mind. Anyhow, I'm going to send for that fellow and make him take it away. I don't want it around here; we can't use it."

"You can't get it away any too quick for me," replied Reilly's salesman.

Salesroom Void of Nonessentials.

"You see," continued Reilly, addressing the Sales Manager, "we make it a practice to keep out of the salesroom anything that may attract attention in the wrong direction, such as that wheel, for instance. It's true that when you have a man on the floor showing him a car he is more likely to pay attention to what you say and to get along toward the buying stage if he doesn't have anything to take his mind off what you are showing him. That's one reason our salesroom is kept so neatly. We keep it almost barren of objects except the cars, and if it wasn't neat and clean it would look like a barn and be unattractive. That red moulding and those potted plants in the corners add the necessary touch of cheerfulness.

Effect of Pictures in Salesrooms.

"When I first went into business I thought I ought to have my salesroom all trimmed up with pictures and such stuff, and if I could have gotten this wheel in those days it would have held a place of honor. I got over that, however. It took a little while for the idea to seep in under my scalp, but when it did I had one grand cleaning up. I eventually began to think that even the pictures on the wall were detracting the attentions of prospective buyers from the merits of the cars. Some of the pictures I moved into the office and two that showed cars finishing a race I moved into the windows. I put them at one side where they could be seen from the street. If anyone wants to see those particular photographs he has to get out in the street.

Window Good Place for Pictures.

"The pictures in the windows often cause a man to stop, and sometimes he gets interested in the cars in that way. If there is anything here that a man is likely to spot during a sales talk, and I feel that he is likely to buy at the end of the sales talk. I try to have him notice the thing and have it explained to him before I begin. I may be in the extreme in this thing, for some dealers like to have a few pictures of racing cars and such things on the salesroom walls, but I don't. I remodeled the salesrooms several years ago and had the walls finished up neatly but plainly and in such a way that I don't need to hang up pictures. When a man is on the floor here looking at a car, he has nothing else to distract him. The cars, also, are the center of attraction; in fact, there is not much else to see in the salesroom. What is a salesroom for if it isn't to show cars and, as my critical salesman said, if we're selling cars, let's get the rest of the stuff off the floor and out of sight.

Lights Burning When Store's Closed.

"We're a little over-decorated this week because of the fall opening. We've got more lights around than we have ordinarily. I don't mean to say that we have too many lights, but we have more of them now than the ordinary run of business would justify; the expense would be too heavy. But I'm a believer in light, and we keep several bulbs burning at night, but they merely illuminate the front of the salesroom and show up the cars. We have them turned off about the time the streets become deserted."

"See?" said the dealer's salesman, with a triumphant smile, "the boss admits I'm right for once."

"Did I ever say you were wrong?"

"Well, slowly responded the salesman, "I won't say that you said so in so many words."

"When did I ever indicate that you were wrong? Of course, you are a great many times," retorted Reilly.

"Do you two always scrap like this?" asked the Sales Manager, who had been an interested nonpartisan.

Both Reilly and his salesman were about to reply when the doors to the garage opened and the foreman directed the rolling in of the new model which, with every fleck of dust removed, glistened and shone as well as the day it left the paint shop at the factory.

Electric Association to Meet in Boston.

On Tuesday and Wednesday next, 8th and 9th insts., members of the Electric Vehicle Association of America will open their third annual convention in Boston, Mass., in connection with the electrical show which then will be in full sway in Mechanics' hall. The meetings, which will open at 10 o'clock in the morning, will be held in Paul Revere hall, Mechanics' building, and will be more or less professional sessions, at which a number of papers dealing with practically every angle of the electric vehicle situation will be read.

Among the papers are the following: Where We Stand Today, by C. E. Michel, of the Union Electric Light and Power Co., St. Louis, Mo.; Street and Traffic Conditions as Applied to the Use of Electric Vehicles, by R. McAllister Lloyd, of the International Motor Co., New York; The Publicity Campaign of the Electric Vehicle Association of America, by Frank W. Smith, of the United Electric Light and Power Co., New York; The West as a Field for Electric Vehicles, by Dr. M. Elkstromer, of the Denver Gas and Electric Light Co., Denver, Col.; Notes on the Cost of Motor Trucks, by Dr. Harold Pender and H. F. Thompson, of the Massachusetts Institute of Technology.

Other subjects to be dealt with are: Some Recent Developments in the Lead Battery, by Bruce Ford, of the Electric Storage Battery Co., Philadelphia, Pa.; Electric Vehicle Development in the East, by Stephen J. Thompson, of the Public Service Electric Co., Newark, N. J.; Electric Vehicle Charging Apparatus, by R. E. Russell, of the General Electric Co., Schenectady, N. Y.; Progress of Commercial Cars in America, with Special Reference to the Electric, by E. S. Foljambe, paper by the Westinghouse Co.; Insurance from the Standpoint of Electric Vehicles, by Carl H. Clark, of Field & Cowles, Boston, Mass.; The Edison Battery in Service, by H. H. Smith, of the Edison Storage Battery Co., Orange, N. J.; Electric Vehicle Service, by J. C. Ford, of the National Electric Lamp Association, Cleveland, Ohio.

When Hood Fasteners Are Advantageous.

There are good reasons for having good fasteners on motor hoods and for keeping them fastened. When a car is running at a fair speed the pressure of the air under the hood, due to the movement of the car, together with the action of the fan, while not sufficient to lift the hood, is sufficient to help it to rise when the car passes over a jolt in the road.

PRINCIPLES THAT UNDERLIE LIGHTING SYSTEMS

The Dynamo Treated as a Unit and the Inherent Characteristics of the Several Types Explained in a Non-Technical Manner — Shunt Windings and Other Windings, Wherein They Differ and the Reasons for Their Uses — How Troubles May Be Remedied.

(This is the second of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by dealer and owner alike.)

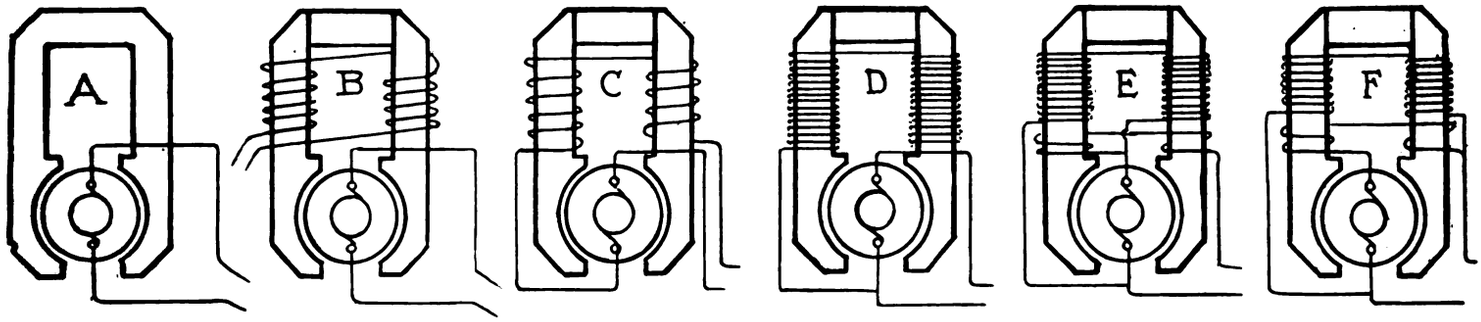
To those who are habitual railroad travelers, the question often may have occurred: "Why all this fuss about the engineering difficulties attendant upon the development of electric automobile lighting systems, and why were they not long ago developed to the state of perfection of the railroad lighting system, with its unfailing mechanism and unfailing light?" The most cursory examination must serve to make plain the answer.

Railroad Car Not Like Automobile.

In the first place, the typical railroad train that is electrically lighted is the train de luxe. It is a heavy, ballasted, limited train that makes few stops and is operated at practically constant speed for long periods. It runs on a perfect roadbed from which all the jolts and jars and many of the grades and curves have been scientifically ironed. And last, but not least, weight is no object. In fact, Pullman passenger coaches purposely are made very heavy in order that they may hold the rails and be unaffected by the slight inequalities in the smoothness of the tracks. Consequently, electric lighting systems for use in railroad work can be big and heavy and solid. There is no necessity for them to be small and compact, accurately automatic and light in weight. Nor do they require to be exceptionally simple, for the railroad companies employ a corps of workmen expert in such subjects to look after them and care for them and see to it that they are maintained at their highest state of efficiency. Incidentally, such service is positive insurance of their practical infallibility and this feature is not beside the issue.

From all of which it surely must appear that the automobile electric lighting system is akin to the railroad electric lighting system in very few particulars. The automobile is light—reduction of weight to the minimum justly has become a fetish in the majority of automobile factories—and it follows that its equipment must also be light. It does not operate at constant speed under ordinary conditions for more than a few minutes at a time. It is run over give and take roads from which very few of the wrinkles (if they may be styled wrinkles) have been smoothed out.

Space is at a premium in the majority of automobiles, which necessitates that the electrical equipment be reduced to the smallest possible size. And despite all the other considerations, each of which introduces its own particular problem to be solved, the equipment must be as simple as it is possible to make it. The word "must" in the foregoing sentence might better have been written in italics, or capitals, in order to give it the emphasis and importance which it deserves.



Electric System Must Be Simple.

The apparatus must be simple because the average automobile owner knows little, and, as a rule, cares less about it. The dealer, sad to relate, and in many cases the manufacturer of the car, knows scarcely more than the car owner, and therefrom depends a tale that is sad alike to the owner, the dealer and the car manufacturer, not to mention the electrical apparatus manufacturer. But it probably is saddest of all to the dealer, who, by reason of his intermediate position is expected to know all the manufacturer knows and all the car owner ought to know in the bargain. And that he does not come up to expectations in these respects is largely his own fault, and if he could but be made to see it, his ignorance acts as a veritable boomerang that strikes back at himself.

Educational Campaign for Dealers.

Car manufacturers and electrical equipment manufacturers are willing, nay, anxious, to educate dealers and owners, and dealers in particular, into the mysteries (such as they are) of their apparatus. It is to their advantage to do so, and it most certainly is to the advantage of the dealer to know thoroughly the construction and operation of the particular system with which he comes in contact. And though the car owner scarcely can be expected to be familiar with all the whys and the wherefores of such apparatus it is perfectly legitimate to expect that the dealer shall have at least a working knowledge of the ins and outs of the system with which the car he sells is equipped.

As a matter which cannot well be overlooked, the situation rapidly is approaching the point where it will be absolutely necessary for the dealer to know, and to know thoroughly, the construction and operation and a tithe of the theory of dynamo electric lighting and engine starting systems. Progressiveness requires the assimilation of such knowledge on the part of the dealer, and unless he becomes a progressive in spirit as well as in theory another angle of the situation, which even now is apparent, may exert an unexpected influence that scarcely can be good.

DIAGRAMMATIC SKETCHES ILLUSTRATING THE VARIOUS METHODS OF DYNAMO FIELD WINDING

Digitized by Google

Briefly, it is this: Due to the already widespread use of auxiliary electrical equipment more than an inkling of the desirability of knowledge has come to not a few owners who forthwith have set out and discovered for themselves what the dealer has been unable to tell them. So soon as the opinion is permitted to prevail that the dealer cannot help out the owner by explaining the operation of his electrical system in an understandable and intelligent manner, and not in the really ludicrous way it sometimes is attempted, then will the situation become lamentable if it is not so now. And it is up to the dealer to prevent such a situation, and, so far as he is able, to delete that part of it which now exists.

Electric Systems Not Difficult.

As was made clear in the last issue of the Motor World—and as will be made clearer in this and in succeeding articles—neither the dealer nor the car owner will find the road to a working knowledge of the ordinary electric lighting, and, or, engine starting system a particularly hard one to travel, and, to carry the metaphor a little further, only the surface aspects are all that really are necessary.

For reasons that already have been set forth, any electric lighting system to be of practical value must be self-contained. That is to say, the dynamo or generator which serves to charge the storage battery must be incorporated as a part of the system. In fact the dynamo virtually is the heart of the system, for without it as a source of energy the system would be valuable for the purpose of supplying light only until the storage battery became exhausted. Needless to say, the battery could be recharged from an outside source of current, but such methods are not practicable in a great many cases—touring, for instance—nor are they economical, for battery efficiency necessitates that as nearly regular charge and discharge rates be maintained as is possible.

Damage in Low Discharge Rate.

When the battery is charged from an outside source of current—which in itself is a great deal more expensive that to charge it from a generator incorporated in the system—there is a tendency to discharge it below the normal discharge rate in order to reduce the number of trips to the charging station or to "use the juice to get home on" when, according to the condition of the battery, the kerosene lamps really should be used. Such practice, of course, is detrimental to the battery and reduces its efficiency to say nothing of adding to up-keep expense by necessitating more or less frequent trips to the repair shop.

Dynamos are divided into two classes: Alternating current and direct current machines. As the name of the alternating current machine indicates, it generates current, the direction of which alternates, i. e., it flows first in one direction and then in the other. Such machines, however, never are used in automobile electric lighting systems for the good and sufficient reason that it is impossible to charge a storage battery from one of them without the addition of more or less complicated apparatus which scarcely could be expected to find a place on a car. Consequently, the direct current machine is the only one which holds interest.

Three Classes of Dynamos.

Direct current dynamos are further divided into three other classes, which take their names from the method of winding and connecting the field coils. In Fig. A, for instance, in the accompanying illustration is shown a diagrammatic sketch of the wiring used in a permanent magnet dynamo or a magneto. No field winding whetever is used, the armature coils rotating in the magnetic field generated by the permanent magnets and the resultant electric current being collected by means of a commutator having two sections which are connected to the two ends of the armature winding. The arrangement is the simplest possible, of course, and is the basis upon which are builded many of the successful electric systems on the market at present. With the addition of coils to the armature it becomes necessary to add segments to the commutator, for there must always be two segments for every armature coil.

The Separately Excited Type.

In Fig. B is illustrated what is known as a separately excited dynamo such as is commonly in use in large central stations for the generation of current for street lighting and street car operation. In this arrangement, the field pieces are not permanent magnets, but are magnetized immediately a current of electricity is sent through the field windings, a separate source of energy, preferably a smaller dynamo being used for the purpose. Aside from the fact that machines of this type seldom are used in automobile systems, the principal advantage of the arrangement lies in the fact that much of the load is taken off the commutator, sparking is reduced and the life of the parts proportionately increased.

Wherein the Series-Wound Differs.

The series wound dynamo (Fig. C in the accompanying illustration) differs from the separately excited dynamo only in that the field winding is connected in series with the armature coils. That is to say, the current passes in a continuous stream through the field windings and the armature windings, first through one and then through the other. The field winding is composed of a comparatively few turns of heavy wire. Owing to the fact that it is difficult to obtain either constant current or constant voltage with the series machine unless the speed of rotation of the armature is maintained constant within well-defined limits, it seldom is used for automobile work. Another feature which militates against its use is that a series generator, when operated as a motor, runs in the opposite from that in which it generates current. Consequently it is virtually impossible to employ it for combined lighting and starting systems without the addition of complicated gearing and clutch apparatus. The characteristics of the series wound generator is that the voltage is low at light loads but increases rapidly as the load is increased, until the magnetic field reaches the point of magnetic saturation.

About the Shunt-Wound Dynamo.

In the shunt wound dynamo (Fig. D) the field winding, which consists of a large number of turns of comparatively fine wire, is shunted across the brushes which collect the current from the armature. That is to say, the armature and the field winding are placed in parallel. One of its characteristics is that the machine operates as a motor in the same direction as it generates current, for which reason it is used largely where a combined generator-motor unit is required. By reason of the arrangement of the wiring, the exciting current in the field approximates only about 5 per cent. of the total current of the machine; it depends largely upon the voltage at the terminals of field winding and the resistance of the field. Owing to the increased drop in the armature and the decreased field excitation, the voltage of a shunt wound machine decreases rapidly as the load is increased regardless of the speed. From which it appears that if a shunt wound generator is operated as a motor from a constant source of current, its speed will be practically constant regardless of the load, for the reason that the strength of the field remains constant.

Explaining Compound Winding.

As the name of the compound wound dynamo indicates, it is a composite of the two types. The field is composed of two sets of windings, series and shunt, and the machine is styled either long shunt (Fig. E) or short shunt (Fig. F), according to the method of connection of the field wires. In the short shunt machine the shunt coils, which are formed of a large number of

Digitized by Google

fairly fine wires, are connected across the brushes, the series winding, composed of a small number of turns of larger wire being connected in series with the brushes The long shunt machine differs from the other in that the shunt connections are made at the terminals instead of at the brushes.

The peculiar characteristic of the compound wound generator, the characteristic which makes it of so much value for all classes of work, is that its winding can be so constructed as to permit either an increase or a decrease in voltage as the load increases. Incidentally, it can be maintained practically constant, regardless of load fluctuations. The compound generator is similar to the shunt generator, in that it operates as a motor in the same direction as it generates current. Compound motors are used, generally, where the load varies considerably, where the extreme speed variations of series motors would be objectionable and where sudden increases in load require increased torque which shunt wound machines cannot give

Connection Making by Amateurs.

From the explanation and with the aid of the accompanying diagrams, it should be a simple matter for the average person, not versed in the intricacies of electricity, to determine the difference between the various types of dynamos as revealed by their methods of winding. Though there should be no excuse for disturbing the various connections which invariably are made correctly at the factory and should not be altered, the diagrams nevertheless will serve to assist in case it should become necessary through accident to make the connections over again. Occasionally it may happen where a dynamo is to be attached by an amateur that difficulty will be experienced, owing to the fact that the machine operates in the reverse direction from that which can be obtained through simple gearing. In this case it is a simple matter to reverse the field connections at the brush holders, which will have the effect of reversing the direction in which the machine generates.

When a Dynamo Refuses to Generate.

Theoretically, any dynamo other than a separately excited one, will generate current immediately it is started, the reason being that when a piece of iron is once magnetized it retains a certain amount of residual magnetism which is sufficient to cause the generation of a slight current. The current increases, of course, immediately the initial flow has been started. If, after a machine has been started, it should fail to generate, the brushes should be examined to ascertain whether they make contact with the commutator. Sometimes a gummy substance, caked on the commutator, accumulates and prevents proper contact being made. This is the result of too much oil and should be removed by applying a small piece of cloth wet with gasolene to the commutator while the machine is running. If the machine still fails to generate, connections to the brushes should be examined, as these are the most prolific sources of such trouble as generally has to be reduced. Occasionally they become loosened and oil collects in such a manner as to prevent proper contact being made. The remedy, of course, is to remove the oil from the contact surfaces and tighten the connections.

Field and Armature Winding Troubles.

Though short circuits in the field or armature winding seldom occur, they are a possibility which should be remembered in "doctoring" a sick machine. Generally, they can be detected, if all the connections are perfectly tight, by a considerable drop in the output of the machine or an absolute failure to generate. When they occur, repairs should not be attempted by any one other than an expert, and the job is preferably one for the manufacturer of the machine who can tell in an instant the exact trouble, with the aid of testing instruments. In most cases it is but the work of a few moments to remove an injured field coil and replace it with a good one, and the cost is low. Armature windings, however, require more time to repair, for the wiring is so interwoven that it is impossible to remove one coil without taking them all out. Thanks to the indefatigability of manufacturers in perfecting their machines, however, trouble with the windings rarely develops, and about the only thing that can happen is a loosening of the terminals of the wires.

How the Terminals Are Marked.

Another frequent source of trouble with which very few, including the manufacturers of cars, are familiar, lies in the connections between the dynamo and the battery, or the switchboard, as the case may be. In the first place, the positive wire of the dynamo, which generally is indicated by a plus sign (+), must invariably be connected with the positive side of the battery. Generally the positive battery terminal is painted red for distinction, and it, also, is marked with a plus sign. The negative wire from the dynamo, of course, must be connected to the negative terminal of the battery, which, in contradistinction to the positive terminal, is marked with a minus sign (—).

RADFORD FORECASTS THE AUTOMOBILE OF FIFTY YEARS HENCE

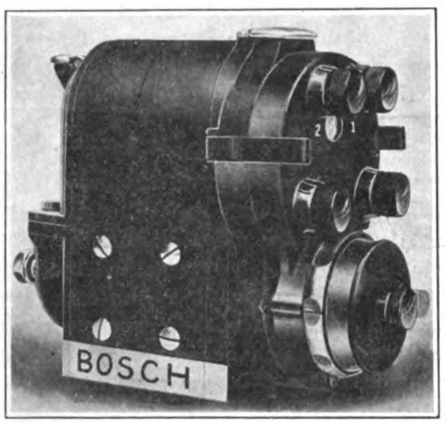
Prophesies the Utter Extinction of Gasolene Types and the Sweeping Triumph of Electricity—Believes Developments in "Wirelessness" Will Play an Important Part in Bringing About the Result.

In ten years the supremacy of gasolene as a fuel for motor car propulsion will be broken, and electricity will perform the greater part of the work of turning the wheels; in fifty years electricity will not only be supreme, but it will be transmitted to cars by wireless systems, so that automobiles will not have to carry with them storage batteries or other sources of electrical energy. Such, at least, are the expressed opinions of W. H. Radford, consulting engineer of the Warren Motor Car Co., who has very decided views as to the future of the automobile, which, with modifications, are shared by others.

Radford does not believe that the present type of motor car is anything like the car of the future, either in motive power or in body design; he asserts that the short time the motor car has been in process of development has shown only one phase of its possibilities. "The possibilities of the automobile are unlimited," he says. "What has been done is insignificant compared with what will be done."

Gasolene will not last long as a motor fuel, according to the engineer's belief; neither does he incline toward the idea that alcohol will prove a solution of the fuel problem. Kerosene, or kindred petroleum products of the baser orders, he believes will form an important step in the working out of the car of the future, but only one step—toward electricity.

"In fifty years from now, and the probabilities are in less than that, all motor cars will be propelled by electricity," continues Radford. "I do not mean that automobile owners will be compelled to carry around a thousand pound storage battery with them, but they will secure their power from wireless stations.



"The wireless system as used now is crude. The high towers will be eliminated and there will be a means of transmitting and catching the current without the use of high voltage now necessary, nor the tall staffs that connect the wires."

INTENSIFIED SPARKS FROM NEW BOSCH INSTRUMENT

Elimination of Four Magnets That Has Increased Electrical Efficiency—Waterproof Construction Also a Feature.

Despite the high degree of perfection which years of experience and careful designing and workmanship have effected in the various products of the Bosch Magneto Co., the activities of the company and its intimate knowledge of ignition problems have afforded opportunities for improvement from time to time, and though new instruments or new methods of construction seldom are placed on the market, when they are brought out they serve to attract fully warranted attention. In the new type ZR magnetos, which just have been placed on the market, after careful testing extending over a year or more, are exemplified several points in magneto construction which mark an even higher plane of perfection than ever attained before.

BOSCH "ZR" WATERPROOF INSTRUMENT

NEW BOSCH "ZR" MAGNETO PARTLY DISASSEMBLED SHOWING ELEMENTS

In many respects the type ZR magneto is similar to the earlier type DR, which has come into such general use for both pleasure and commercial vehicle work, to say nothing of its application to aeroplanes and motor boats. It differs from the former, however, chiefly in that it has but two single magnets instead of three double magnets, and that it is perfectly waterproof, which also means that it is dustproof and oilproof. Despite the fact that but two single magnets are used, however, the sparks which are produced are quite as intense as those produced by the DR magneto and due to a slight rearrangement of component parts and to refinements of design very heavy sparks are produced at exceptionally low armature rotative speeds, thus facilitating easy starting.

One of the reasons why the magneto produces hot sparks at low speeds lies in the shape of the pole pieces. Instead of being cut off flush with the armature they are extended outward over the armature in the form of long fingers. What is even more surprising is that sparks of sufficient intensity to fire inordinately weak mixtures are produced with the ignition timed to take place with the piston a considerable distance down on the power stroke. In other words, the sparks that are produced with full retard are scarcely less intense than those that are produced with full advance. Another noticeable difference between the type ZR magneto and its prototype, type DR, is in its appearance. Except for the usual timing arm, the ZR magneto is free of external protruberances and presents an unusually smooth and clean exterior.

The method of rendering the instrument proof against the ingress of water or dirt consists in fitting a tight protecting hood at the shaft end, the slip ring connection and the safety gap thus being thoroughly protected. The hood is practically a continuation of the end plate, and in addition to fitting snugly against the magnets is provided with a special packing which ensures an absolutely tight joint. Packing also is used between the magnets. As the distributer plate is fitted to the opposite end, forming a tight joint, the internal parts are completely housed and protected. Another feature which assists in preserving the instrument waterproof consists in the elimination of the opening in the base, which in the older instruments serves to house the brushes, by means of which the return current to the ground is conducted to the engine frame. In the ZR magneto the grounding brushes are enclosed in hollow screws.

Not only is the instrument itself waterproof, but the connections as well are protected. The binding screws of the high tension distributer as well as the binding screw for the switch are of such construction that short circuits through the agency of water are rendered impossible. As a result of the complete housing of the instrument, its mechanism is rendered practically noiseless, even the scarcely audible click of the contact breaker being muffled in the new construction.

Another important improvement in construction which has been made concerns the method of timing the instrument after it has been set in place. Incidentally, it should be added that as the base is standard, the new magneto may be substituted for any of the older type instruments without the slightest trouble. In the older DR type instruments it was necessary in order to ensure accurate timing to remove the dust cover from the contact breaker and the distributor disk. In the new instrument, however, provision is made for timing without the necessity for disturbing any of the parts. Above the distributer gear there is a small window hidden by the upper oil cover. Through this the distributing gear may be seen. On the edges of the window there are two red marks with which the armature may be registered by rotating the distributer gear. A second window is provided in the face of the distributing gear, and behind it there is a disk marked with the numeral "1." Its appearance signifies that the armature is in position to fire number 1 cylinder. In common with the older DR magnetos the new ZR type is produced for both four and six-cylinder engines in either independent or dual form and for either single or double spark.

USED CAR PROBLEM IS UPPERMOST AT SALES MANAGERS' CONVENTION

(Continued from page 5.)

The proceedings opened on Monday, when three papers were read: "Selling and Advertising," by J. G. Monihan, of the Premier Motor Mfg. Co.; "Motor Car Equipment," by George E. Daniels, of the Oakland Motor Car Co., and C. S. Jameson, of the Willys-Overland Co.; "Freight and Shipping," by J. S. Marvin, traffic manager of the National Association of Automobile Manufacturers. On Tuesday the program was made up of "Territory and Selling Rights," by Alfred Reeves, of the Maxwell-Briscoe Motor Co.; "Annual Models," by Charles W. Mears, of the Winton Motor Carriage Co., and S. D. Waldon, of the Packard Motor Car Co.; "Enclosed and Semi-Enclosed Bodies," by H. O. Smith, Premier Motor Mfg. Co.

Opinions on Motor Car Equipment.

The subject "Motor Car Equipment" probably was productive of the most discussion on Monday. In presenting their papers, both Daniels and Jameson substantially concurred in the opinion that equipment is necessary and that the fullness and quality thereof should be governed by the price and grade of the car. The burden of expression seemed to favor full equipment in the literal sense of the term, one speaker vigorously declaring that the public was not disposed to pay fancy prices for articles of equipment and that it is unfair to ask that it be done when the proper equipping of a car is wholly within the duties of the car manufacturer himself. Several times during the discussion it was suggested that the matter be referred to a committee, which would compile and report back exactly what constitutes full equipment, but the suggestion was not put in the form of a motion and was not pressed.

Opposes Too Much Standardization.

At one stage of the proceedings, when the matter of standardization was talked of, Charles W. Mears, the Winton sales manager, made a strong plea for the retention of individuality. He held that it was neither profitable nor desirable for cars to be too nearly alike, and that carrying standardization too far would rob the industry of the benefits of competition, which are practically priceless. He cited the long defunct "bicycle trust," with which he was familiar, as a notorious and historical instance of the effects of limiting individuality and stifling competition between once wholesome rivals.

From the appearance of things most of the sales managers had set considerable store on the subject "Selling and Advertising," which had been alloted to J. G. Monihan, the Premier advertising man. Monihan, however, disappointed expectations by delivering an address which largely was of a humorous nature, a fact which led Messrs. Mears and Reeves, among others, openly to express regret that such a serious subject should be so lightly treated. Monihan dealt not at all with selling. He talked only of advertising and in most serious vein criticized the methods in vogue in the automobile industry. He seemed to believe that much of the money now spent for advertising should be diverted into indirect channels and suggested that weaving automobiles into paintings by famous artists, and into fiction by equally famous authors, should serve better purposes. He even remarked that compared to the present outlay, the sum of $500,000 would not be too small for the purpose of stimulating artists and authors, and there were those who were not certain that he was humorous when he suggested that the Board of Trade could well afford to provide a fund for that purpose.

Co-operation in Transportation.

If Monihan's address lacked seriousness, the paper read by J. S. Marvin, traffic manager of the N. A. A. M., was intensely serious and practical. Among other things, he advocated the organization of transportation departments in all automobile factories. He said that such departments considerably would better the service obtained from railroads, and that if they would forward bills of lading to the N. A. A. M. traffic department, and that if all dealers similarly would forward their freight receipts to the N. A. A. M. for audit, the national organization would be able to render service which would return to makers and dealers in the form of dollars. Marvin explained that there are many zones in which the application of freight rates results in overcharges which only can be discovered by an expert who has to do with railroad affairs. Marvin also asked the sales managers to urge dealers promptly to unload freight cars when they are received, and in that way help prevent the shortage of automobile freight cars, which caused so much embarrassment last season.

Many Dealers Better Than Few.

On Tuesday, when Alfred Reeves handled the topic "Territory Selling Rights," he compared the policy of giving large slices of territory to a few large distributers with that of proportioning the country into many small parcels and handling all of them direct from the factory. He himself unhesitatingly declared that he had rather have 10,000 dealers selling one car each than 100 dealers each selling 100 cars. Reeves also touched on the matter of "poaching," that is, the practice of one dealer selling cars in another dealer's territory, which has given rise to all manner of friction and bad feeling, and he and most of the others present shared the belief that under such circumstances the commission should be equally shared by the two dealers concerned, but that circumstances should govern cases, and the manufacturer be the arbiter when such disputes arise.

Novel View of Discount Situation.

Discounts did not very largely enter into the convention, but Reeves was one of those who mentioned the subject. He made the somewhat novel point and caused some head shaking by expressing the belief that cars listing at less than $2,500 should be subjected to a smaller discount than at present prevails, while those that list above that price should have a better discount. He defended his position on the ground that dealers who handle large cars are compelled to do more trading and, therefore, incur more risk.

In selecting C. W. Mears, of the Winton company, and S. D. Waldon, of the Packard company, to treat the subject "Annual Models," it probably was assumed that they represented opposite points of view. While most manufacturers incline away from the annual model policy, Packard is almost irrevocably committed to the system, and is one of those who generally is charged with abnormally "forcing the season" by announcing next year's models before the sale of the previous year's product has been completed. In his paper, Mears cited arguments for and against the system, and while Waldon naturally defended the Packard stand and traced the manner in which the season gradually had been "forced" for several years past, his stand was not so pronounced as had been expected. He, in substance, said that the problem will work itself out in a natural way and be worked out by each individual in his own way.

Early Models Kill Spring Trade.

The concensus of opinion, however, appeared to be opposed to the annual model policy, and there was small dissent from the assertion that spring business practically has been killed by the launching of new models in May, June and July, and in

Digitized by Google

one instance in February—so it came out at the conference—the February launching being in the nature of private information concerning 1913 models which had been conveyed to agents in February, 1912.

What Is Best Announcement Month?

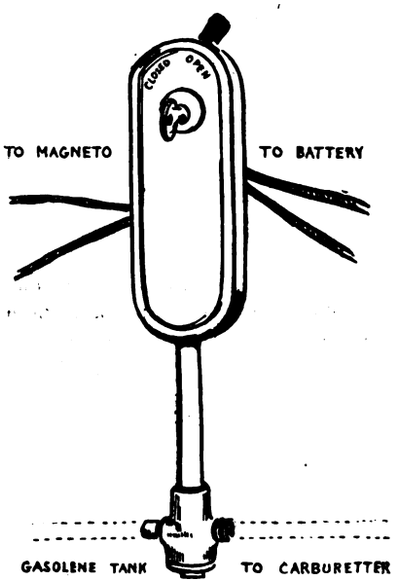
There was some discussion as to what month best would constitute the opening of a new season, but nothing came of it. One of the sales managers suggested December as being the best month for that purpose, holding that as it is the poorest selling season, it would be stimulated by the announcement of new models.

Even those who decried the annual announcement of new models agreed, however, that for factory purposes a change of model numbers or a designation of some sort is absolutely necessary.

Body Standardization Discussed.

"Enclosed and Semi-Enclosed Bodies," the subject assigned to H. O. Smith, of the Premier Motor Mfg. Co., was of more importance than appeared on the surface. The demand for such bodies is growing, and those manufacturers who do not build their own bodies have been caused no little embarrassment. Although increasing, the demand is purely problematical and the car maker is, therefore, in no position to place advance orders for bodies or to take undue chances. Mr. Smith advanced the suggestion of a standardized chassis or frame and the development of a standard body or bodies to fit such chassis or frames, believing that certain measurements at least would tend greatly to minimize the present difficulties, which, however, were in no way solved by the discussion. J. W. Fulreader, of James Cunningham Son & Co., who not only build cars but who are even more extensive body builders, pointed out that even a standardized chassis and a standardized body would not help matters. There is the matter of fenders and too many others to be considered.

Those Who Attended the Meeting.



Those in attendance at the convention were as follows: Autocar Company, H. M. Coale; Cadillac Motor Car Co., A. C. Howard; Cartercar Company, H. R. Radford, W. S. Williamson; Chalmers Motor Co., Percy Owen; Jas. Cunningham Son & Co., J. W. Fulreader; Flanders Motor Co., Wm. E. Metzger; Hudson Motor Car Co., C. C. Winningham, R. B. Jackson, E. C. Morse, R. D. Chapin; International Motor Co., H. D. Watson; Knox Automobile Co., H. K. Sutherland; Locomobile Co. of America, J. T. Roche; Lozier Motor Company, C. E. Emise; Maxwell-Briscoe Motor Co., Alfred Reeves; Mercer Automobile Co., W. T. White, E. H. Sherwood; Mitchell-Lewis Motor Co., Leo A. Piel, J. M. Cram; Moline Automobile Co., W. H. VanDervoort, Rufus Walker, Jr.; Moon Motor Car Co., Wm. J. Coghlan, E. J. Moon; National Motor Vehicle Co., J. M. Clarke; Nordyke & Marmon Co., Herbert H. Rice; Oakland Motor Car Co., Geo. E. Daniels, J. B. Eccleston; Packard Motor Car Co., H. H. Hills, S. D. Waldon; Paige-Detroit Motor Co., Jas. F. Bourquin, H. Krohn; Peerless Motor Car Co., R. S. Schmunk; Pierce-Arrow Motor Car Co., J. Elmer Pratt; Premier Motor Mfg. Co., John Guy Monihan; Selden Motor Vehicle Co., James Joyce; S. G. V. Company, F. F. Weston; F. B. Stearns Co., R. H. Williams; Stevens-Duryea Co., H. C. Beaver; E. R. Thomas Motor Car Co., C. S. Henshaw; The White Company, Walter C. White; Willys-Overland Co., C. S. Jameson; Winton Motor Carriage Co., C. W. Churchill, C. W. Mears.

Favary's Substitute for Pneumatic Tire.

One of the most recent ideas formulated with a view to the production of something better and less fragile than the pneumatic tire was described, scientifically and at length, in a paper, entitled "Proposed Substitutes for Pneumatic Tires," read last week before the Metropolitan section of the Society of Automobile Engineers by Ethelbert Favary, the inventor of the tire in question, who has organized a company for its exploitation. Briefly, the tire differs from the pneumatic in that it is not inflated, and from the solid tire in that it is not composed of a single ring of rubber, nor does it depend upon the rebound of compressed rubber for its resiliency. A concentric series of endless bands of specially woven fabric and rubber are superposed, but are supported, so that they do not touch the wheel rim or each other, by aluminum blocks quite closely spaced. The first series of blocks separates the first band from the rim; the second series is spaced so that the blocks rest on the first band midway between the blocks of the first series, and so on, there being three bands and three series of aluminum blocks. The tension of the rubber-and-fabric bands, and consequently the resiliency of the tire, is regulated by the use of shims under the blocks. Tires made according to this plan have been subjected to severe tests in England, and the results are said to have been very satisfactory.

Locks Both the Fuel and the Spark.

In these days of many automobiles and many persons capable of driving them, the risk of theft of a car left unattended is by no means inconsiderable, and naturally there are many ingenious devices on the market designed to thwart such robbery. Not the least ingenious of these is the "Capitol autolock," shown in the accompanying illustration, which not only shuts off the gasolene when the key is turned in the Yale lock, but also disconnects both the battery and the magneto, so that neither fuel nor spark can be supplied to the motor. The gasolene valve is fitted with a strainer. The instrument is attached to the riser of the front seat, or, for that matter, to any convenient point where the gasolene pipe and the wiring can be carried to it. The lock is marketed by the Esco Auto-Lock Sales Co., 1000 Woodward avenue, Detroit, Mich.

CAPITOL COMBINATION LOCK

Marathon Takes Over Chicago Agency.

The Ross Motor Sales Co., 1712 South Michigan avenue, Chicago, which has handled the Marathon car, has been taken over by the Marathon Motor Works, of Nashville, Tenn., and henceforth will be operated as a factory branch. Ross will continue to officiate as manager of the establishment.

Victor Pump Enlarges Name and Capital.

The Victor Pump Co., of Grand Rapids, Mich., which manufactures oil and gasolene pumps, has changed its name to the Victor Pump & Engine Co. Concurrently, it has increased its capital stock from $12,000 to $25,000.

G & J to Erect $100,000 Warehouse.

The G & J Tire Co., of Indianapolis, has let contracts for the erection of a warehouse in that city, at Louisiana and Murphy streets. The plans call for an outlay of $100,000.

De Palma at Length Gets a Grip on the Cup

After Several Attempts Plucky Italian Driver Leads Home the Vanderbilt Field and at 70-Mile-an-Hour Pace—Tetzlaff, Who Was Runner Up Till He Failed, Also Shares the Glory—Hughes in His Mercer is Third.

Ralph De Palma surely has shaken off the jinx which has pursued him with more or less persistence for the better part of a year. If his win in the Elgin road races did not serve to make plain that fact, then his victory in the Vanderbilt cup race yesterday (Wednesday), certainly has done so.

Always careful and always smiling even in the face of defeat when it comes his way, De Palma drove his usual heady race over the Wauwatosa course near Milwaukee, true to the form that has established his reputation as one of the foremost racing drivers of the country, if not of the world. Piloting the same Mercedes car with which he won the Elgin race, and so nearly won the 500-mile race on the Indianapolis Speedway last May, De Palma won from a field of eight starters in 4:20:31.54, just a fraction more than 42 seconds ahead of Hughie Hughes in a Mercer special, who had driven a consistent race throughout and who on more than one occasion appeared the probable winner. It was a grand struggle between the two.

De Palma's time figures out at the average of 69.4 miles an hour for the 299 miles, and though this is about 5 miles an hour slower than Ralph Mulford drove when he won the last Vanderbilt cup race at Savannah last year, part of the discrepancy at least can be charged to the condition of the course, which was not of the best, and part undoubtedly can be charged to the fatal accident to Bruce-Brown in practice the previous day. Brown was universally liked by all the drivers, and because of his accident the remaining drivers practically had agreed not to attempt record smashing.

That De Palma's victory was due to his consistent driving and consummate generalship is revealed by the fact that throughout the race he never attempted to force the pace. Teddy Tetzlaff, driving a Fiat, as usual, did all the forcing, and before he was forced out in the 26th lap, had opened up a lead on De Palma of something over six minutes. But the terrific pace he had set—he is credited with having made the fastest single lap of the day, a circuit of 7.88 miles in 6 minutes 15 seconds, which is at the rate of 75 miles an hour—told on his car toward the end and he retired when 4 minutes ahead of De Palma with burned out bearings. Almost from the first, Tetzlaff led the field and his driving was the feature of the day. Spencer Wishart, driving his own Mercedes, was third, and fourth place went to Gil Anderson in a Stutz. Only these four drivers finished.

Mulford, on whom great hopes had centered by reason of the speed of his giant Knox and his experience in previous Vanderbilt races, was the first to retire. Before he had finished three laps he quit, and it was reported that magneto trouble had caused his withdrawal. At that time Tetzlaff was leading by a comfortable margin, with Wishart and De Palma seesawing for second place, Hughes an easy fourth and the others trailed out astern. Practically the same formation was preserved up to well past the middle distance, when Tetzlaff was forced to stop for tires. De Palma also had made several stops, and though Wishart made a game bid for second place, once or twice passing De Palma, he was unable to hold the pace. Hughes in the meantime had been driving consistently and fast and was right on the heels of De Palma. Anderson in the Stutz and Nelson in the Lozier entry were in the background. Apparently, Nelson never had a chance, for he suffered engine trouble and soon after the 200-mile mark was passed was some 10 laps behind the leaders. George Clark, in the third Mercedes, also had experienced trouble and was never a dangerous contender.

RALPH DE PALMA

When the 250-mile mark was passed, and with only 49 miles more to go, De Palma was leading Hughes in his Mercer by only 45 seconds, and from then on the race developed into a duel between these two, with Wishart third and Gil Anderson fourth. Nelson, in the Lozier, was so far in the rear that his hopes of winning were exceedingly slim. But though Hughes gave De Palma a hard fight, that at any moment gave promise of developing into a winning fight, he was not able to cut down the 45-second lead that separated him from the slim Italian, enough to give him a real chance at the laurels.

Of the 10 drivers who originally had entered, but eight came to the starting line, neither Charles Merz, who was scheduled to drive a Stutz, nor Pullen, whose entry was a Mercer, putting in an appearance. The complete list of starters and the order in which they finished is as follows:

Driver and Car.	Time.
1. Ralph De Palma, Mercedes	4:20:31.54
2. Hughie Hughes, Mercer	4:21:14.34
3. Spencer Wishart, Mercedes	4:36:35
4 Gil Anderson, Stutz	4:39:40
5 George Clark, Mercedes	4:51:39
6. Harry Nelson, Lozier	Out in 26th lap
7. Teddy Tetzlaff, Fiat	Out in 26th lap
8. Ralph Mulford, Knox	Out in 3d lap

By winning the race, De Palma increased his bank account by something over $4,000, of which $3,000 represents the first prize and the remainder the "inducements" offered by accessory manufacturers. His Mercedes car was sparked by a Bosch magneto, was carried on Michelin tires and the "mixture" was furnished by a Rayfield carburetter. Hughes, who was second, drew down $2,000 for his share of the prize money, Wishart got $1,000 and Gil Anderson got $500.

Despite the 10 days' postponement and the general ill luck that has followed the contest since it originally was scheduled for the Milwaukee course, no dampening of ardor was apparent in the crowds that assembled around the course. The grandstands filled early and only the excellent policing prevented the thousands of spectators from crowding past the side lines and spilling over onto the course. Weather conditions were excellent. The day dawned bright, and long before 11 o'clock, when De Palma was sent away to lead the field, sunshine had tempered the otherwise chill breeze that blew out of the southeast and dissipated the smoke of the cars.

BURMAN NEAR TO RECORD ON ST. LOUIS DIRT COURSE

Drives Mile in 47 3-5 Seconds, But as Stop-Watches "Don't Count," It Means Nothing—Proves "Lion," as Usual.

Robert Burman, who has been consistently smashing records all over the country, under the apt guidance of E. A. Moross, almost smashed another one on Saturday last, 29th ult. Only the fact that the timing was done with ordinary stop watches instead with the electrical timing device prescribed by the American Automobile Association saved the record.

The trial was made in St. Louis on the new State Fair Grounds mile track and was part of the program which Moross had prepared and which was long enough to stretch over two days. Burman drove the mile in his 300-horsepower Benz in 47⅗ seconds, which is just one-quarter of a second faster than his own one-mile world's record made at Brighton Beach, New York, on Labor Day.

On the second day, he drove even faster, and was clocked for the mile in 46 seconds flat. But neither will constitute a record, for the reason that has been stated.

Burman did other things as well, of course. For instance, he won the Remy Brassard in straight heats, which feat ought to be second nature by now, for only once or twice has he permitted the celebrated "meal ticket" to slip through his fingers. Harvey Ringler, in a Mercer, and Raimey, in a Cino, were the other of Moross's string who showed in the limelight. The summary:

Five miles, class C, under 450 inches displacement—Won by Raimey, Ohio; second, Harvey Ringler, Mercer. Time, 4:02.

Five miles, class C, under 600 inches displacement—Won by Robert Burman, Cuttin; second, Savin, Ohio. Time, 4:02.

Three miles, for Remy Brassard and Trophy—Won by Robert Burman in straight heats. Time, 3:19⅕, 3:06½.

One mile exhibition by Robert Burman (Benz)—Time, 48⅘ seconds.

One mile exhibition by Robert Burman (Benz)—Time, 47⅗ seconds.

Five miles, free-for-all handicap—Won by Robert Burman, Cutting (20 seconds); second, Savin, Ohio (scratch). Time, 4:55.

Indianapolis Racemeet Declared Off.

Owing to the fact that E. A. Moross had too many other pressing engagements, including a racemeet at St. Louis and several others in surrounding cities, to say nothing of the postponed Grand Prix race in which star Robert Burman is scheduled to appear, it was found necessary to call off the meet which was to have been held at Indianapolis on the 28th ult. It was to have taken place on a one-mile dirt track and not on the Speedway.

Speedway Race to Stimulate Small Motors.

Unless a hitch of some kind develops, which is not likely, the next 500-mile race on the Indianapolis Speedway, which is scheduled for May 30th, 1913, ought to serve as a material stimulant to manufacturers to develop the motor of medium power, for the conditions which have obtained in the past have been changed so as to make the long grind essentially a contest for cars in the medium power class.

Under the new conditions, which just have been issued by director of contests Chas. W. Sedwick, only cars with less than 450 cubic inches piston displacement will be eligible; this year and the year before, the limit was 600 cubic inches. Incidentally, the minimum weight restriction has been reduced from 2,300 pounds to 1,600 pounds. As was the case last May, the field will be limited to 30 entries, which must be in the hands of the promoters between the dates of January 1st, when the lists open, and May 1st, when they close. Otherwise, the conditions are much the same as have obtained in the past, eligibility requiring that a speed of at least 75 miles an hour be demonstrated for a complete lap of the 2½-mile oval.

On the day following the big event it is planned to hold a series of shorter races, tentative arrangements scheduling either the Wheeler & Schebler trophy, the Prest-O-Lite trophy or the Remy Brassard for competition as the principal feature. Incidentally, an attempt will be made to obtain a number of notable foreign entries.

Dealers to Back New York Racemeet.

The Motor Dealers' Exhibit Co., which is composed of George Robertson and a number of other New York City automobile and supply dealers, has arranged to stage a racemeet on the Brighton Beach track, Brooklyn, N. Y., on Saturday afternoon, October 19th. A sanction for the event has been issued by the American Automobile Association and the entry blanks will be out the first part of next week.

Physician Heads Illinois Club.

The Clinton County Automobile Association has been formed in Carlyle, Ill., and the following officers have been elected: Dr. J. J. Marony, president; Joseph Schaefer, secretary; A. M. Leonhardt, treasurer. One automobile owner from each of the surrounding townships will be named as vice-presidents.

DISBROW TROUPE DISPLAYS PACE ON DETROIT TRACK

Disbrow Himself Displays Most of It by Taking Four of Seven Events Also Turns a Fast "Fifty."

Louis Disbrow, who is emulating certain other worthy gentlemen, visited the State Fair track in Detroit, Mich., on the 29th ult., with his following of racing drivers and cars. And even if his followers did not do anything very startling, Disbrow distinguished himself by winning four of the six events.

The piece de resistance of the meet, which was held under the auspices of the Michigan State Agricultural Society, was a 50-mile time trial, and of course it was Disbrow who turned the trick. Driving the Simplex with which he has done such good execution of late, he negotiated the 50 laps over an indifferent course in the excellent time of 45 minutes and 32 seconds. Inasmuch as the best previous time for the distance stands at 47:21.65, where De Palma set it last September at Syracuse, driving the very same car, it is altogether likely that Disbrow will be allowed another new record to his string. The remainder of the meet furnished mediocre sport at best, none of the races being closely contested, and few of them developing anything like real speed. The summary:

One mile time trial, free-for-all—Louis Disbrow (Simplex), time, 51⅕ seconds; Kilpatrick (Hotchkiss), time, 58⅘ seconds; Wm. Endicott (Case), time, 59⅗ seconds.

Five miles, class E—Won by Ulbrecht (Case); time, 1:53⅗.

Two mile time trial by Louis Disbrow—(Jay-Eye-See), time, 1:53⅗.

Five miles, class E—Won by Wm. Endicott (Case); second, Ulbrecht (Case). Time, 5:09.

Two mile handicap, free-for-all—Won by Louis Disbrow (Simplex), from scratch; second, Kilpatrick (Hotchkiss), ¼ mile. Time, 1:55.

Five miles, free-for-all—Won by Louis Disbrow (Case); second, Wm. Endicott (Case); third, Ulbrecht (Case). Time, 5:14⅘.

Five mile handicap, free-for-all—Won by Ulbrecht (Case), 10 seconds; second, Wm. Endicott (Case), five seconds; third, Kilpatrick (Hotchkiss) scratch. Time, not not taken.

The frayed ends of stranded conductors are decidedly dangerous as producers of grounds and short-circuits, which often are difficult to detect.

SCARCITY OF ENTRIES SNUFFS OUT GLIDDEN TOUR

Its Formal Abandonment by A. A. A. Not Unlooked For—Manufacturers and Southern Owners Alike Proved Lukewarm.

The ninth annual national reliability tour of the American Automobile Association, better known as the Glidden tour, is off. Once before—last year—it was called off, but it was at once "rescued" and called on again. This year, however, there will be no restoration, though it is promised that strenuous efforts will be made to revive it next season. The fate of the tour was decided yesterday, Wednesday, at a meeting of the touring board of the A. A. A. held in New York City. The decision to abandon the contest was made because of lack of entries, which it was known had been causing serious misgivings—even when it was bravely announced that it might become necessary to limit the number of starters to 100.

The abandonment of the contest is in no wise surprising, as up to last week but 15 entries had been received and neither the postponement of the starting date from October 7th to October 14th, nor the efforts of W. J. Morgan and J. A. Hemstreet, who were sent by the A. A. A. to Detroit and New Orleans, respectively, to endeavor to swell the entry list, proved availing in adding to the number already "signed up." The Detroit manufacturers could not be induced to "warm up" or display real interest, while Southern entries which had been promised dissipated in thin air and could not be found when sought for.

Even though enthusiasm for the tour has not been at fever heat in the factories, such has not been the case along the route which had been laid down from Detroit to New Orleans. In many of the Southern cities through which the tourists were scheduled to pass the mere fact has been sufficient to stimulate the movement for good roads and even if the tour has been abandoned, its promotion will not have proved wholly vain

A. A. A. Reinstates One and Denies Two.

In addition to Joe Dawson and L. E. Stuart, his manager, F. E. Radina, of Cincinnati, Ohio, has been reinstated by the A. A. A. contest board. Like the other two, Radina had been disqualified for competing in an unsanctioned race meet. Andrew Burt, of Chicago, who automatically had disqualified himself by similar and related offenses, was definitely suspended until January 1st next Harry S. Moore, the Cleveland (Ohio) agent for Stutz cars, was disqualified for a similar period for advertising performances of Stutz cars at Indianapolis and Elgin as being performances of "strictly stock cars, the same as you buy." The Schacht Motor Car Co., of Cincinnati, which on August 1st was disqualified until January 1st for advertising of a similar nature applied for reinstatement, which, however, was denied by the A. A. A board, as was the application of Theron Duby, who, in December, 1911, was suspended for two years for competing in an unsanctioned race meet at Dewitt, Iowa, under the assumed name of Bliss.

Cincinnati Repeals Bulb Horn Law.

Cincinnati, which is the only city of any size in the United States which up till recently has permitted the use of only old-fashioned bulb horns, finally has brought itself abreast of the times by repealing the bulb horn law which had been in force since Dec. 14, 1903. The superseding measure, which prescribes only that "it shall be unlawful for any person to use a signal device which will not produce an abrupt sound sufficiently loud to serve as an adequate warning of danger," is similar to the ordinances adopted by St. Louis, Chicago and Newark and other large cities.

Automobile Ideas in Horse Drawn Rigs.

There is no doubt that motor cars started out by borrowing ideas from carriage construction; but the time seems to have come when the borrowing is going the other way, as is indicated by the fact that at least one firm is building sleighs with doors similar to those on motor cars and calling them "fore-door sleighs." Glass windshields of the motor car type also are finding favor with users of horse-drawn carriages, while "automobile seats" have been in vogue for several years.

When Chains Will Not Prevent Skidding.

While chains prevent skidding in a majority of cases, they sometimes fail to do so. For instance, if the brakes are set too hard, so as to lock the wheels, the tires may come to a stop, resting on the ground between the cross chains, when they will skid quite freely. This is a strong argument in favor of properly equalizing the brakes and against the practice of locking the wheels with the brakes.

Benzol for Flushing Fuel Tanks.

It is worth knowing that any residue left by gasolene, and even fuller's earth, can be dissolved and washed out with benzol. It is good practice, therefore, to wash out tanks with benzol occasionally, flushing the gasolene line and the carburetter—the entire gasolene system—at the same time.

BRUCE-BROWN MEETS DEATH IN VANDERBILT PRACTICE

Wealthy Young New Yorker Victim of a "Blow-Out"—Had Foreboding of Evil and Had Almost Decided Not to Drive.

David L. Bruce-Brown, whose reputation as a racing driver was made in a number of important events both here and abroad, and whose fame was spread far and wide when he won the Grand Prix race at Savannah two years in succession, was killed in practice for the Vanderbilt cup race near Milwaukee, Wis., on Tuesday, 1st inst., and his mechanician, Tony Scudalari, was probably fatally injured.

The accident which resulted in Brown's death was caused by the blow-out of one of his rear tires and occurred after he had made several fast laps of the course, of which he had a poor opinion. One day last week, in speaking of the course to a Motor World man, he decried its condition and declared that it was such a menace to life and limb that he would not drive on it. But he changed his mind and his death resulted. Although he had never been in a serious accident, he had a premonition that something might happen during the race for several days previous to its running he requested his family physician to accompanying him to Milwaukee to be on hand in the event of trouble.

Brown, who was only 26 years old and wealthy in his own right, was an unusual type of driver. He was gently born and gently reared, and it always has been more or less of a conundrum why he turned professional and took an active part in such a business. But his love for the sport was manifested early, and from motorcycles he soon graduated to motor cars. He first sprang into prominence as a racing driver in 1908, when after running away from school he competed in a series of events on the Florida beach and established a one-mile amateur straightaway record of 33⅗ seconds. Since then he has taken part in nearly every race of importance, his most recent feat being the capturing of the first leg of the Grand Prix race in France a few months ago. He was a big, strapping, fine looking specimen of young manhood, who lost as gracefully as he won.

When the Wheels Are Going Around.

When a car with 36-inch wheels is moving at the rate of four miles an hour, the wheels are turning at the rate of 37 revolutions per minute; at 10 miles an hour the wheels turn 93 revolutions per minute, and at 25 miles, 245 revolutions per minute.

DIESEL TYPE OF ENGINE IN FARM TRACTOR FIELD

British Manufacturer Produces "Semi-Diesel" That Does Excellent and Economical Work—How It Operates.

Whatever may be the future of the Diesel engine for road vehicle propulsion, and it certainly appears to be a bright one, at least a start has been made and according to present indications it is a very substantial start, indeed. Dr. Rudolph Diesel himself has said that within a year at most Diesel-engined commercial vehicles would be seen on the roads, and it is fairly well known that his experiments with a Diesel-engined railroad locomotive are so far advanced as to have warranted exhaustive tests by wealthy and influential German railroad interests.

Within the past few weeks a British firm, Walsh & Clark, Ltd., of Guiseley, Leeds, Eng., after years of quiet development, has brought out and placed on the open market, a Diesel-engined agricultural tractor, which under test has shown surprising efficiency and which well may be expected to serve as the thin end of the wedge which will open up a wide field for this most modern form of prime mover. It is true that Walsh & Clark's tractor employs what has come to be known as a "semi-Diesel" engine, but it nevertheless is a Diesel engine operating on the Diesel principle, and so far as is known it represents the first practical application of this form of power to a road vehicle. Up to the present time but one of these vehicles has been constructed, but the results which have been obtained with it and its remarkable fuel economy and general efficiency leave little room for doubt regarding its future production in quantities.

Cheapest Oil Fuel is Utilized.

As everyone who knows anything about Diesel engines is aware, the motor will thrive on thick sirupy oil as black as a hat and nearly as repugnant as the slime that collects at the bottom of stagnant pools. The fuel virtually is the residue after practically all of the good has been extracted from the crude petroleum. And as it is the residue, its price is proportionate. At present it can be purchased at five or six cents a gallon in almost any quantity. And not only does the Diesel engine consume almost the cheapest of fuels, but its wants are extremely moderate; a little more than half a pint per brake horsepower hour is all it requires. All of which tends to make plain the very evident economy of this form of power. The thermal efficiency of the Diesel engine—that is to say the proportion of power developed from the actual number of heat units in the fuel—is higher than it is in any other known form of prime mover.

The motor in the Walsh & Clark tractor is of the two-cycle type, and has two cylinders opposed to each other and measuring 9 inches bore and 12 inches stroke. The indicated horsepower is 70. Cast integral with the cylinders there is an immense water tank, water being employed to ensure the proper cylinder temperature. The water is circulated through a vertical tube radiator by means of a plunger pump and three fans serve to force a cooling draft over the pipes.

Operation Without Ignition Apparatus.

The cycle of operations of the motor is exactly the same as obtains in the ordinary two-cycle engine, with the exception that no ignition apparatus is employed. The outward stroke of the piston is the power stroke, of course. About two inches before the piston reaches bottom dead center, the exhaust port in the cylinder liner is opened. As the exhaust gases are under pressure they escape through the port while at the same time, or rather a fraction of a second later, the admission port opens and pure air compressed to approximately three pounds pressure in the crankcase is admitted and assists in scavenging the burned charge. The air then is compressed to about 170 pounds pressure and at or near the top of the stroke the liquid fuel is forced into the combustion chamber by means of a pump, the fuel being under approximately 450 pounds pressure. Immediately it enters the chamber it explodes spontaneously by reason of the high temperature and the cycle of operations is repeated. Speed variations are obtained by altering the amount of fuel admitted, the stroke of the oil pumps—there is one for each cylinder—being varied by means of an eccentric and link movement for this purpose. Another interesting feature is that just prior to the admission of the fuel, water is sprayed into the combustion chamber, the effect being to reduce the temperature and thus to reduce the tendency to pre-ignition. Incidentally the injection of small quantities of water assists the more complete combustion of the mixture and makes for smooth operation.

Compressed Air an Important Factor.

As is the case with all Diesel engines, compressed air forms a valuable adjunct to the operation of the motor. The air is compressed by a small pump operated from the camshaft to 180 pounds pressure and then is utilized for starting the motor and for increasing the average pressure on the pistons. It is necessary in starting, of course, to heat the combustion chambers and heads thoroughly, and for this purpose two small kerosene blow lamps are provided. The operation requires not more than five minutes, however, and scarcely can be termed a drawback. The normal speed of the engine is 320 revolutions a minute.

In regard to the remainder of the tractor, there is nothing really startling in its make-up. The engine drives the rear wheels through the intermediary of a three-speed selectively operated change gear mechanism which gives 1.8, 2.5 and 5 miles an hour, respectively. Final drive is by means of the orthodox side chains. The clutch is of the single flat plate type and is faced with frictional material. As the engine, in common with nearly all two-speed engines is readily reversible, no reverse speed in the change gear mechanism is necessary.

Extent of Ford's English Production.

According to P. L. D. Perry, its manager, the Ford factory, in Manchester, England, produced and sold 3,200 cars in Great Britain during the past season, which is a greater number than was sold by the next three largest British automobile producers. Perry, who last week sailed for Manchester after a visit of several weeks to this country, estimates that the Ford plant on "the other side" next year will build 6,500 cars for the British market alone, and, approximately, 3,500 more to meet the European demand.

Hot Soldering Iron to Start Screw.

The application of a good hot soldering iron to the head of a small screw that is hard to start will sometimes help matters by disturbing the rust between the metal surfaces. An overnight soaking with kerosene, following the use of heat, will loosen all but the very worst cases.

Charcoal for Valve-Grinding Purposes.

A fine finish can be given to valves, when grinding them, by the use of powdered charcoal—just ordinary charcoal. This substance cuts rather slowly for heavy grinding, but makes a fine finish.

Water Not Good for Bronze Bearings.

A bronze bearing that runs hot never should be cooled with water. If it is not possible to wait for the bearing to cool naturally, which of course is the best thing to do, use oil for the purpose.

Pure nickel is the only common metal besides iron that is attracted by a magnet. It is much less susceptible to magnetic action, however, than iron.

Digitized by Google

1,016,723. Automobile Tag Holder. William B. West, Philadelphia, Pa. Filed April 5, 1911. Serial No. 619,066. (Cl. 40—10.)

A support for automobile number plates comprising a channeled standard, an arm of channel section carried thereby, a plurality of resilient means one of which is connected with the standard and the other with the arm and both adapted to engage a number plate and hold said plate in said channel members, and means to secure said support to an automobile frame.

1,016,726. Lamp Adjusting Mechanism. Joseph Andzik, Dayton, Ohio. Filed Sept. 22, 1911. Serial No. 650,670. (Cl. 240—62.)

1. A combination with a steering mechanism of a motor vehicle, of a vertically disposed shiftable shaft actuated by said mechanism, a holder fixed to and movable with said shaft, oppositely disposed angle-shaped arms movably mounted in the upper portion of said holder and adapted to support a lamp, and a weight arranged within the holder and connected to said arms for normally maintaining the arms vertically.

1,016,871. Resilient Wheel. Howard Wilbur Brooks and Smith Frederick Krupp, Memphis, Tenn. Filed April 21, 1911. Serial No. 622,470. (Cl. 152—28.)

1. A resilient wheel comprising a hub, a plurality of spokes radiating therefrom and on opposite sides thereof, rims secured to the outer ends of the said spokes, bolts extending from the spokes on one side of the wheel whereby the rim is positioned thereon, a U-shaped tire positioned between the said rims, a plurality of alining openings in each side of the tire, a plurality of thimbles carried by the said tire, each thimble being positioned by engagement in one pair of said alining openings, the said bolts connecting the said spokes and rims extending through the said thimbles and being normally out of engagement therewith, together with a number of springs each in engagement at one end with the hub and at the other end with the said thimbles whereby the said tire is resiliently mounted with respect to the hub.

1,016,895. High Tension Magneto Ignition Apparatus for Internal Combustion Engines. Alexander Marcus Patton, Belfast, Ireland, assignor to Chambers Motors Limited, Belfast, Ireland. Filed April 6, 1909. Serial No. 488,278. (Cl. 123—149.)

A driving connection of the type referred to comprising in combination a driving shaft, a driven shaft, a lever upon the driving shaft, a sleeve mounted upon the driven shaft, a spring having one end connected with the driving shaft and the other end connected with said sleeve, a stationary hollow ratchet, a pawl within said ratchet and pivoted upon the aforesaid sleeve, a weight connected with said pawl and adapted to be engaged with the aforesaid lever on the driving shaft for the purpose of releasing the pawl from the ratchet and a stop upon the sleeve for engaging said lever, substantially as and for the purpose hereinbefore set forth.

1,016,896. System for Inflating Pneumatic Tires. Charles A. Rivers, Denver, Colo. Filed March 13, 1909. Serial No. 483,259. (Cl. 152—11.)

1. In an apparatus for inflating pneumatic tires, the combination with a wheel and its pneumatic tire, of a cap fixed upon the wheel hub and including an interior, normally closed chamber in communication with said tire and having an axial opening in its outer end, an interior recess surrounding the same and a cavity corresponding with said opening in its opposite end, a longitudinally bored head fitted in said cavity and having a passage connecting the bore with the interior of the chamber and an integral collar occupying said recess, a washer connected with said chamber covering the joint between the collar and the recess, a second washer similarly connected in frictional engagement with the circumferential surface of the head and a conduit extending outside of said cap, fixedly connected with the head in communication with its bore.

1,016,905. Vehicle Spring. John S. Thiell, St. Louis, Mo. Filed Aug. 12, 1910. Serial No. 576,825. (Cl. 21—103.)

A vehicle spring comprising a series of leaves, said leaves having a zigzag groove in the upper faces thereof, a centrally disposed bolt extending through all the leaves for connecting the same together, said bolt having grooves in the opposite sides of the shank portion thereof, said grooves communicating with the zigzag grooves in the leaves of the spring, and a lubricator cup connected to the end of said bolt for feeding oil through the grooves in the shank of the bolt and to the zigzag grooves, essentially as described.

1,016,906. Tachometer. Curtis Hussey Veeder, Hartford, Conn, assignor to The Veeder Manufacturing Company, Hartford, Conn., a Corporation of Connecticut. Filed March 24, 1911. Serial No. 616,773. (Cl. 73—123.)

1. In an instrument of the character described, the combination of an indicator tube, a casing having a main chamber and a pump chamber communicating with the main chamber and with the indicator tube, an impeller in said pump chamber with its axis vertical, an open ended tube secured at its lower end in the bottom of the pump chamber, a central shaft extended upward through said tube, a sleeve shaft, and means to connect said sleeve shaft to said central shaft above the upper end of said tube said sleeve shaft supporting the impeller at its lower end.

1,016,918. Method of Making Pneumatic Tires. William W. Duncan, Watertown, and Arthur N. Hood, Newton, Mass., assignors to Hood Rubber Company, Boston, Mass. Filed Aug. 22, 1910. Serial No. 578,341. (Cl. 154—14.)

The herein described method of manufacturing pneumatic tires which consists in forming a tire body of fabric and uncured rubber, separately rolling a strip or band of uncured rubber with an embossed surface, applying said strip or band to the periphery of said body, and thereafter subjecting the tire to the "open heat" vulcanizing treatment, substantially as described.

1,016,980. Controlling Device for Electric Motor Vehicles. Elmore W. Bender, Los Angeles, Cal. Filed July 13, 1910. Serial No. 571,704.

1. In combination, a direct current electro-mechanical machine adapted to act either as a motor or generator and an electric motor mechanically connected together, a controller for the direct current machine, a mechanical clutch connected to the direct current machine, and connective means whereby the clutch and controller are actuated simultaneously.

1,016,981. Internal-Combustion Engine. Ray Carmichael, Indianapolis, Ind., assignor to Indianapolis Gas Engine Company, Indianapolis, Ind., a Corporation. Filed Mar. 6, 1911. Serial No. 612,554.

1. An internal combustion engine provided with a fan-shaped combustion chamber, an oscillatory hollow piston operating therein, ignition means in said chamber, means for conveying the combustible mixture into said piston, and valve-controlled ports in said piston for charging the combustion chamber.

1,016,991. Elastic Tire. Carl Herold, Brunn, Austria-Hungary. Filed Sept. 3, 1910. Serial No. 580,288.

In an elastic tire, the combination with the inner rim of an outer resilient rim of greater diameter, a number of strips of fabric broader than and stretched around the said rim and having their protruding borders so plaited in triangular folds and secured to each other as to form with the rim an inwardly open gutter and means for fastening the said borders to the inner rim, substantially as and for the purpose described.

1,017,000. Vehicle Lamp. Joseph A. Joncas, Minneapolis, Minn. Filed May 17, 1910. Serial No. 561,860.

1. In a motor vehicle, the combination, with a frame of brackets mounted thereon, plates having ball bearings on said brackets, and having lock nuts and springs provided on said bolts between said nuts and said brackets, lamps carried by said plates, said plates having laterally extended slotted arms, a rod having its ends connected to said arms in said slots, a steering apparatus and means operatively connecting said rod with said steering apparatus.

1,017,008. Engine. William Riley McKeen, Jr., Omaha, Neb., assignor to McKeen Motor Car Company, Omaha, Neb., a Corporation of New Jersey. Filed Aug. 21, 1909. Serial No. 513,915.

1. In apparatus of the nature described, in combination, a cylinder head having air inlet and discharge passages extending laterally into the head and thence into the cylinder; a central opening for the passage of a piston rod; water chambers intermediate the air passages; an inlet opening into the first of said water chambers; an outlet opening from the last of said chambers; and a raised circular projection adapted to extend into the cylinder, and containing passages connecting the water chambers in series, substantially as described.

1,017,070. Gearing. Alfred Andri, Liege, Belgium, assignor to Fabrique Nationale D'Armes de Guerre Societe Anonyme, Herstal, Belgium. Filed Nov. 17, 1909. Serial No. 528,474.

1. The combination with a gear-set of fixed and movable gear members, and a clutch device of a lever having a fixed pivot, connections between the lever and the gear-set for shifting the movable gear members upon swinging the lever, a second lever pivoted on said lever beyond its axis connections between the second lever and the clutch device, a stationary locking member positioned to be engaged by the second lever, and an operative connection between the two said levers.

Dealers!!!

The Cash Prizes Offered by MOTOR WORLD in the Used Car Contest

For Your Ideas—How You Suggest the Greatest Success Be Attained—Your Criticisms of Present Methods.

The Cash Prize Used Car Contest is in no sense a literary contest and no article will be judged by the amount of correct English or pure rhetoric with which it is constructed.

The articles may be long or short and "literary style" will not figure in the award. Practical ideas, and preferably plans which have been put into practice and proved true, are what are desired. The policy pursued by the small dealer is likely to prove quite as valuable as that brought to bear by the large one.

How Do You Overcome the Used Car Evil?

How do you keep it from standing between you and the profit you ought to earn through the sale of a new car? That's what we want to know, so

Just Give Us the Facts. We Will Write the Article

if you say so, and put it in shape for publication. Of course, we will print your letter just as you write it unless otherwise ordered, but we are willing to help you put it in good shape if you think we ought to do it.

We want to co-operate with dealers by giving full publicity to the ways and means adopted by them in overcoming the profit-killing influence of the car that is being sold and re-sold to the detriment of new car sales.

The Cash Prizes Are Worth Trying For

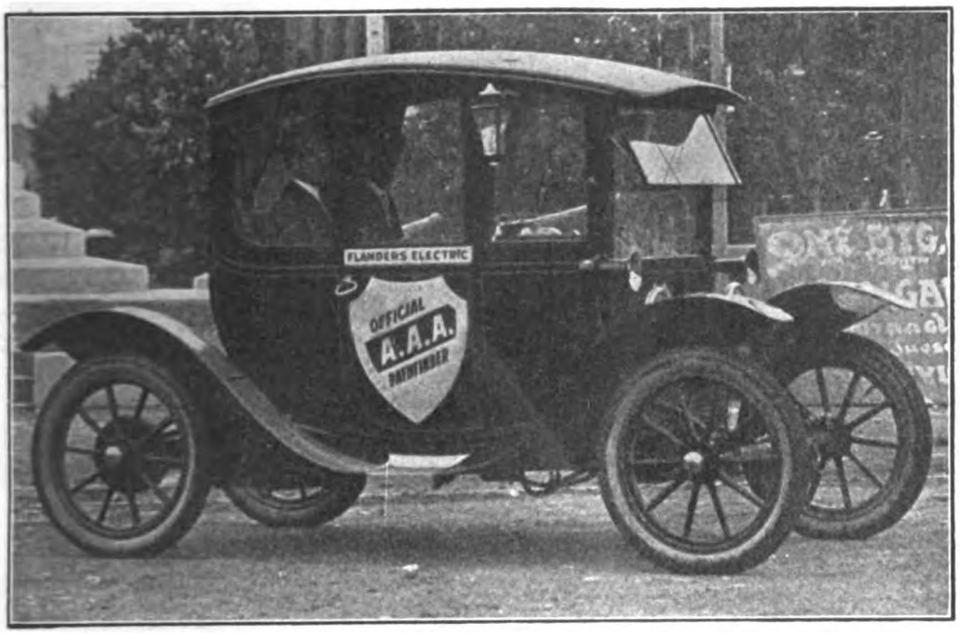
But the greatest good will come to you through the exchange of ideas of dealers all over the United States, many of whom doubtless have partially or wholly mastered the situation. It's up to you to help, and your plans may win you one of the following sums of money:

$50 for the best article on
$25 for the second best article on
$15 for the third best article on
$10 for the fourth best article on

How to Handle the Used Car Problem

This Offer Is Open to All

and communications from Motor World non-subscribers will receive the same consideration as those from subscribers. There are no strings to the proposition. We will spend this money for the remedy and we don't care who the doctors are.



Contest Closes January 2nd, 1913

and on this date the following judges—Carl H. Page, of The Carl H. Page & Co., metropolitan distributors of Chalmers cars; William Colt, of Colt-Stratton Co., Eastern agents Cole cars; and Harry Houpt, general manager American Locomotive Co., manufacturers of Alco Cars and Trucks—will take all contributions into consideration, announcing the winners in Motor World, issue of February 6th, 1913.

We want your co-operation for our mutual benefit and for the betterment of the trade in general. Send us your letter—today.

Address Communications to Contest Editor, MOTOR WORLD, 1600 Broadway, New York

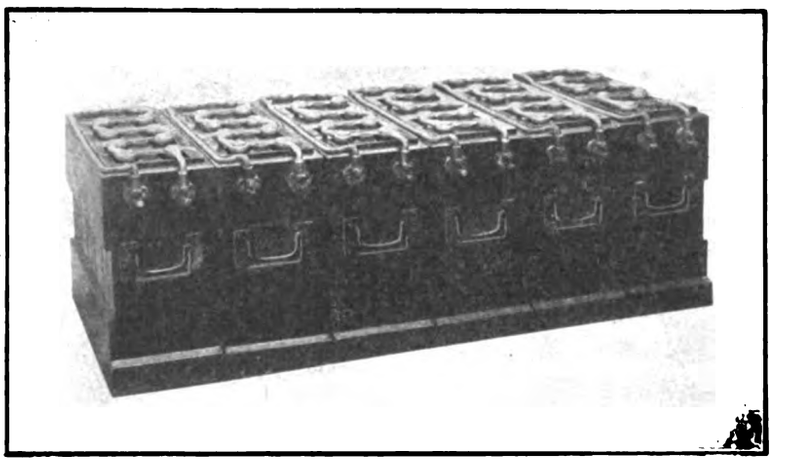
This is the Car



that made the wonderful Path Finding trip for the 1912 Glidden, or National Reliability Tour.

1721.7 Miles

From Detroit to New Orleans

arriving at latter city on exact schedule time.

This is the LBA WILLARD Electric Vehicle Battery

that contributed to the success of this wonderful performance, an achievement never before attempted or considered within the range of possibility for an electric.

It was, by no means, a boulevard trip. Over roads of every description, in drenching storms, through mud and mire, up hill and down, successfully overcoming difficulties calculated to daunt the most powerful gasoline car—the LBA battery propelled the Flanders Path Finder and demonstrated the thorough reliability of the Electric under every condition of service.

Great credit is due to the manufacturers, whose faith in their car was proven well founded, but the supreme confidence which prompted them to embark upon this stupendous undertaking was inspired by their intimate knowledge of the absolute dependability of LBA batteries.

Give Your Customers the Big Message!

PENNSYLVANIA Oilproof Vacuum Cup Tires

Oil disease is sure and early death to tires—and it's the oil on garage floors, big city streets and, in many localities, oiled roads that put the tire in the scrap heap before half of its useful life should be spent.

PENNSYLVANIA OIL PROOF VACUUM CUP TIRES are the first and only tires to prove themselves immune to oil infection—and they are also anti-skids of the safest type. Note the vacuum cups on the big illustration.

DEALERS: Here Are Your Selling Points

Long Life Oil Can't Disintegrate Them. Chains Can't Chew Them Up.

Safety Guaranteed to Hold on Slippery Surfaces—Without Chains.

Get in line—now—before the territory is invaded. It's good business.

PENNSYLVANIA RUBBER CO., Jeannette, Pa.

(Re-organized Feb. 1, 1910)

Pittsburgh, 505 Liberty Ave.
Kansas City, Mo., 514 East 15th St.
Minneapolis, 34 South Eighth St.
Chicago, 1004 Michigan Ave.
Detroit, 254 Jefferson Ave.

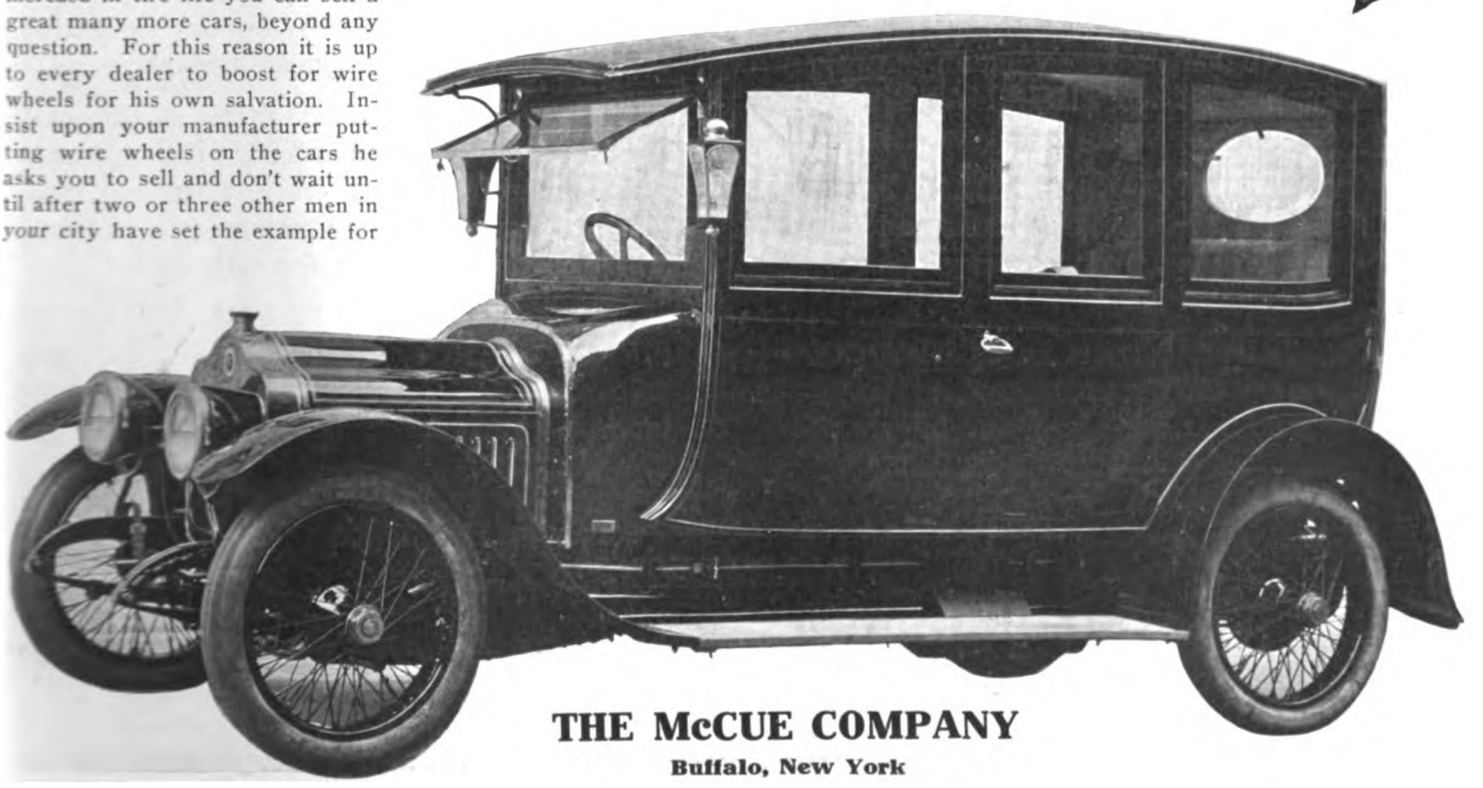
HENRY FORD Bought THIS WIRE WHEEL MINERVA For His Own Personal Use

70% MORE TIRE MILES

WIRE McCUE WHEELS

It is not alone in tire economy that wire wheels excel, but as well in their ability to make cars more easy riding and more easily controlled.



Wire wheels on the big sumptuous Minerva limousine, such as is shown herewith, and which was bought by Henry Ford for his own personal use, mean an added comfort and smoothness that could not possibly be obtained with other than wire wheels.

Of course, the big factor to be considered by every dealer, regarding the question of wire wheels, is that they save tires—an actual six months' test by the English Daimler Company showing an increase of tire life of 68.75% where wire wheels were used as against wooden wheels.

If you can guarantee your prospects such a terrific increase in tire life you can sell a great many more cars, beyond any question. For this reason it is up to every dealer to boost for wire wheels for his own salvation. Insist upon your manufacturer putting wire wheels on the cars he asks you to sell and don't wait until after two or three other men in your city have set the example for you. Our extensive advertising campaign is acquainting the buying public with the fact that wire wheels are superior in every way over wooden wheels. That means that the public is going to demand wire wheels—that means that the man who sells a wire wheel equipped car will have the best chance of dominating the situation in his territory.

McCue axles are so constructed as to admit of the use of either wire wheels or wooden wheels on the same spindle. There is no reason in the world why you cannot have wire wheels on your cars.

For further information, write us.

"I Have Two Baby Carriages and One Wheelbarrow"

This was one response which came the other day from some letters of inquiry which we mailed to 3,000 readers of THE SMART SET on our subscription list asking if they owned automobiles.

In an effort to become better acquainted with our subscribers, we had been asking them a lot of questions regarding their literary tastes, their magazine preferences, how many magazines they took and what became of the magazines after they had finished with them—in the course of which we found that in the majority of cases THE SMART SET averages more readers per copy than any other magazine, being passed about from hand to hand among the whole family and then loaned to the neighbors.

Then we asked how many of our subscribers owned automobiles. The responses received were so surprising that we think it worth while publishing the results of the inquiry here.

Out of the names selected at random and addressed on the subject, 692 replies were received. Of this number, 473 acknowledged ownership of one car, 63 owned two cars, 27 owned three cars, seven owned four cars, four owned five cars, one owned six cars, two owned eight cars, two owned nine cars—and one subscriber was the owner of eleven cars! Eighty-five per cent. then, of the subscribers who answered our inquiry are automobile owners.

From the 112 who listed themselves as non-owners, the further remarkable information was received that 23 intend to buy cars this year, six will buy some time soon, eight expect to have cars soon, five hope to, 14 are thinking about it, four say they may get one, one wants a car, another has a particular car in mind, and one doesn't need a car as he has two friends who are going to become owners shortly. In all, out of these 112 non-owners, 93 put themselves in the class of possibilities.

Further, of those who already have cars, 18 state that they will shortly need new cars.

The above owned automobiles average 34.3 horsepower. A car of this horsepower may be said to average about $2,000 in cost, so an estimate may easily be made of the amount of money invested by these readers of ours in this particular form of luxury.

When out of a random selection of 3,000 names 673 are found to be in the automobile-buying class—some on a rather extensive scale—it shows an exceptionally high average of readers who are in a position to appreciate and acquire the best in life—and who should prove the very best customers for high-grade advertisers.

The real value of an Advertising Medium to the advertiser depends upon the purchasing capacity of its readers.

Every Manufacturer in the Automobile Industry Should Know These Facts

THEY ARE ABSOLUTELY CONCLUSIVE and reflect with unerring certainty the class of people which constitutes SMART SET circulation.

THERE IS NO THEORY, guesswork or deduction needed to demonstrate what an exceptionally favorable medium THE SMART SET is for successfully exploiting automobiles.

THE SMART SET HAS A LARGE NEWSSTAND SALE in the large cities and towns where the purchasing capacity is greater than anywhere else.

OUR SUBSCRIBERS ARE LARGELY CONFINED to the smaller towns, and it is unquestionably true that our newsstand buyers possess as high and probably much higher purchasing capacity than our subscribers.

THE CIRCULATION of THE SMART SET is at present 85,000 to 90,000 a month. It is a magazine appreciated by smart, cultured, brainy people. It is enjoyed by both sexes.

THIS IS THE CLASS which has made possible the astounding proportions of the automobile industry today. We are selling our magazine to the same people whom you are anxious to make customers for your cars.

THE ADVERTISING PAGES OF THE SMART SET will introduce you to those, who as a class not only own, but have the money to buy automobiles.

THE SMART SET
A MAGAZINE OF CLEVERNESS

offers automobile manuracturers a percentage of purchasing capacity per thousand not surpassed by any other medium in the world.

THE SMART SET, 452 Fifth Avenue, New York

"The Horn that's Made for the Discriminating"

TUTO HORN

THE TWO TONE HORN

Patented Features.

THE two-tone service features of the TUTO Horn are patented and can be furnished only in our product.

¶ This places the TUTO in a class by itself, making it the only device which does all of the signalling of the motor car in a simple and positive manner.

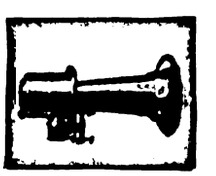
¶ It provides in the one horn and one button more effective signalling value than can be obtained by the best bulb horn, supplemented by the most expensive one-note electric horn.

¶ Neither of the latter is complete, for the inflexible loud blast of the one-note electric horn is out of place for regular service, making it a nuisance, promoting adverse legislation against all electrical signals, and in addition producing a paralyzing effect where rapid movement is most desired. Also the bulb horn is inadequate for emergencies.

¶ The TUTO Horn overcomes all of the disagreeable features in this complication of signalling devices and inappropriate signal notes.

¶ Remember that the TUTO Horn is the only electric horn that does all of the signalling of the car, that it can be furnished by no other manufacturer, as it is protected by our patents and that it requires no care or adjustment from one season to another.

¶ This makes the TUTO Horn best for standard equipment upon any car.



TUTO Horn, $25.00

Marion Model 37-A, Completely Equipped, $1475

1913 Marion 1913

This Splendid $1475 Car Abounds In Unusual Features

Disco Self-Starter
Prest-O-Lite Tank
Warner Speedometer
Concealed Tool Boxes
Robe Rail, Foot Rest
Tire Irons, Tire Kit

Dynamo Electric Lighting System
80-Hour Storage Battery
Ventilating Plate Glass Windshield
Q. D. Demountable Rims, one extra
Mohair Top, Boot, Storm Curtains, Tools, Pump, Jack

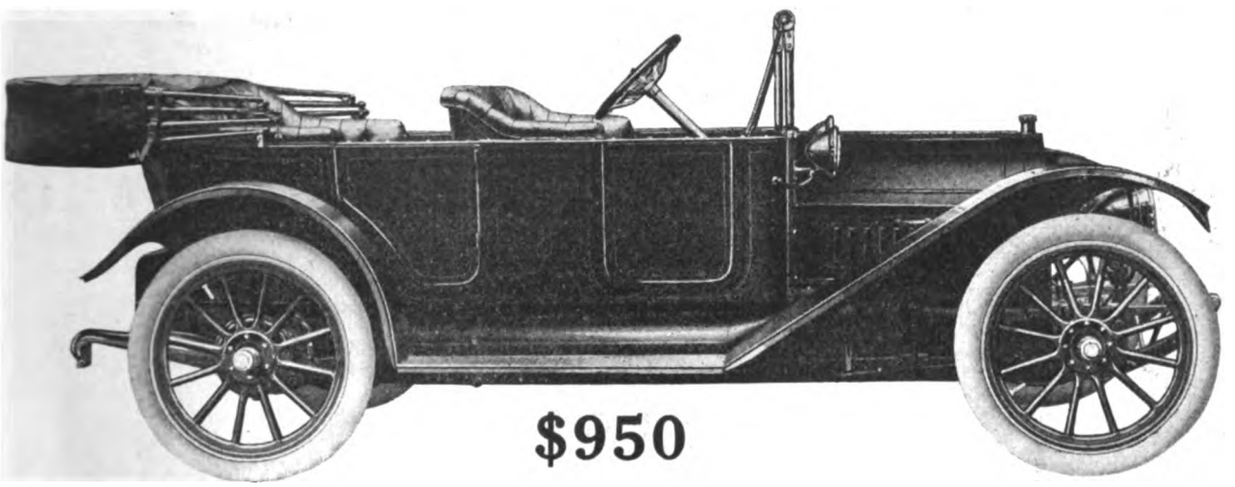
FINISH. Rich Brewster green or deep wine color; metal trimmings nickel plated; wood trimmings mahogany; lamps black enameled; fenders, hood, dust shields, baked enamel.

BODY. Five-passenger, big and roomy; graceful lines, flush sides; divided front seat; deep upholstering, hand-buffed leather; center control; all doors open towards front; deep cowl over dash; gasolene filler tube between front seats.

MOTOR. 30-40 horsepower; four cylinders, long stroke, cast in pairs; bore and stroke, 4 x 5 inches; large valves, valve springs enclosed; automatic carburetor, steering column adjustment; dual ignition, magneto and batteries; 3-point suspension; constant level oiling system (circulating).

CHASSIS. Wheelbase 112 inches; pressed steel frame; cone clutch, spring inserts; 3-forward speed selective transmission; shaft drive; front axle I-beam, rear axle double trussed; front springs semi-elliptic, rear ¾-elliptic, imported steel; four double acting brakes, large and effective; strong steering gear; artillery wheels; 34 x 4 inch tires.

Features such as these establish the Marion 37-A as a car of unusual value at such a moderate price. We cannot begin to tell you all about it here but our illustrated folder will give you further information. Write for one.



We offer to bona fide automobile dealers the fairest sales agreement ever written. Ask about it.

AMONG the crop of 1913 announcements, The Regal Model "T" Underslung Touring Car, with its added refinements, its equipment, its dollar-for-dollar consideration, its 1912 selling and service record, stands out as a striking example of advanced value and retarded price.

The Regal Model "T" Underslung Touring Car

The Specifications

Read Carefully

Wheel Base, 108 inches; Tires, Morgan & Wright, 32x3½ inches: Selective Sliding Gear Transmission, three speeds forward and reverse; Motor, Four Cylinders, cast en bloc; Bore, 3¾ inches; Stroke, 4½ inches; Dual Ignition; Thermo Syphon Cooling. Equipment includes nickel-plated trimmings; Electric Lights, with option of gas headlights, and Prest-O-Lite Tank; Electric Horn; Tools and Tire Repair Kit. Top, Windshield and Speedometer, $75 extra. Price $950.

Past Record

¶This car was a tremendous seller in 1912 as *all* our distributors and dealers will testify. Its record in owners' satisfaction was most enviable. With the additional equipment and refinements, we predict this car to outsell in any competition. *Your* judgment will sustain *ours*.

The New Atwater Kent Ignition System

With Automatic SPARK ADVANCE

DISTRIBUTORS

New York.....E. J. Edmond Co.
Chicago.....Motor Car Supply Co.
San Francisco, Chanslor & Lyon M. S. Co., Weinstock-Nichols Co.
Milwaukee.....Julius Andrae & Sons.
Omaha.....Omaha Rubber Co.
Chattanooga.....Sanford Bros.
Dallas.....Fisk Co. of Texas.
Denver.....Auto Equipment Co.

Of extreme interest to every motorist

THE Automatic Spark Advance feature of the Type "K" Atwater Kent System is a long stride forward in ignition practice.

With this device, the control of the spark timing is entirely automatic (although the hand lever can be used if desired). This means that the spark is always properly timed to get the greatest possible power from the motor at any speed from three to seventy miles per hour.

No human mind can follow accurately the speed variations in an automobile motor and accordingly regulate the spark setting to get the best results.

The automatic spark control of the Atwater Kent System is more than human in its performance—it is sensitive to the slightest variation in speed—immediate in its response and positive in its action. The operator can forget his spark lever, knowing that his spark is being better regulated than he can do it himself.

The increased safety due to the automatic retarding of the spark for starting is alone more than sufficient to commend it to the modern motorist.

The Type "K" System is especially adapted for use in conjunction with lighting and starting equipment, or as sole ignition in place of the high-tension magneto. We regard it as being fully up to the high standard of merit for which Atwater Kent equipment is known.

Interesting Booklet D and detailed information sent upon request.

Making the Perfect Plug- "Reliance," of course

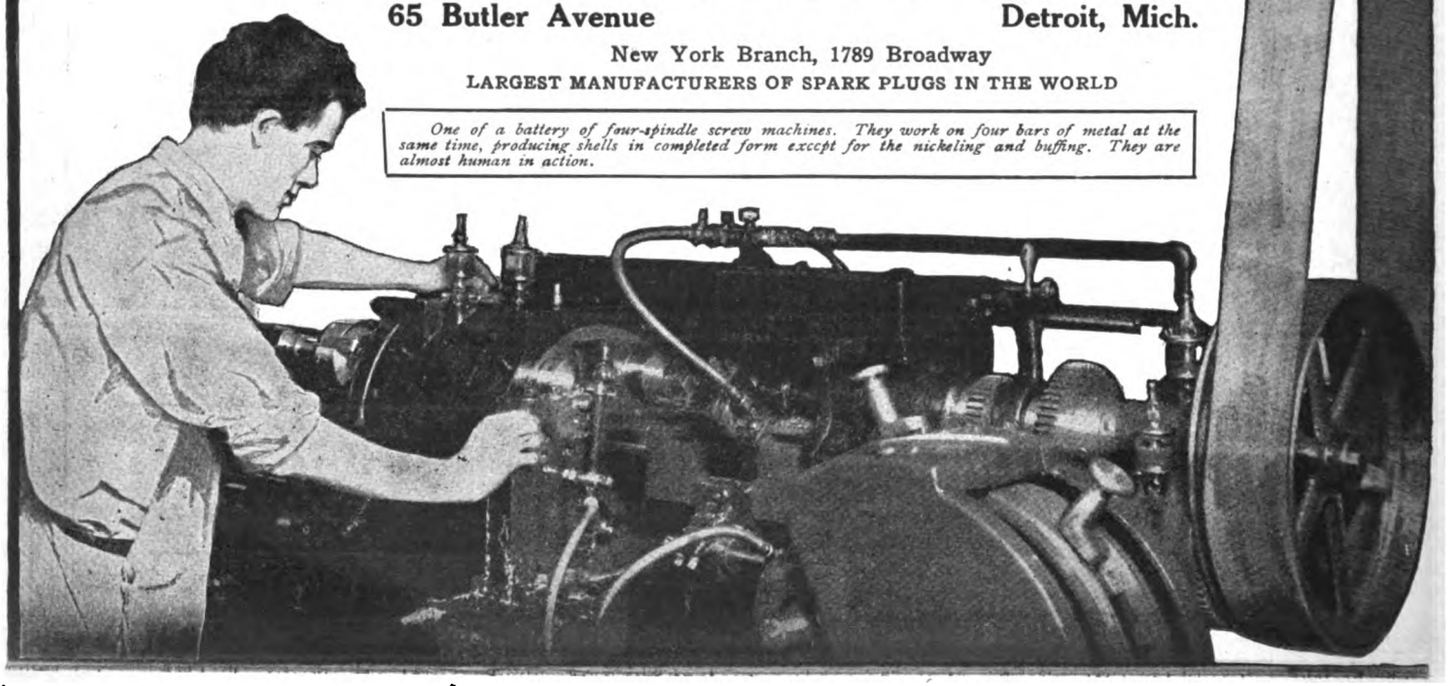
The perfect plug is one that will not become fouled, will not short-circuit and will not give way even in the intensest heat. If you get all these properties in a plug, you would save money even if you paid double cost.

In the Reliance Magneto Plug these properties are obtained to a greater degree than in any other plug on the market. Built with strict observance to electrical laws, and with a heat defying porcelain produced in our own plant, the results are surprising as well as gratifying, and the cost is only $1.25 each.

Only the superior methods of Jeffery-Dewitt construction make this great plug possible. Every plug is fashioned by experts. Expert potters in our own potteries make the porcelain from imported clays; expert machinists are in charge of our automatics which turn out our metal parts, perfect in every detail. The bushings are case-hardened to withstand any usage, and our supervisors oversee every step of the operation.

More than that—the Reliance Magneto Plug has a central electrode of platinum-iridium, so proportioned that it is practically impossible to short-circuit it with soot.

Ordinary plugs use only a mere tip of platinum, the precious metal which costs two and a half times as much as pure gold. But the central electrode of the Reliance Magneto is of **solid** platinum-iridium baked into the porcelain by a secret process that does away with nuts, gaskets and the like, and absolutely prevents compression leakage. This plug also has a closed end that gives greater stability and makes this the one plug that is **supreme in oily engines.**



Yet the price remains only $1.25, and if your dealer cannot supply you we will mail prepaid as many as you want on receipt of price. **When writing specify size wanted or make of car.** Remember our ironclad guarantee: *"Your money back or a new plug unless you are absolutely satisfied."*

JEFFERY-DEWITT CO.

Warner AUTO-METER

THE big American automobile manufacturers in 1913 for the first time acknowledge the necessity of equipping their cars with an accurate speed and mileage indicator. After the most exacting series of tests they have virtually made a unanimous selection.

The WARNER AUTO-METER is recognized as the world's OFFICIAL and standard speed and mileage indicator. Manufacturers planning full equipment sought the best indicator They invited tests. It was the survival of the fittest.

The Warner Auto-Meter won. It won although the highest in price.

Practically all the prominent cars for 1913 are equipped with Warner Auto-Meters. The majority of the highest grade cars are Warner equipped. Over 100,000 new cars will be Warner equipped this year.

Examine the speed indicator on your prospective car. It is an indication as to the quality of the whole car.

Priced from $50 to $145. For sale at our branches and by leading dealers all over the world. Handsome catalogue on request.

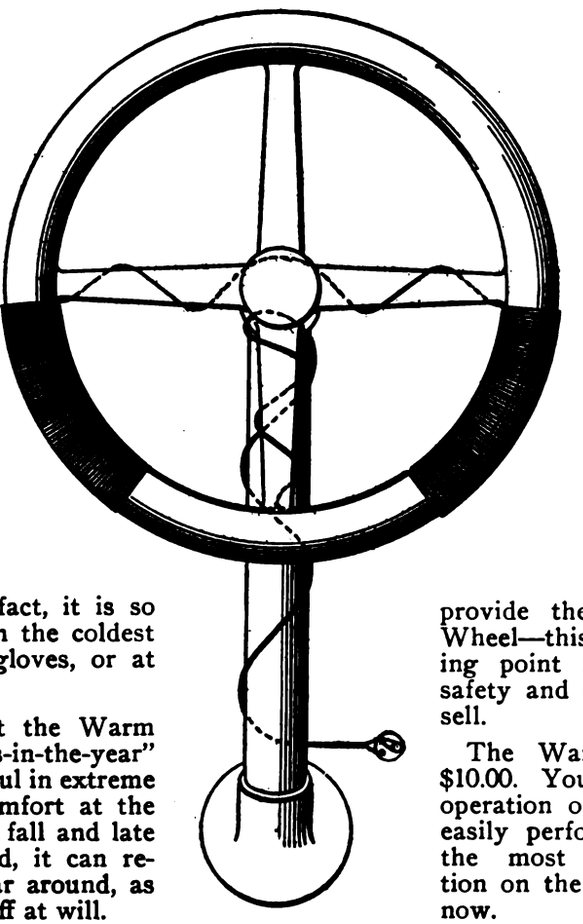
A Child Could Sell This Electric Warm Hand Wheel



When an Accessory so Desirable is Shown to the Motorists in Your Territory the Value of Expert Salesmanship Drops Down Several Degrees Below Zero

This Warm Hand Wheel, Mr. Dealer, is not a luxury—it is a necessity, and the difference between a luxury and a necessity is simply that one is something that you can get along without and the other something you cannot get along without.

The Warm Hand Wheel is so much a necessity that a child can sell it, and in your territory there are certainly enough of drivers who will appreciate it to make your selling connection with us extremely profitable to you.

The Warm Hand Wheel protects the driver's hands against the coldest kind of weather, giving him comfort and ease in driving through blizzard, snow and sleet—in fact, it is so efficient that it can be used in the coldest weather without the use of gloves, or at most, with very light gloves.

We need not tell you that the Warm Hand Wheel is a "six-months-in-the-year" necessity, for while doubly useful in extreme cold weather it is a solid comfort at the disposal of the driver in early fall and late spring—in fact, when installed, it can remain upon the car all the year around, as the heat may be turned on or off at will.

The factor of safety incident to the use of this device is too great to overlook. Many of the steering accidents occurring during the winter months are due to the sudden cramping and stiffening of the hands—with the Warm Hand Wheel this danger is entirely removed.

We assure you that if you will install just one of these wheels on your own car, you will attract the buying interest of every man in your vicinity who drives. This fact cannot be discounted.

It needs only to be demonstrated to be appreciated.

Ask the manufacturer whose cars you handle to provide them with the Warm Hand Wheel—this will be an added car selling point for you and it will mean safety and comfort to those whom you sell.

The Warm Hand Wheel sells for $10.00. Your commission is liberal. The operation of installation is rapidly and easily performed. In fact, it is today the most attractive dealer proposition on the market. Get your territory now.

Knox

MARTIN TRACTOR

Maximum Carrying Capacity
Minimum First Cost
Minimum Maintenance
Minimum Turning Radius

What It Is

Not a Theory But a Proven Success in a Year's Gruelling Work. Many in Successful Operation. 5 to 10 Ton Capacity. Full Details Explained in Tractor Catalog. Send Today.

A motor unit that may be attached to any heavy vehicle designed to be drawn by horses; the combination making a five-wheeled motor-drawn vehicle.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE COST OF RUBBER TIRES. Wagons have been doing good work for many years on steel tires and there is no reason why they will not continue to do so when drawn by the tractor; the heaviest part of the load is always carried on steel tires.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE VIBRATION ON STIFF SPRINGS. All working parts of the tractor are carried on springs as resilient as those of a pleasure car.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO SUDDEN STARTING OR STOPPING OF HEAVY LOADS. The cushioning of the shock between the engine and the load is one of the most important advantages gained, (fully explained in catalog).

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO NEGLECT ON ACCOUNT OF INACCESSIBILITY OF PARTS—all parts of the tractor being more accessible than on a touring car.

IT SAVES HEAVY MAINTENANCE CHARGES due to frame twist. The tractor accommodates itself to all road unevenness.

The single front wheel can be turned at 80 degrees angle, enabling the driver to back to any position or turn completely around in the narrowest street.

A Knox Martin Tractor costs less than a two-ton truck; has a capacity of 5 to 10 tons.

TIMKEN
TAPERED ROLLER BEARINGS

Keeping Down Cost of Commercial Car Maintenance

TIMKEN TAPERED ROLLER BEARINGS save maintenance cost. That is due to the following significant facts:

They carry the heaviest loads. They meet the greatest "end-thrusts." They offer the longest resistance to wear.

And when minute wear comes—as it must in any moving parts—it is entirely taken up by adjustment with no sacrifice of the original characteristics of the bearing.

Perfect Adjustment All-Important in Keeping Down Expense

It's at the very foundation of Commercial Car efficiency.

The car must pay interest on the investment.

Replacements cost money.

Non-adjustable bearings when they wear, must be junked—nothing can save them.

You can't even use them at all without additional bearings to meet the tremendous end-thrusts of commercial car service.

Timken Bearings save you that expense.

Timken Superiority Due to Principles of Design

It can easily be demonstrated in theory.

It is demonstrated every day in practice—by actual service under all conditions.

A roller carries greater weight than a ball because its supporting surface is a line instead of a point.

The tapered rollers of Timken Bearings enable them to meet end thrusts as easily as vertical loads.

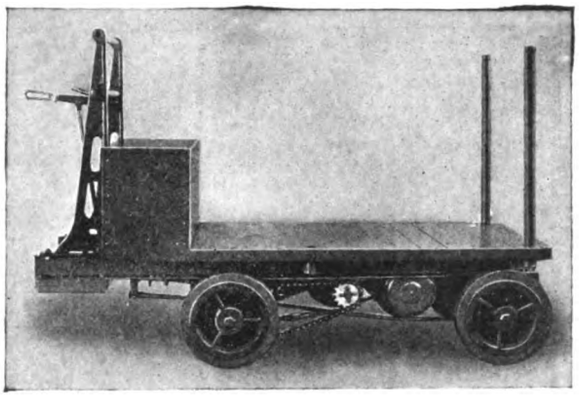
They can be adjusted because of their conical shape.

By simply bringing cup and cone more closely together.

This adjustment is perfect because it sacrifices none of the original principles of the bearing.

It's Worth While to Understand the Importance of Bearings

This is clearly brought out in the Timken Primer No. T-1 "On the Care and Character of Bearings." It tells how bearings are made, how they are used—all about them. Write for a free copy.



The Timken Roller Bearing Company

Canton, Ohio, U. S. A.

The only axle manufacturer licensed to make automobile axles equipped with Timken Roller Bearings is the Timken-Detroit Axle Company

Read What Satisfaction Diamond Chains Are Giving on This Truck

Several years ago, the Automatic Transportation Co. of Buffalo began using Diamond Chains on their standard storage-battery-driven freight-handling trucks. Recently this firm commented as follows upon the performance of the Diamond Chains which they had purchased:

"We are very glad to state that these chains are giving perfect satisfaction under the severe strain to which they are subjected in handling freight at many railway and steamship terminals. Frequently the trucks are required to haul their capacity of from two to four thousand pounds up grades ranging from twenty to thirty-five per cent. We had no trouble with the chains."

What Diamond Chains do here they will do elsewhere. Nickel steel rivets and special steel side bars, and precision in machining and heat treatment assure a capacity and durability on which you can place absolute dependence.

We make the types and sizes to cover every vehicle requirement and are always ready to offer helpful suggestions to designers of transmissions. Ask for book on "Chain Transmission of Power."

Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

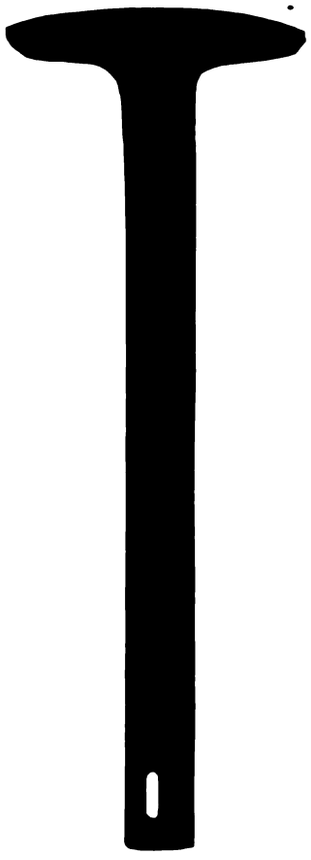
THINK THIS OVER

very carefully and read it twice, if necessary.

Is there any part of an automobile engine, or any other gas engine, that is more important to its efficiency than a Valve?

Your engine leaves the factory running smoothly and sweetly - tuned up to its highest power. Perhaps the valves pit—warp go out of shape fail to hold compression. Then the power diminishes, and what can be more aggravating to the driver, who has known the fullness of the pulling power of his motor, than to have it grow less and less?



You cannot slight this part by putting in an inferior product—valves that will give trouble, or even break from inexperience in their manufacture—valves of unsuitable material, not suitably heat treated.

Too much is at stake, and a slight extra cost at the outset, which is the exception, may save you many times over a probable later expense.

This Company, with the experience of many years as a guarantee, will furnish you with properly made valves, of the materials best adapted to your requirements.

Not only QUALITY, but efficient SERVICE is a factor—surely there is a satisfaction in getting the kind of work you want—when you want it.

"WHITNEY" Chains
Are Used by the Leaders

Every "Whitney" Chain has a reputation back of it, a reputation of having been tested in the most trying service and never failing to make good.

The "Whitney" Cotter Detachable Chain has made for itself a record, which no other detachable type has approached. The shortening, lengthening or repairing is a simple matter, as the chain can be easily separated at each link and parts removed or inserted without the use of any special tool. It is therefore the Most Practical Chain for Motor Vehicles.

When making replacements insist on a "Whitney" Detachable.

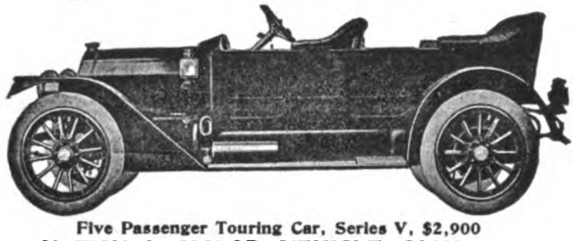
To Manufacturers of Motor Cars:

Have you considered the important advantages of using the American made New Departure ball bearings in your new models?

It is a significant fact that most manufacturers of motor cars have done so and after testing them out, have contracted with us for their requirements.

Take a short cut to a quick discussion of your bearing problems by sending us your blue prints and data. You will receive by return mail our catalogue-treatise, written by our staff of engineers. This will be followed quickly by a letter from our chief engineer frankly stating the result of his study of your bearing requirements, with a view to securing maximum efficiency at minimum installation and maintenance cost.



Write today. It will save your time and expensive experimenting.

Schafer Ball Bearings

The "Schafer" ball bearings are the standard of the world. They have been for years at the pinnacle of merit, and remain there because of exceptional workmanship, and the care taken in every step of the manufacture.

The ball bearings are made of especially analyzed, extraordinarily dense crucible cast steel, that combines uniform hardness with toughness from center to surface. All balls show a wonderfully great crushing strength and any ball showing the slightest defect is promptly rejected.

In specifying Schafer Ball Bearings, the manufacturer of the car is assuring the ultimate buyer of one point of quality that goes to make a good automobile still better.

from base to spark plug, have features that are "Different and Better."

JENCICK MOTOR CORPORATION
Port Chester, New York

Repairing Casing

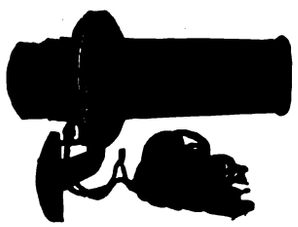
TIRE CUTS ruin casings. They admit moisture to the carcass, cause the fabric to rot and weaken, grow larger-end in blowouts.

You can repair **CASINGS** and **INNER TUBES** anywhere in 15 minutes, better than a Repair Shop can do—and for *one cent.*

Universal Auto-Vulcanizer
Patented

A practical vulcanizing outfit complete, with enough repair gum to make 40 patches. It weighs 3 pounds and can be carried in the tool box. **Simplest and most satisfactory device for eliminating tire troubles that has ever been devised.**

Absolutely automatic. Place the patch—attach the Vulcanizer—put in the gasoline light it. No further attention required. In 15 minutes the job is done.



It *can't burn, scorch* or *injure* tube or casing. It *can't* get out of order. It *can't* fail to do its work. So simple, anyone can operate it. The Universal Auto-Vulcanizer saves its cost a *hundred times* over in trouble and expense.

Price Complete, **$4.00** Ready for Instant Use
Guaranteed Satisfactory or Money Refunded

INTERLOCK INNER TIRES

Stop Tire Troubles

The one weak point of the automobile is that you cannot depend on the tires. Thousands of motorists have solved their tire problem by discarding inner shoes, reliners, fillers and other makeshifts and equipping their tires with **Interlock Inner Tires.**

Interlocks are complete inner tires (not inner shoes) placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They double the mileage of new tires and add 1,000 to 5,000 miles to old ones—save half your tire expense—and make tires trouble proof.

Dealers and Motorists—Investigate Interlocks

Don't delay—write now for booklets, data, prices, testimonials of users, road tests, etc. Mention size and kind of tires you use.

DOUBLE FABRIC TIRE CO. 600 W. 9th Street, Auburn, Indiana

FRANKLIN MOTOR CARS

AVERAGE

400 MILES TO THE GALLON OF OIL

This is proof of the superiority of the Franklin re-circulating oiling system:—

And of the high efficiency of Franklin direct cooling.

It is double the average mileage per gallon of oil obtained by owners of water-cooled cars.

Franklin re-circulating oiling system delivers a steady stream of oil to each of the main motor bearings through separate leads. It is the only oiling system that feeds oil positively and directly to each of the main bearings.

The amount of oil pumped over the bearings is proportional to the needs of the motor. The faster the motor runs the more oil supplied. This means perfect lubrication under every condition of running.

Weed Chains
The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires
Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

DEALERS: You'll see that this department is growing!

This is the first week we've been able to run over into the third page.

The bigger it gets the better for YOU and for US. For you—because it gives a greater volume of opportunities for trade. For us—because—well, the answer's too easy to this!

Look these three pages over carefully. You won't be on to your job as a dealer if you don't at least do that much.

FOR SALE—1906 Pierce-Arrow seven passenger touring car, completely overhauled this spring, in first-class running condition, could be used as taxicab or turned into first-class delivery truck for beer peddlers and similar purposes. Cheap to prompt cash buyer. J. R. J., 1004 Sunset Ave., Utica, N. Y.

MANUFACTURERS!

As attorney for the heirs of an immense estate, I desire to connect one of the heirs with a reliable automobile manufacturer in an executive capacity, where he can enter the firm, by investing a substantial sum in about six months, at which time he will receive his share to the estate.

Thoroughly familiar with the selling end of commercial vehicles, thoroughly understands conditions relative to the sale of commercial cars in New York City and vicinity, and has plenty of prospects. Has thorough business training, clever correspondent, and capable of meeting and conversing with men of affairs.

Would prefer to manage New York branch of reliable truck firm, but would consider proposition from pleasure car firm, or manufacturers of any reliable lines connected with the automobile trade.

Selling agencies, please do not waste your time or ours answering, as we desire to hear from manufacturers direct.

State fully what you have to offer, also salary and opportunity for investment of the funds, which will be available in about six months.

Address "EXECUTOR,"

444 59th St.,

Brooklyn, N. Y.

STURDINESS

PREDOMINATING—even above the handsome appearance, and general distinctiveness of the Conover Safe-Guard—is its *sturdy* strength.

It is a formidable defender of the vital front parts of your car; an effective barrier between the lamps, fenders, radiator, wheels, frame and — *damage.*

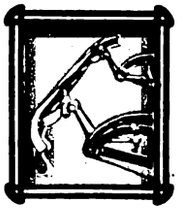
THE Conover Safe-Guard is a massive channel-bar—not an ordinary pipe "bumper." It is supported at four points—rather than two—by *semi-elliptic* steel springs—of the same character and strength as the chassis springs of the most expensive car.

If dented it may easily be hammered back into its original shape. This is an important feature.

THE Conover Safe-Guard is guaranteed against any possible contingency that may arise—from any cause—for a period of two years.

In other words, the manufacturers offer it as something intended to be broken, if that is necessary, in order to protect the value and usefulness of the car behind it. And they continue this protection at their expense for two years. Such confidence have they in its durability and protective power.

PRICES:



Best quality of steel heavily enameled in black, royal blue, French gray or maroon; bar 2 in. wide. *(Any other color of enamel $5.00 extra)*	$15.00
Best quality of steel, brass or nickel plated; bar 2 in wide	17.50
Solid bronze, finished in either brass or nickel; bar 2 in. or 2¾ in. wide	25.00

Shipped express paid, anywhere in the United States, on thirty days' trial, upon receipt of regular price. When ordering give name and model of car. Specify size and finish desired. An attractive booklet will be sent upon request.

70% More Tire Miles

WIRE McCUE WHEELS

This illustration shows one of the latest Stutz models with Mr. Stutz at the wheel. The Stutz car of a similar model, equipped for racing, which made so remarkable a showing at Milwaukee—so remarkable as to be designated by the press as the most sensational in the running of the race—also carries wire wheels as regular equipment.

On the Race Course

Aside from winning practically every event of any note abroad for the past couple of years, wire wheels made a remarkable showing in the running of the Vanderbilt race, last week. Hughie Hughes, in a Mercer, very much smaller powered than the winner, was defeated in the 300 miles by 43 seconds. Gil Anderson, in a Stutz, was fourth. These two cars, both of which were wire wheel equipped, were the only American cars among the first five, the other three cars being foreign speed creations of large size.

In speaking of the showing of these two cars, The Automobile says: **"The race of the Mercer was wonderfully good, as Hughie Hughes was well up with the more powerful Mercedes pair throughout"—"The Stutz made an elegant showing, running the steadiest race of the field. The car lacked only the supreme power to take the pace."**

Both of these drivers will tell you that wire wheels not only saved time by making the tires last longer but by making the cars easier to handle and by making them hug the track more closely, they enabled faster driving, particularly on the curves.

On Private Motor Cars

As we have pointed out several times before, the winning of races with wire wheel equipped cars simply serves to emphasize the value of wire wheels on cars for general touring. Practically all of the leading cars abroad, both those used for racing as well as those used for individual owners, give preference to wire wheels for stock use. Just as soon as the remarkable advantages of wire wheels over wooden wheels were demonstrated to the foreign manufacturers, they almost entirely discarded their wooden wheel equipment in favor of wire wheels.

That condition is taking place in America just as surely as it did abroad—a little more slowly in this country because of peculiar business conditions existing in the automobile industry—but wire wheels are here and a great many car manufacturers will furnish them for 1913. Those dealers who are keen to be the first to offer a wonderful improvement to their customers will insist upon wire wheels on the cars they are selling. You can get wire wheels if you will insist. If you have any trouble about getting wire wheel equipped cars, write us and we will help you.

The McCue Company, Buffalo, N. Y.

Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

Price $1.00 Each
Ready for Delivery Now

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers and the dealers, or

Water All Around

You can remove this tube or one hundred like it and make your own repairs

FEDDERS

Radiators

ASIDE from their general all-round superiority and efficiency, the ease with which Fedders Square Tube Radiators may be repaired is a point well worth considering. Any tinsmith with a pair of soldering irons can repair one or one hundred tubes with ease and speed in the event of an accident of any sort; whereas with radiators of any other type, the question of repair generally is a question of laying up the car for some considerable period.

While we lay special stress upon the value of square tube radiators and urge their use, at the same time we have the plant and the equipment to produce whatever type, style and size radiator may be desired. Just send us your blue prints and we will give you figures to your specifications.

One point that all dealers should bear in mind is this—if the car you sell is equipped with a Fedders radiator, you have a strong quality argument in that fact. Don't overlook this.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, October 10, 1912 No. 3

AUTOMOBILE SALES ASSOCIATION FORMED AT INDIANA CONVENTION

Meeting of Manufacturers, Dealers, and Other Tradesmen, Called to Discuss Problems, Results in Nucleus of National Organization—Speakers Emphasize Importance of the Dealer.

Indianapolis, Ind., Oct. 9.—The first general sales convention of automobile tradesmen closed this afternoon, after forming a permanent organization, to be known as the General Automobile Sales Association. It was the outcome of a resolution introduced by Louis Wurzburg, of the Colt-Stratton Co., of New York, seconded by Maxton R. Davies of the Motor World. The idea was presented to the convention and met with united approval of those present. The following is the resolution:

Whereas, We, the charter members of the first automobile retail sales convention are of the opinion that an organized movement on behalf of the retail dealers will be of great benefit to the industry, be it

Resolved, That we hereby constitute ourselves the nucleus of such an organization and pledge ourselves to its perpetuation, and be it

Resolved, That the next meeting be held in Detroit in 1913, at a date to be later determined, and be it further

Resolved, That the following men be appointed as a committee in charge to serve the year: John C. Wetmore, New York Evening Mail; William Boyd, Curtis Publishing Co., Chicago; E. Le Roy Pelletier, Detroit; J. J. Cole, Indianapolis; Hugh Chalmers, Detroit; Roy D. Chapin, Detroit; Carl H. Page, New York; Captain H. L. Stratton, of New York; Charles W. Mears, Cleveland; H. M. Swetland, New York; John Lee Mahin, Chicago; Frank B. Stearns, Cleveland, and Homer McKee and G. J. Monihan, Indianapolis. Pelletier is chairman of the committee.

The convention, which was a daring conception and reflected great credit on J. J. Cole and other men who conceived the plan, was a success from every standpoint. The basis of the movement was well expressed by President H. O. Smith, of the Premier Motor Mfg. Co., who stated in the opening address yesterday that the problem of distribution is vastly more of a problem than the problem of manufacture, and that the dealers were invited with the idea that something might be presented that might arouse them to action. The poor car, he said, had some chance with a good dealer; he added that the average salesman's list of prospects was a list of car users, and urged that more effort be made to create new interest in selling to the much wider market consisting of those who do not own cars. The big problem, said Smith, is not how this country can absorb two or three hundred thousand automobiles but how to arouse its immense dormant buying power. He urged that dealers who take hold of a line give it sufficient support and back it to the limit, and that more attention be paid by dealers to quality.

Elbert Hubbard, of East Aurora, told the convention that his son is an automobile

REORGANIZATION OF U. S. MOTOR FINALLY ACQUIRES MOMENTUM

Creditors' Committee Secures Part-Cash Offer After Hope Seemed Vain—Stockholders To Be Assessed $24 Per Share—Basis On Which Old Stock Will Be Exchanged for New.

Reconstruction of the embarrassed United States Motor Co. now may be said to have made substantial progress. After nearly two months of unremitting work, the creditors' committee, of which Sidney S. Meyers is counsel, has evolved a plan which has been recommended to the creditors for acceptance and which is so much better than earlier expectations made appear possible, that there is small likelihood that it will fail of a general welcome.

It provides for not merely an allotment of stock but for payment of 25 per cent. in cash. As, at forced sale of the big corporation's property, the merchandise creditors hardly would have received a penny, the 25 per cent. in cash that has been tendered is viewed as an uncommonly favorable settlement.

In addition, the creditors will receive 65 per cent. in stock in the new company which will be organized—25 per cent. in first preferred, 25 per cent. in second preferred and 15 per cent. common, a total of 90 per cent. of their claims.

As it is known that at one time the creditors' committee was offered a settlement made up wholly of paper, and later was tendered only 10 per cent. in cash, the measure of the present settlement is made plain. It required earnest work on the part of the creditors' committee to bring it about and it was made possible only because the holders of the $6,000,000 United

Digitized by Google

States Motor debentures generously gave their assent and permitted the creditors to be favored.

The holders of these debentures to the amount of exactly $6,161,510, will receive no cash whatever; instead, they will accept 140 per cent. in stock of the new company —50 per cent. in first preferred, 50 per ecnt. in second preferred and 40 per cent. in common, the apparent premium of 40 per cent. being a return for their generous action, and which is not considered unfair inasmuch as the debenture holders must dispose of the new stock as best they may.

To pay the creditors their 25 per cent., and to provide working capital for the reorganized company when it is to be formed, $6,730,087.87 will be raised by levying an assessment of $24 per share on both U. S. M. common and preferred, the same assessment being levied on the shares of the Columbia Motor Car Co., which it appears are separartely held. This assessment of $24 will provide funds as follows:

On 11,499,733 U. S. M. pref....	$2,759,935.92
On 12,206,350 U. S. M. com....	2,929,524.00
On 13,400 Columbia preferred.	3,216.00
On 118,000 Columbia common	28,320.00
	$5,720,995.92
Cash on hand at the close of ness September 11, 1911....	1,009,091.95
Total	$6,730,087.87

Of this amount, $3,000,000 will be utilized as working capital and the balance will be used to discharge claims against the two classes of creditors, the first of which holds paper endorsed only by the United States Motor Co. and the second which holds paper bearing the endorsement of both the big company and its subsidiaries.

Both the merchandise creditors and the banking creditors will participate in the 25 per cent. cash settlement. An underwriting syndicate has been formed and is standing back of the proposed plans.

The reorganization plan will provide for the formation of a new company which will be capitalized at about $28,000,000, instead of $42,500,000 as in the case of the present company, for which a receiver was appointed on September 11th. Of the latter, it transpires that but $23,837,000 had been issued, which amount takes no account of the $6,000,000 debentures.

The holders of the present preferred stock in both the United States Motor and Columbia Motor Car companies and who will be assessed 24 per cent., will receive 24 per cent. of first preferred shares in the new company, 25 per cent. of the second preferred and 30 per cent. of the common. The holders of the common stock, who also must meet the assessment of $24, will receive 24 per cent. in first preferred, 17½ per cent. in second preferred and 30 per cent. in common.

STEARNS COMES TO RELIEF OF THE KNIGHT SITUATION

Cleveland Car Maker To Produce the Sleeve-Valve Engine for the Trade —Removes Embarrassment of Atlas Failure.

With the Atlas Engine Works, of Indianapolis, still in the hands of a receiver and its future problematical, the Knight situation in this country has been saved by the F. B. Stearns Co., of Cleveland, to whom the Knight interests owe so much.

As is fairly well known, but five Knight licenses were granted to American manufacturers, four of them to makers of cars and the fifth one to the Atlas Engine Works, which, it then was stated, gave to it the exclusive right to produce Knight engines for the trade at large. The Indianapolis company booked substantial orders from the several manufacturers, Stearns excepted, who produced cars employing the well known sleeve-valve motor, and also took contracts from a number of others who purposed employing it. When the Atlas Engine Works failed, some four months since, all of these manufacturers were greatly embarrassed by the closing of their source of supply. On two separate occasions, it appeared likely that a purchaser for the Atlas plant had been found but the negotiations fell through and, as a result, the situation has been discomforting, to use a mild term.

Apparently no relief was in sight until late last week, when it became known that the F. B. Stearns Co. quietly had been arranging to save the situation. It transpires that its license under the Knight patents does give to it the right to manufacture motors for the trade, and this is exactly what the Stearns company has arranged to do. Recent additions to its factory in Cleveland have enabled it to undertake the work, and as the Knight motors soon will be available the embarrassment now felt by several car manufacturers will be relieved; and as, since its adoption of the Knight engine, some two years ago, the Stearns company has built every part of its engine, none better is fitted to carry on the work.

The demand for the Stearns-Knight car itself continues unabated. During its first Knight year the Stearns company did the largest business in its history, and every indication points to a still larger volume. At the end of the first quarter of its new fiscal year—that is, at the end of September, 1912—its records show that it has shipped a greater number of cars than ever before, the increase over the corresponding period of the preceding year being more than 100 per cent. In addition the orders which are in hand also are of a record-breaking nature.

Grabowsky, of Illinois, in Trouble.

Wholly separate and distinct from the proceedings brought by a stockholder against the manufacturing company of the same name in Pontiac, Mich., which still are pending in the courts of that state, the Grabowsky Power Wagon Co. of Illinois, the headquarters of which are in Chicago, has been placed in the hands of the Central Trust Co. as receiver. The same trust company also has been appointed ancillary receiver for the New York property of the Illinois company, which consists of a six-story garage at 245 West 12th street, New York City, where between 30 and 45 trucks are in use and some 54 men employed. Under contract, most of the trucks are in the service of New York department stores. The proceedings which resulted in the appointment of the receiver were instituted by Maurice Moyer, a creditor for $3,000, who alleged that while insolvent the Illinois company made a preferential payment to a Chicago bank; also that creditors had become restive and were threatening suit. The estimated value of the property in New York is $50,000.

Work Started on Marathon Tire Factory.

The Marathon Tire & Rubber Co., recently organized, has acquired a site in Cuyahoga Falls, O., on which is being erected a building, 65 x 300 feet, which it is expected will be completed, equipped and ready to begin the production of tires about November 1st next. The officers of the company are: John R. Scott of Cleveland, president; W. F. Ridge and Walter H. Jenks of Akron, respectively vice-president and general manager and secretary-treasurer. These officers with C. W. Vaughn of Cuyahoga Falls constitute the board of directors. Both General Manager Ridge and Secretary-treasurer Jenks previously were connected for a considerable term of years with the Firestone Tire & Rubber Co., of Akron, which implies that they possess the necessary experience. The sales manager of the new company will be Franklin Kesser, who for many years was a member of the sales department of the Hartford Rubber Works Co. but who more recently has been a member of the staff of the Firestone company.

Havers Declares Big Dividend.

To mark the close of its fiscal year, the Havers Motor Car Co., of Port Huron, Mich., maker of the Havers "six," has declared a stock dividend of 40 per cent. and a cash dividend of 5 per cent. The company is capitalized at $200,000.

JONES SEEKS LAW REMEDY WHEN ARBITRATION FAILS

Claims Precision Tool Company Refused to Abide by Decision of Arbitrators—Latter Denounced by Precision.

Arbitration of business disputes as a means of avoiding litigation is not rare and has been much written of, but that it does not always result as well as fancy pictures is indicated by a suit now awaiting trial in the Supreme Court for New York county, wherein the Jones Taximeter Co., of New York, has taken issue with the Precision Tool and Instrument Co., also of New York, and in a lengthy legal complaint asks the sum of $7,503.33. The reasons therefor are voluminous and the answer of the Precision company is not less brief, and in both the failure of arbitration is made clear.

The difference of opinion which led to unsuccessful arbitration arose over a contract whereby the Precision company on May 1, 1909, contracted to complete a total of 3,000 taximeters for the Jones company, the Jones company to pay bills weekly and to meet all legitimate expenses of manufacture with an added 25 per cent, profit to the Precision company. Defects were to be remedied free of charge. Should the price per meter exceed $40 but not exceed $45, the Jones company was to be permitted to receive such a sum as would reduce the profits to 20 per cent. In the contract there also was a provision that all disputes be arbitrated by a board consisting of a man chosen by each of the disputants and a third man chosen by the two so named.

The whole bill, so the complainant says, amounted to $134,307.50, a price of $44.77 per meter, and the Jones company thereupon demanded $5,372.30 as its 5 per cent. reduction in the profits, which demand was refused. Other claims are that the defendant charged $5,831.30 for repairs which should have been made free of charge; charged more than its 25 per cent. profit on certain items; sold certain parts belonging to the Jones company; delivered defective goods which did the Jones company great damage; delayed output and delivery; refused the Jones company access to the Precision books and records and did a long list of things which totaled a disputed account of $74,274.

Then the arbitrators got busy. The Jones-Precision Hague Tribunal hardly had commenced deliberating before the Precision delegate resigned, so the Precision answer states. It adds that the third member, being supposed to have information only as the other arbitrators introduced it as evidence, went ahead and investigated for himself, talking with Precision employes and committing other such acts. However, the arbitrators, even if one of the board had resigned, were undaunted and went through with flying colors, returning with promptness a verdict of $7,503.33 for the Jones company, which the Precision company as promptly refused to pay. The arbitration having gone for naught, the inevitable law was resorted to, and last week the Jones attorney notified the Precision lawyer that unless certain papers and letters in the defendant's possession are produced at the trial, the evidence on these points would be received second-hand. Meantime Jones is making taximeters and is awaiting developments.

Flanders Files a $300,000 Mortgage.

To take up $80,000 of the indebtedness of its predecessor, the Metzger Motor Car Co., and for the purpose of acquiring additional working capital, the Flanders Motor Co., of Detroit, which is a Delaware corporation, has filed a trust indenture and first mortgage running to the Union Trust Co., of Detroit, for $300,000. Three-year notes, maturing October 1, 1915, will be issued for the amount of the mortgage

New York Creditors Pursue Frey.

The Frey Auto Supply Co. of Buffalo, N. Y., is the defendant in two actions now listed on the current calendar of the Supreme Court for New York county. In one the Premier Novelty Mfg. Co. of New York City asks judgment on an account of $233.45 and in the other, of which an alleged unpaid bill is the basis, Gottfried Piel, also of New York City, trading under the style The G. Piel Co., asks $97.70.

Editor Becomes an Engine Manufacturer.

Victor C. Parker, editor of Modern Power, of Winnipeg, Can., has relinquished those duties and removed to Detroit, Mich., where he has formed the Parker Motor Co., which will manufacture a rotary valve engine of which he is the inventor. A temporary office and experimental shop has been established at 660 Grand River avenue, where the first engine probably will be produced within the next few months.

Stenographer to Make Inner Tubes.

Walter Reason, who is a court stenographer in Pontiac, Mich., has organized the Reason Tire Co. in that city, which will market a puncture proof inner tube of which he is the inventor. The tube itself is being manufactured in Akron and the initial output probably will be ready for the market before the close of the current month.

REORGANIZATION FAILS TO HELP MORGAN TRUCK

Creditors Secure Appointment of Receiver After Assignment Had Been Made—End of Long, Much-Checkered Career.

After an uphill fight which has extended over a period of about ten years, and despite the reorganization which was effected in July last, the Morgan Motor Truck Co., of Worcester, Mass., was petitioned into involuntary bankruptcy on Thursday last, 3rd inst. The petitioning creditors are Bofinger Bros., Lybrand, Ross Bros. & Montgomery and the Rowland Advertising Agency, all of New York, whose claims amount to $1,906. Their petition was filed with Judge Morton in the United States District Court in Boston, who appointed George A. Gaskel receiver. The liabilities of the company are placed at $78,000; at forced sale it is said its assets may bring $15,000.

Previous to the filing of the bankruptcy petition, the company had made an assignment to C. H. Derby, secretary of the company, who stated that the bankruptcy proceedings took him by surprise. Although the recent reorganization of the company suggested that a way out of its difficulties had been found, the appointment of a receiver will cause small surprise to the trade.

Its troubles, as stated, have extended over a long term of years. It was one of the pioneers in the commercial vehicle industry and was one of the first to build heavy trucks, but lack of capital always crippled its operations and prevented its substantial expansion. It several times has been reorganized, or partially reorganized, and on August 1st last, when the most recent change in its affairs occurred, its capital was reduced from $1,100,000 to $300,000, and Charles E. Foster, president of the Foster & Richardson Bedstead Co., of Worcester, Mass., assumed the presidency. Several other new men entered the company at the same time and Ralph Morgan, who organized the company and who was its engineer, retired. The accession of new blood served no purpose, however, and the company made an assignment prior to the filing of the bankruptcy petition in an effort to prevent that very action. Its future now is wholly a matter for speculation.

To Manufacture Trucks in Oklahoma.

The Oklahoma Motor Truck Co., of which P. E. Haworth is president, is reported to have commenced operations in Tulsa, Okla.; its plant is located at 103-109 North Boulder street.

AVERY COMPANY OFFERING $1,000,000 STOCK ISSUE

New Securities, Preferred As To Dividend, To Be Used for Retiring Bills Payable—Earnings Make Good Showing.

To retire its bills payable, the Avery Co., of Peoria, Ill., is offering the public $1,000,000 of 7 per cent. cumulative preferred stock, the subscription price being $100 per share and accrued dividend. The new issue is preferred as to dividend, and in the event of its dissolution, as to assets over the common stock. It is redeemable up to $115 per share, an annual sinking fund of 2 per cent. being created to retire the stock.

The Avery capitalization, in addition to the issue of $1,000,000 preferred, is made up of $2,245,090 common stock and, according to a financial summary which accompanies the offer to the public, the total net assets of the Avery Co., above all debts, amount to $3,420,269.49; liquid net assets, above all debts, $1,816,956.31; average annual net earnings for four years, $171,820.27; net earnings, January 1, 1912 to June 10, 1912, $256,860.47.

The earnings for the first six months of the current year have been at the rate of approximately seven times preferred stock dividend requirements. No prior liens exist on the company's manufacturing property and none may be created without the consent of three-quarters of the preferred stock.

Application will be made to list the new stock on the Chicago stock exchange.

The Avery Co. is best known to the automobile trade because of its motor trucks and tractors. It is the oldest and largest American manufacturer of agricultural implements. Its president is J. B. Bartholomew, who is the head also of the Bartholomew Co., which makes the Glide car.

Wishart Bookeeper Sues for Salary.

Claiming $725 as salary as bookeeper from March 16 to July 10 of this year, William Farnum brought suit against the Wishart-Dayton Auto Truck Co. of New York in the New York City Court, and Thursday of last week, 3rd inst., filed judgment. It was taken by default, and with interest and costs amounts to $752.84. Since the truck company is now in the banakruptcy court the collection of the judgment in full appears problematical.

Walpole Taken Over by New Company.

To take over the Walpole Rubber Co., a Maine corporation doing business at Walpole, Mass., there has been organized, under Massachusetts laws, the Walpole Tire & Rubber Co. It is capitalized at $4,500,000, of which $3,000,000 is 7 per cent. cumulative preferred stock and $1,500,000 common. It will continue the manufacture of tires and all kinds of rubber goods at the factory at Walpole. The preferred stock has no voting power and is retirable at option of directors at $120 per share and accrued dividends after five years from date of issue in lots of $50,000 at a time.

The incorporators are E. W. Tinkham of Harrisville, R. I.; A. T. Baldwin of Boston; F. J. Gleason of Walpole; E. C. Green of Boston; E. W. Forbush of Roxbury; L. O. Dulcos of West Roxbury, and J. C. Blanchard, Jr., of Boston.

Cleveland House to Market Mansfield Tires.

The Co-operative Tire & Supply, which as its name suggests will endeavor to give the car owner reduced prices, has opened up in Cleveland, O., at Euclid avenue and East 20th street; it will act as United States distributer of the tires made by the Mansfield Tire & Rubber Co. W. G. Henne, formerly of Mansfield, O., is president and general manager; the secretary and treasurer is Ralph E. Warwick, who formerly lived in Cleveland but who for some time has been in Washington, D. C., with the Multigraph Co. Both will hereafter make their residences in Cleveland. The intention of the organizers of the company is to establish branches in various parts of the United States.

Drake Again to Girdle the Globe.

Joseph R. Drake, treasurer of the Hupp Motor Car Co., of Detroit, who last year headed the Hupmobile globe-girdling "export expedition," departed on Wednesday, October 2nd, to retrace his wheel tracks and to enlarge the openings which he made during his previous journey. Last year Drake and his two companions worked westward, but on the present occasion Drake, who is going it alone, is headed east and first will visit Great Britain, whence he will go to Europe, India, China, Japan, the Philippines and Australia.

No Reo Dividend, But Fine Report.

Expectations that the Reo Motor Car Co. would declare a substantial dividend at its annual meeting in Lansing, Mich., last week proved vain. The reports that were rendered, however, showed the company to be in good shape, there being a surplus on hand of $1,500,000. The plant inventory totalled $3,648,000. The sales of the company during the past year amounted to $7,545,860. For labor there had been paid out during the year $1,092,000. There are in hand orders for 13,500 cars.

MIDGLEY TIRE TREAD NOW IN COURT OF APPEALS

Once Held Not To Infringe Adams Patent, Appeal Is Ready for Argument—Language of Lower Court Recalled.

Whether the Midgley tire tread employed by the Hartford Rubber Works Co., of Hartford, Conn., constitutes a patentable device, and whether it infringes the Adams patent, No. 609,320, probably will be decided for all time in the course of the present week. The case has been placed on the current calendar of the United States Circuit Court of Appeals for the Second Circuit, which is located in New York City, and is about to be heard.

The charge of infringement against the Hartford Rubber Works Co. was brought by the Metallic Rubber Tire Co., of Jersey City, N. J., which controls the Adams patent, which was issued August 16, 1898, to Dr. Calvin T. Adams, of New York. It covers a "vehicle tire and more specifically a bicycle tire," in the tread of which is embedded a woven or stitched metallic wire. The wires are corrugated and run parallel around the tread in the direction of its periphery, alternote loops projecting outward, tending to prevent skidding.

When the case was tried before Judge Platt, sitting in the Federal court in Hartford, in July of last year, he practically threw it out of court, after but one week's consideration. The Adams interest promptly filed the appeal which now is about to be heard.

When he denied that the patent had been infringed, Judge Platt stated that "it would be absurd as well as highly inequitable" to bring to bear on heavy automobile tires an invention, such as Adams's, conceived only with light bicycles in mind.

In the papers now before the Court of Appeals, it is brought out that not only the Hartford Rubber Works Co. but the B. F. Goodrich Co. acquired licenses to operate under the Adams patent, but the Metallic Rubber Tire Co. alleges that Thomas Midgley, who devised the tread which bears his name, was employed by the Hartford company to evolve a tire which would have the advantages of the Adams invention without making necessary the payment of royalty. The Midgley tread, according to the complainant, differs from the Adams device chiefly in that the embedded wires are coiled instead of corrugated. Under the Adams patent, it appears that the Hartford company contracted to pay a 5 per cent. royalty, while under the Midgley patent the royalty was half that amount.

The Week's Incorporations

Newark, N. J.—American Piston Ring capital; to manufacture motor parts. Corporators—Albert Wenzel, William Schmidt, Bertha Wenzel.

Paducah, Ky.—Henry Bros. Taxicab Co., under Kentucky laws, with $200 capital; to operate taxicabs. Corporators—E. E. Henry, Finis Henry, Toy Henry.

Logansport, Ind.—The Rutenber Electric Co., under Indiana laws, with $50,000 capital. Corporators—E. A. Rutenber, J. F. Digan, J. E. De Long.

Chicago, Ill.—Guaranty Auto Co., under Illinois laws, with $50,000 capital; to deal in motor cars. Corporators—J. T. Shea, Emily Crispi, C. D. Rattenhofen.

Seattle, Wash.—Apperson Motor Car Co., under Washington laws, with $5,000 capital; to deal in motor cars. Corporators—H. M. Brinker, L. H. Seely and others.

Nyack, N. Y.—Nyack Garage, Inc., under New York laws, with $15,000 capital; to operate a garage. Corporators—Alan Leggett, John J. Laine, Paul J. Dubois.

Charleston, W. Va.—Taxicab Co., under West Virginia laws, with $5,000 capital; to operate taxicabs. Corporators—F. J. Hill, F. A. McGrew, R. C. Lanham, J. H. Love.

Bucksport, Me.—Bucksport Motor Co., under Maine laws, with $6,000 capital; to deal in motor cars. Corporators—J. E. Witham, H. N. Churchill, H. E. Churchill.

Ellensburg, Wash.—Kittitas Automobile Co., under Washington laws, with $1,000 capital; to deal in motor cars. Corporators—P. W. Stenger, J. A. Larson and others.

Chicago, Ill.—Triangle Tire Co., under Illinois laws, with $5,000 capital; to deal in motor car tires. Corporators—Lawrence A. Cohen, Charles Aaron, Floyd M. Stahl.

Rockford, Ill.—Rockford Motor Truck Co., under Illinois laws, with $10,000 capital; to deal in motor vehicles. Corporators—P. A. Peterson, Levin Faust, John Ledin.

Chicago, Ill.—Commercial Motors Co., under Illinois laws, with $3,000 capital; to deal in motor vehicles. Corporators—Farren H. Ball, Agnes V. Lee, Godlip A. Bureh.

Newark, N. J.—W. C. D. Motor Car Co., under New Jersey laws, with $50,000 capital; to deal in motor cars. Corporators—P. C. Walls, W. E. Champing, W. J. Drumpelmann.

Houston, Tex.—Cole Motor Car Co., under Texas laws, with $12,500 capital; to deal in motor cars. Corporators—J. J. Settgast, Jr., A. J. Binz, F. H. Buelow, David F. Burks.

Newark, N. J.—American Auto Radiator Co., under New Jersey laws, with $10,000 capital; to manufacture radiators—George T. Richings, Roy N. Cunningham, Elizabeth Ritchings.

Spokane, Wash.—Co-operative Auto Sales & Supply Co., under Washington laws, with $1,100,000 capital; to deal in motor cars and supplies. Corporators—M. S. Alden and others.

St. Louis, Mo.—Reliable Auto Livery Co., under Missouri laws, with $2,000 capital; to operate a motor car livery. Corporators—Paul Bertrand, Anthony Hochdorfer, Karl Van Buskirk.

Rochester, N. Y.—Electric Car Sales and Service Co., Inc., under New York laws, with $10,000 capital; to deal in motor cars. Corporators—Max Bernstein, Minnie Bohrer, Glenn H. Leaty.

Atlantic City, N. J.—Holland-Donnelly Co., under New Jersey laws, with $100,000 capital; to deal in motor cars. Corporators—E. J. Holland, E. R. Donnell, G. C. Donnelly, H. L. Giberson.

Elizabeth, N. J.—Excelsior Automobile Co., under New Jersey laws, with $50,000 capital; to deal in motor cars. Corporators—Patrick H. McGann, Hippolyte St. Cade Raismes, Peter Kern.

Cleburne, Tex.—Cleburne Motor Car Mfg. Co., under Texas laws, with $10,000 capital; to manufacture motor cars. Corporators—H. E. Luck, G. A. McClung, O. L. Bishop and others.

Youngstown, Ohio—Youngstown Taxicab Co., under Ohio laws, with $10,000 capital; to operate taxicabs. Corporators—David Friedman, Bert Friedman, Helen Friedman and others.

Seattle, Wash.—Beattie Motor & Wagon Mfg. Co., under Washington laws, with $20,000 capital; to manufacture motor and horse-drawn vehicles. Corporators—W. J. Beattie, C. W. Burdick.

Columbus, Ohio—Silberzahn Gas Engine Co., under Ohio laws, with $10,000 capital; to manufacture internal combustion motors. Corporators—J. Silberzahn, Fred W. Kruse, Mark Winchester.

Santa Maria, Cal.—California Garage, under California laws, with $20,000 capital; to operate a garage. Corporators—Herbert W. Graft, C. I. Hough, R. E. Wheartley, M. Davis, A. H. Davis.

New York, N. Y.—Garden Garage Co., under New York laws, with $10,000 capital. Corporators—Oliver J. Griffin, Fannie C. Griffin, William Oakford, all of 123 West 51st street, New York City.

New York, N. Y.—Acton Taxicab Co., under New York laws, with $2,000 capital. Corporators—Oliver J. Griffin, William Oakford, Florence Oakford, all of 123 West 51st street, New York City.

Newark, N. J.—McDonough-Cogan Motor Co., under New Jersey laws, with $25,000 capital; to deal in motor cars. Corporators—Edward McDonough, Frank T. Cogan, George T. McDonough.

Cleveland, Ohio—Service Garage Co., under Ohio laws, with $10,000 capital; to operate a garage. Corporators—Roy J. Ramson, Karl W. Volk, Fred Desberg, Walter McMahon, John W. Willdis.

Canal Dover, Ohio—S. Toomey Co., under Ohio laws, with $60,000 capital; to manufacture vehicles. Corporators—R. I. Toomey, Theodore Williams, S. J. Brister, M. C. Toomey, Oliver Toomey.

Peoria, Ill.—Jefferson Automobile Co., under Illinois laws, with $30,000 capital; to deal in motor cars. Corporators—R. C. Uckena, Frank E. Howland, F. I. Archdale, W. G. Ronneberg, Cedric Howland.

Cleveland, Ohio—National Lubricating Co., under Ohio laws, with $5,000 capital; to manufacture lubricants. Corporators—Arthur A. Neiger, Maurice Rayden, J. Rathovitz, B. Hayden, Max S. Fishel.

Cleveland, Ohio—Cadillac Automobile Co., under Ohio laws, with $50,000 capital; to deal in motor cars. Corporators—Thomas B. Bolton, William H. Marlatt, F. H. Pelton, M. Jenkins, M. D. Hayes.

Minneapolis, Minn.—Twin City Motor Service Co., under Minnesota laws, with $50,000 capital; to operate a motor car service. Corporators—Frederick L. Gross, Abner G. Showers, William A. Alden.

Rochester, N. Y.—The Fordham Co., under New York laws, with $3,000 capital; to manufacture and deal in automobiles. Corporators—Gerald F. Cox, Eugene F. Reinke, Richard Stanton, all of Rochester, N. Y.

Digitized by Google

Indianapolis, Ind.—Marion Garage and Auto Co., under Indiana laws, with $15,000 capital; to operate a garage and deal in motor cars. Corporators—Burr Custer, Edgar S. Paynton, Gilbert P. Butterworth.

Cincinnati, Ohio—Ohio Chauffeur's Protective Association, under Ohio laws, to conduct a social and beneficial organization. Corporators—Grover Bennett, Charles Eckert, Roy Engleman, George Puls, Grover Jabe.

Rochester, N. Y.—Selden Truck Sales Co., under New York laws, with $150,000 capital; to deal in motor vehicles. Corporators—William C. Barry, George C. Gordon, Robert H. Salmons, all of Rochester, N. Y.

New York, N. Y.—48th Street Garage, Inc., under New York laws, with $1,000 capital; to operate a garage. Corporators—Harold C. Knapp, Richard H. McIntyre, Jr., Paul R. Towne, all of 258 Broadway, N. Y.

Cincinnati, Ohio.—Federal Motor Supply Co., under Ohio laws, with $250,000 capital; to manufacture motor car supplies. Corporators—A. M. Draddy, George W. Platt, Emil G. Schmitt, R. L. Dollings, M. F. Platt.

Newark, N. J.—McDonough-Cogan Motor Car Co., under New Jersey laws, with $25,000 capital; to do a general automobile business. Corporators—Edward McDonough, Frank T. Cogan, George T. McDonough.

New York, N. Y.—Imperial Auto Renting Co., under New York laws, with $1,000 capital; to rent motor cars. Corporators—Abraham S. Gusson, 621 East Third street, Brooklyn; David Abraham, 441 Hopkinson avenue, Brooklyn; Alexander Miller, 126 Fountain avenue, Brooklyn.

Changes in Capitalization.

Waukesha, Wis.—R. L. Kenyon Co. from $100,000 to $200.000.

Canton, Ohio—Knight Tire & Rubber Co. from $500,000 to $3,000.

Indianapolis, Ind.—Motor Car Mfg. Co. from $75,000 to $150,000.

West Allis, Wis.—Sternberg Mfg. Co. from $50,000 to $100.000.

Louisville, Ky.—Kentucky Automobile Co. from $24,000 to $65,000.

Cincinnati, Ohio—Standard Electric Tool Co. from $10,000 to $15,000.

Changes of Corporate Names.

Chicago, Ill.—Elmore Motor Co. to Illinois Automobile Co.

Chicago, Ill.—Henry Lee Power Co. to Old Reliable Motor Truck Co.

POPE'S ANNUAL STATEMENT SHOWS RENEWED STRENGTH

Sales Not So Large But Earnings Are Greater Than Previous Year—Dividend on Common—Figures in Full.

Its annual report for the fiscal year ending July 31st last, which just has been made public, shows that the Pope Mfg. Co., of Hartford, Conn., has recovered its tone. Its statement for the previous year was far from inspiring, but its present balance sheet shows that it has regained its strength and earning capacity to such an extent that not only is it likely that the 6 per cent. dividend on its preferred shares will be maintained but that a dividend at the rate of 4 per cent. will be declared on the common stock.

During the fiscal year of 1911, the company's sales amounted to $4,081,486.82, on which the net earnings were $214,119.22, a decrease of $531,272.11. During the year 1912 the sales were less, $3,734,112.56, but the net earnings amounted to $251,290.02, and the surplus has been increased from $860,203 to $1,012,920.

Working capital as shown by the balance sheet was $2,018,335 as compared with $1,409,597 last year. Cash on hand was increased to $253,829 from $92,069 in 1911, while materials and supplies on hand were increased from $1,190,841 to $1,477,313. Accounts and notes receivable were also increased from $338,329 to $396, 608, an increase of $58,279. Accounts payable were $179,528, an increase of $37,842.

The balance sheet in full is as follows:

ASSETS

Real Estate, Buildings, Plant, Equipment, Machinery and Tools in Operation July 31, 1911, Patents, Licenses and Good Will	$5,781,293.27		
In Process of Construction and Installation July 31, 1911	36,276.16

In the RETAIL WORLD

Salesrooms and a garage, 35 x 155 feet, are to be built in Newark, N. J., at 380-80½ Central avenue, for Joseph L. Feigelman; the approximate cost is $12,000.

The Willys-Overland Auto Co. of Buffalo, N. Y., has been granted authority to build a three-story structure at 1075 Main street; the estimated cost is $39,000.

A. I. Reifenstein has purchased a garage in Baltimore, Md., on Madison avenue, between Lafayette avenue and Mosher street; the consideration was $15,000.

Plans are being drawn for a new garage which the Marathon Garage Co. is to build on Gilbert avenue in Cincinnati, O. The specifications name $5,000 as the cost.

The former Abbott shirt factory in Watertown, N. Y., is being remodeled for garage purposes; the occupants will be Frank L. Seaker and Elmer C. Curtis.

A garage at 626 Superior street, Antigo, Wis., which has been closed for some time, has been opened by the Service Motor Co. G. A. and F. J. Zwicky are in charge.

The Mattox Motor Car Co. of Lancaster, Pa., plans to remodel the old Odd Fellows' Building for a garage and salesrooms; it handles the Empire and Mitchell lines.

Frank Boetcher of Lanark, Ill., has sold his garage to William Puterbaugh of Cherry Grove, in the same state. Boetcher will locate in Polo, another Illinois town.

Fred H. Berold of Cincinnati, O., has leased a site at Gilbert avenue and Rogers place, on which he will erect a two-story garage; the expenditure will be $18,000.

W. A. Horrell, formerly of Los Angeles, Cal., has entered the truck field in Phoenix, Ariz., as Mack and Saurer dealer; his salesrooms are at 235 West Washington street.

M. & A. Garage is the style chosen for a new business in Macomb, Ill. The initials in the firm style are those of the proprietors, J. C. McDonald and Joseph Atherton.

A. D. Bothe has formed an automobile agency in Des Moines, Ia. He will distribute Great Western cars locally and will have the state agency for Universal trucks.

The Anderson Storage & Garage Co. of New York City, an incorporation, has dissolved voluntarily; papers were filed in the office of the secretary of state last week.

C. A. Bond, of Lawrenceburg, Ky., has secured permission to build a brick garage in Lexington, in the same state, at Main and Spring streets; it will cost $7,500. When completed it will be leased by Barnett & Son.

Permission has been granted to Julius Straus of Milwaukee, Wis., to build a garage, store and apartment building at Downer and Hackett avenues; it will cost $45,000.

E. E. Hileman, of New Castle, Pa., is organizing a selling company in Sharon, in the same state, to handle Studebaker cars. The salesrooms will be in the Layton Garage.

Bids are being received for a garage which is to be constructed by John Weilesbacher of Pittsburgh, Pa., at 13th and Carson streets; the dimensions are 50 x 100 feet.

Charles F. Smyth, of Wichita, Kan., has purchased a half interest in the Cadillac agency in that city from George W. Denton; the firm is located at 114-16 North Topeka avenue.

The Atlantic Garage Co., of 32 Hampton avenue, Brooklyn, N. Y., is having plans drawn for a garage, 80 x 100 feet, which it will erect at Atlantic and Albany avenues; the cost will be $7,500.

The Yager Motor Car Co. of Louisville, Ky., is about to build a garage and salesrooms, 90 x 50 feet, at Third and A streets; the company sells Hupmobile, Peerless and Columbus Electric cars.

George A. Allen, secretary-treasurer of the Staunton Motor Co., of Staunton, Va., has sold his interest to J. L. Baugher; the business will be continued as heretofore at 107-9 South New street.

Contracts have been let by the Charles Schiear Motor Car Co. of Cincinnati, Ohio, for a one-story stone, brick and steel garage to be built at 3705 Montgomery road; the contracts total $5,000.

J. A. Udall, Jr., and Harry Lawrence, Jr., owners of the Patchouge (N. Y.) Garage Co., are building a new garage at North Ocean avenue and Oak street; it will contain 6,000 square feet of floor space.

The Pope-Hartford Co. has been organized in Boston, Mass., to handle the car of that name; George L. Dodd is president and Charles E. Cousens treasurer. The company will locate at 591 Boylston street

Upon the petition of the Firestone Tire & Rubber Co. of Akron, O., the Ehle Tire Repair Co., of Council Bluffs, Ia., has been placed in the hands of a receiver; W. A. Groneweg was named by the court. The Akron concern claims an indebtedness of $3,690.57 for goods sold and delivered.

The Nyeberg Automobile Sales Co. of North Carolina, recently organized to handle Nyberg cars in that state, is to open salesrooms on Patton avenue, in Asheville. The company comprises John B. Rumbough, R. R. Reynolds and Gilliland Stikeleather. Rumbough will handle the Nyberg locally in a new garage on North Main street.

John Stone, formerly connected with the Independent Auto Repair Co. in Lincoln, Neb., has entered the trade for himself in Des Moines, Ia., under the style Stone Auto Repair Shop; his location is 812 Walnut avenue. Stone is building, for use in his business, a car which will have a wheelbase of 155 inches, tires 41 x 5 inches and a 60-horsepower motor.

The Cadillac Automobile Co. of Cleveland has been organized to take over the Cadillac agency in that Ohio city hitherto possessed by the Barger Automobile Co., of 1728-34 Euclid avenue; T. H. Towell is president of the new company, which has a capital stock of $50,000. Towell, also, is president and treasurer of the Eclipse Musical Co., talking machine dealers.

The Indianapolis Automobile Clearing House, which deals solely in used cars, has been incorporated. E. J. Kane, manager prior to the incorporation, becomes president, and T. E. Byrne, his assistant, has been made vice-president, and John L. Duvall, cashier of the Marion County State Bank and vice-president of the Home Insurance Co., secretary and treasurer.

The New England Garage Co., of 230 Main street, Hartford, Conn., which has been conducted by Owens C. Wolfe and W. E. Kelton, will hereafter be operated by Wolfe, who has purchased Kelton's interests and who will continue to handle Cutting cars. Kelton, who has done considerable territorial work for the Cutting Motor Car Co., will devote all his time to that service, in the capacity of New England representative.

WELL-FILLED LIST FOR BOARD OF TRADE SHOW

490 Exhibits Assured for New York Show in Garden and Palace—Boston and Chicago M. A. M. Allotments.

If ever there was any doubt concerning the ability of the Automobile Board of Trade to fill both Madison Square Garden and Grand Central Palace at the same time, it was quickly dispelled when on Thursday last, 3rd inst., allotment of space was made for the 13th annual automobile show which is to be held concurrently in the two buildings and for which one ticket of admittance will suffice.

Altogether there were 490 applicants for space. Of this number, 87 are manufacturers of pleasure cars, both gasolene and electric, and 403 are makers of parts or accessories. Last January, in the two buildings, there were just 100 exhibitors of pleasure cars represented, which, with 398 exhibitors of accessories, brought the grand total up to 498, or 8 more than have signed up for the combined show next January. But though the list for the coming show thus is slightly shorter than it was for the last show, it is a very little shorter and there scarcely is any doubt but that belated applications for space from manufacturers will cause the present list to overtop the last one by a goodly margin. The pleasure car week of the show will be opened on January 11 and the two buildings together will house the following cars:

Oldsmobile, Lozier, Stoddard-Dayton, Oakland, Flanders, Franklin, Stearns, Pope-Hartford, Stevens-Duryea, Peerless, Locomobile, Mitchell, Winton, Cadillac, Buick, Packard, Hudson, Maxwell, Overland, Pierce-Arrow, Chalmers, Reo, White, Cartercar, Warren, Marmon, Garford, Columbia, Moline, Thomas, Premier, Pullman, Alco, Jackson, Mercer, Auburn, Haynes, S. G. V., Cunningham, Knox, Moon, Matheson, Selden, National, Abbott-Detroit, Velie, Imperial, Cole, Interstate, Case, Hereshoff, Krit, Cutting, Kissel, Paige-Detroit, Speedwell, Pathfinder, Austin, Regal, Buffalo electric, Flanders electric, Columbus, Metz, Studebaker, Fiat, Hupmobile, Kline, Henderson, Michigan, Benz, R. C. H., Bergdoll, Stutz, American, Rambler, Ohio, Crow, Edwards, Atlas, Lenox, Davis, Paterson, Marathon, Havers, Westcott, Only, and Marion .

As usual, the Motor and Accessories Manufacturers, Inc., allotted the space opportioned to it not only for the New York show but for Chicago and Boston exhibitors as well, dealing, of course, only with its members and not with the unaffiliated accessory manufacturers. Of the 202 members to whom space was allotted, 111 will be represented in Madison Square Garden during both the pleasure car and commercial vehicle weeks; 47 will be represented only during the first week. Twelve members have signed up for both weeks in both buildings and six for one week in both buildings. In Grand Central Palace, 16 will be represented for both weeks and 10 for the first week only. For the Chicago show, 110 have been allotted space for both weeks and 39 for the first week only. For the Boston show 37 have taken space for both weeks, 35 for the first week only, and 2 for the second week only.

Eighteen More Enrolled in M. A. M.

Eighteen applicants were elected to membership in the Motor and Accessory Manufacturers, Inc., at the meeting of the board of directors held in the organization's New York offices on Friday last, 4th inst. They are as follows: Bijur Motor Lighting Co., New York, N. Y.; Endurance Tire & Rubber Co., New York, N. Y.; Edward G. Budd Mfg. Co., Philadelphia, Pa.; Brown & Sharpe Mfg. Co., Providence, R. I.; Hartford Machine Screw Co., Hartford, Conn.; Simms Magneto Co., New York, N. Y.; Ignition Starter Co., Detroit, Mich.; Walpole Rubber Co., Boston, Mass.; New Jersey Car Spring & Rubber Co., Jersey City, N. J.; Hess Steel Castings Co., Bridgeton, N. J.; Schoen-Jackson Co., Media, Pa.; Gould Storage Battery Co., New York, N. Y.; New Miller Carburetter Co., Indianapolis, Ind.; Marathon Tire & Rubber Co., Cuyahoga Falls, O.; Electric Auto-Lite Co., Toledo, O.; Baldwin Steel Co., New York, N. Y.; Pittsburgh Model Engine Co., Pittsburgh, Pa.; Garage Equipment Mfg. Co., Milwaukee, Wis.

Corporation Takes Over Poyer Truck.

Due to the retirement of W. S. Carpenter, the firm of D. F. Poyer & Co., of Menominee, Mich., which built motor trucks on a comparatively small scale, has been made into a corporation of the same name with $75,000 capital stock. Its officers are: D. F. Poyer, president and manager; Fabian Trudell, vice-president, and H. T. Emerson, secretary and treasurer. The business will be continued on the former lines but on a larger scale.

Pathfinder Gets Into Great Britain.

To handle the Pathfinder car, made by the Motor Car Mfg. Co., of Indianapolis, the Pathfinder Co., Ltd., has been organized in London and has opened up at 12 Heddon street. Originally the Pathfinder was introduced into Great Britain by Claude M. Nankivel, of London.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve To Place Many Workers In New Places—Few Leave the Industry.

Benjamin A. Rhodes, superintendent of the Dayton Motor Car Co., of Dayton, O., has resigned that position. He had been identified with the Stoddard-Dayton organization for a number of years.

George H. Brown, sales manager for the Mather Spring Co., whose offices have been located in the Ford building in Detroit, has returned to the factory at Toledo, from which henceforth his efforts will be directed.

A. T. Carnahan has been appointed district manager for the Swinehart Tire & Rubber Co., with headquarters in Detroit. He succeeds S. G. Andrews, who resigned to enter the retail trade at Saginaw, Mich., where he will handle Studebaker automobiles.

W. E. Rice has been appointed sales and advertising manager for the Schoen-Jackson Co., of Media, Pa., which already has placed the Feps carburetter on the market. Previously Rice was associated with the Atwater-Kent Mfg. Works of Philadelphia.

Guy Vaughan, former engineer for Wyckoff, Church & Partridge, Inc., of New York, and partial designer of the car which bears his name, has joined the engineering staff of the Olds Motor Works, of Lansing, Mich. While skilled as an engineer, Vaughan is best known because of his fame as a racing driver.

A. N. Lawrence, former sales manager of the Motor Wagon Company, Detroit, has been appointed sales manager for the Ford Motor Company of Canada, with headquarters at Walkerville, Ont. H. Nelson Dunbar, who served as sales manager of the King Motor Car Co., also has become a member of the Ford staff. He, however, will be identified with the parent company in Detroit, where he will perform the duties of assistant sales manager.

Daniels Moves to Detroit and Expands.

W. Smalley Daniels, who for a number of years acted as manufacturers' agent in Boston, Mass., has removed his business to Detroit, Mich., where it will be continued. He also has formed the W. Smalley Daniels Co. of Michigan to take over the sales business of the Snyder-Harbridge Sales Co., of Detroit.

NEW YORK, OCTOBER 10, 1912

GETTING THE MOST OUT OF SALESMEN.

Undoubtedly there are men who are salesmen or merchants by intuition. More of them, however, are the products of training or experience, and the need for training now generally is recognized.

No better evidence exists of such recognition than the systems evolved by not a few manufacturers of automobiles, which are designed to train their dealers in the way they should go, or in other words, to assist them to make sales, which is but another way of assisting them to become better merchants. An illustrious example of such a system, employed by one of the largest corporations in the industry, is dealt with in considerable detail in another column.

The dealer who makes the most of such systems cannot but become a better merchant. That many of them fall short of reaping the full results, however, is only too plain. They permit the assistance to stop short, that is, to stop at their own desks; they too often fail to allow their own salesmen to share the benefits. In fact, it is not too much to say that the average merchant depends too greatly on what may be termed the intuition of his employes. Rarely does he attempt to instruct them and thus to increase their efficiency. It is a too common failing of too many retail organizations when the business is worthy of being dignified by the term "organization," and it is largely responsible for the high average of mediocrity which prevails—for the preponderance of "order-takers" over salesmen.

Some men there are who are quick to profit by experience and any observation of their fellow-salesmen. There are more men who, if properly taken in hand and given some form of training, would develop into equally capable salesmen. Comparatively few employers consider such training worth while. Usually the first knowledge that he is lacking is conveyed to the salesman by notice of his discharge. Seldom is he ever then told or shown the methods by which he may mend his ways. Few men who have worked for a salary can recall any very numerous or very conspicuous instances when their employers more than casually pointed out to them how better certain tasks might be performed, or offered helpful suggestions or instructions. That is one reason why so many employes lack initiative and await "orders," or fear to take the initiative or otherwise exhibit self-reliance.

Excepting only the "born salesman" or the salesman by intuition, the average man requires instruction of some kind, and the man who sells either automobiles or automobile accessories is no exception to the rule. If more dealers displayed real interest in their salesmen, and trained them in the way they should go, the practice could not fail to result in that increase of business and profit which all merchants seek.

It is a fundamental of successful merchandising that salesmen should be told not merely what to do but how to do it. The men who possess the combined knowledge are the men who rise or have risen above the level of average salesmanship, and who have attained to higher things. Merely employing men and instructing them to "sell goods," or "sell tires," as the case may be, is not sufficient. If they are not instructed how best to sell them, and sales are lacking, a portion of the fault, at least, rests on the man who employs them, or on the man who is placed at the head of a particular department. Failure to do that sort of thing usually is the reason why men who fail in one place often make brilliant successes in other places. They possessed the latent ability but it required judicious and intelligent coaching to develop it.

On top of statistics showing record-breaking crops, the financial oracles who deal with such things report that in the matter of dividend distributions, the year 1912 will surpass 1911 by no less than $150,000,000. As dividends generally are considered to be "easy money," and saying nothing of the revenue derived from crops, there should be more money available for the purchase of automobiles than ever before, even when or where they are viewed in the light of "luxuries."

The first instalment of the articles dealing with the used car problem appear in this issue. The fact that the author of one paper is the president of one of the best known automobile manufacturing companies and the other a dealer in a small town, suggests the wide interest that prevails, and should inspire other men in similar stations to contribute their views.

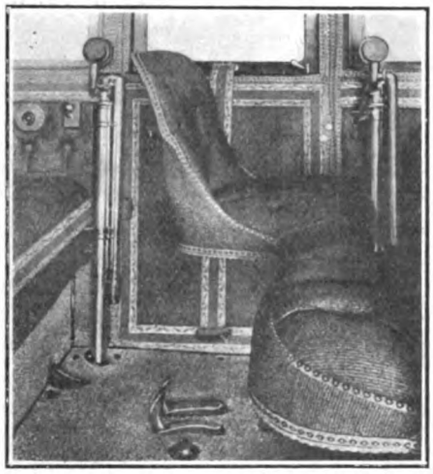
TWO MOTOR INSURANCE COMPANIES INCORPORATING

Prominent Men of Automobile Trade To Figure as Directors—Culmination of Long Effort—Dealers' Support To Be Sought.

Two years' work—most of which was performed by Ernest H. Greenwood, in Philadelphia, where the movement was originated by several of the most prominent automobile dealers—is about to culminate in the organization of two insurance companies of and for the automobile trade With the aid of Massachusetts capital, they are now on the point of being incorporated under the laws of New York State.

One is styled the National Motor Indemnity Co. and will be capitalized at $800,000 and will write insurance against loss or damage by everything save fire, including accident liability by owners. The second corporation will be styled the National Motor Insurance Co. and will be capitalized at $500,000; it will insure automobiles against fire, although its powers will be so broad as to permit the insurance of other goods as well.

The par value of the shares of each company will be $100. The Indemnity company will have a surplus of $400,000 and the Insurance company a surplus of $250,000, both capital and surplus being fully paid in cash in each case.



The ownership and control and management of both companies will be identical. W. J. Bryce will be chairman of the executive board of the new companies. The first board of directors will be constituted as follows: A. G. Batchelder, Alfred Reeves and S. A. Miles of New York; A. L. Pope of Hartford, Conn.; Winfred J. Foss, E. B. Jackson, Ernest H. Greenwood, A. E. Maltby and George W. Hipple of Philadelphia; W. P. Berrien of Pittsburgh; Chester I. Campbell of Boston; Thomas Henderson of Oberlin, O.; Hugh Chalmers and W. E. Metzger of Detroit, and William B. Joyce, James C. Colgate, William A. Tucker, Franklin Q. Brown, Alexander M. White, Charles H. Sabin, Henry E. Cooper, H. C. Wright, William A. Gaston, Eugene V. R. Thayer of Boston.

Messrs. Metzger, Chalmers, Henderson, Pope, Reeves, Miles and Batchelder will be recognized as national figures in the automobile industry, while Messrs. Foss, Jackson, Maltby and Hipple of Philadelphia, Berrien of Pittsburgh and Campbell of Boston are prominent in the trade of their respective localities.

Both of the companies have been formed with a view of actively interesting automobile dealers in the sale of insurance. It is believed that when they sell cars automobile dealers most readily can impress owners with the importance of insurance and at the same time sell insurance policies almost as easily as they now sell tires or accessories

Little Known Features of Well Known Cars

Usual practice with regard to the seating arrangements in electric coupes which are designed to carry four passengers involves the placing of the seats front and rear so that the passengers face each other Naturally the passenger who faces the operator partially obstructs the view of the road, which scarcely can be termed desirable.

OHIO ELECTRIC DUAL CONTROL

The designers of the Ohio Electric, however, have overcome this objection to the four-passenger coupe in a very ingenious manner—simply by placing a second set of controls—steering column, brake pedals and controller disk—so that they can be operated from one of the forward seats, which, as is shown in the photograph, is made rotatable so that the driver faces forward when he is guiding the car.

When but two passengers are in the car, the driver guides the machine by means of the rear controls, and the forward seat is turned around so that it faces the driver after the orthodox practice. When the car is taxed to its full carrying capacity, however, a key releases the forward controls and at the same time renders those positioned at the rear seat inoperative, and the driver drives from the forward seat with his view of the road unobstructed. Naturally the fourth passenger occupies the rear seat formerly occupied by the driver.

October 12, Poughkeepsie, N. Y.—Track races under the auspices of E. W. Powell.

October 12, Providence, R. I.—Track races under the auspices of E. O. Hustudt.

October 12, Chicago, Ill.—Inter-club run of the Chicago Automobile Club and the Chicago Athletic Association.

October 12, Salem, N. H.—Road races on the Rockingham Park course under the auspices of the Salem Automobile Club.

October 12, Springfield, Ill.—Track races promoted by the Illinois State Board of Agriculture.

October 12, Salem, N. H.—Track races promoted by the Rockingham Park Automobile Club.

October 14, Des Moines, Ia.—Start of the Iowa State Automobile Association's reliability run.

October 19, Narbeth, Pa.—Track races under the management of F. D. Hall.

October 21, Chicago, Ill.—Chicago Motor Club's reliability tour around Lake Michigan.

October 21-25, Chicago, Ill.—Chicago Motor Club's reliability run.

November 8-16, London, England—Society of Motor Manufacturers and Traders' annual show in Olympia Hall.

December 7-22, Paris, France—Paris Salon.

THE USED CAR PROBLEM

Two of the Solutions Offered

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Four Best Articles Dealing With the Subject.

By H. H. FRANKLIN, President H. H. Franklin Mfg. Co., Syracuse, N. Y.

The solution of the used car or second-hand "problem" gets down to just one thing and that is to handle it on a sound business basis.

And what is that? Simply this: in purchasing the used car (or taking it in trade, which is the same thing), pay or allow for it only such price as will permit its re-sale at a profit.

There is no other plan that will work. If all dealers would do it that way the whole problem would be taken care of. Any individual dealer who does it solves **his** problem.

Motor World may give the $50 to the first worthy charity solicitor who calls on you.

By GLENN H. FOOTE, Automobile Dealer, Ransomville, N. Y.

In treating the subject of used cars and their disposal, which every dealer will admit is one which must be reckoned with, let us grant the fact; and instead of trying to suggest a remedy for the situation, see if we cannot find a method of removing the cause.

For instance: If any dealer supposes that by aiding a would-be customer in disposing of a car, by taking it in trade or finding a buyer, he is broadening his market, he is mistaken; for nearly every used car disposed of fills somebody's need of an automobile for some time to come.

Again: The system of automobile education which teaches that a man of means must change his car every year, or at the most every second year, to prevent losing caste or to avoid being called the driver of an "old rattletrap," regardless of expense—as his wife changes her hat from season to season—is a fallacy which should be exploded.

When a farmer purchases a harvesting machine he expects to use it for its natural life, which is from ten to twenty years. Such machines have to work under most strenuous conditions and breakages are frequent—in fact, much more so than on an automobile—but if they were thrown on the market every second or third year after manufacture, it would certainly add a demoralization to the business which does not now exist.

The principal trouble is that the automobile industry has grown so fast, that like a growing boy it is out of all sense of shape and proportion.

If after all the good things said about the car by the salesman, the buyer receives a machine which is only suitable for him to use a couple of seasons, the industry will hardly stand the searchlight of reason for its economic existence, even if treated as a luxury. Would it not be wiser, by calling his attention to numerous examples, to show a prospect that he can get many seasons' satisfactory use from his machine if it is properly taken care of? To call his attention to adjustments provided and make him feel that regardless of any loose statements made by some "interested" repairman, the car can again be made to run smoothly, giving many miles of satisfaction to its driver, after it has reached a point where it needs overhauling?

So many "wooden" men are posing as "expert" repairmen, that the owner gets his used car from the shop, pays his bill, and then disgusted with its performance, registers a vow that he will sell it if possible, or give it away if necessary—with an even guess that he puts throught a combination of these two. With the possible exception of factory rebuilt cars, is not the above condition the rule rather than the exception? And is it any wonder that it is difficult to market this sort of "junk"?

What we need is more and better repairmen, those who have the ability and willingness to take an interest in the job in hand, from the owner's standpoint, and guard its various stages as an architect would guard the construction of a building for its owner.

Few owners will then feel it necessary to exchange cars, while their own is running in good condition, and the man who sells such cars can point with pride to the long and consistent record of cars which have come under his notice, instead of having to make excuses for the short duration on earth of some car which he may have sold, and which if nothing further, causes the purchaser to enter into his new relation with fear and trembling for his financial future.

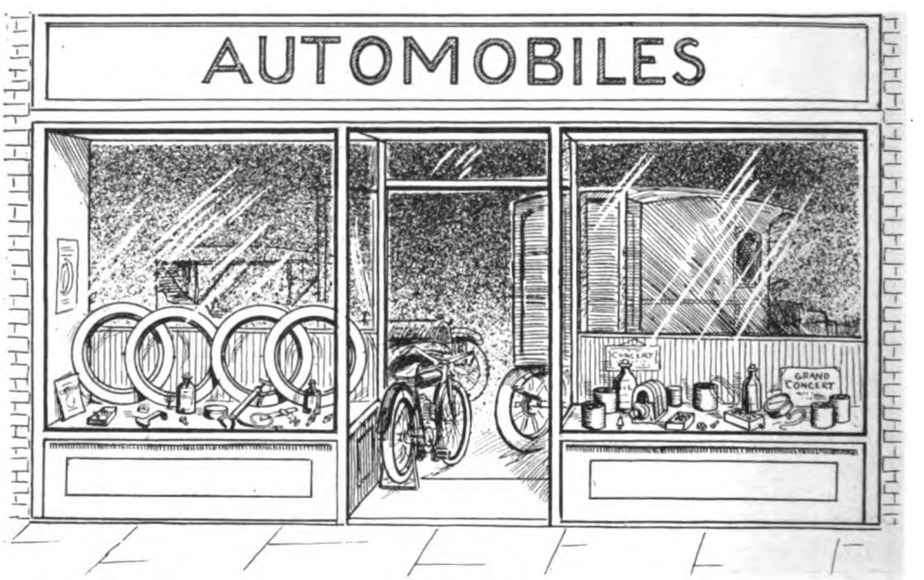
WIDE-AWAKE MERCHANDISING In the MOTOR TRADE

TERRITORY; SIZE VS. CULTIVATION.

There is such a thing as having too much territory just as there is such a thing as having too large a garden.

If a dealer can sell twenty-five or fifty cars in the immediate vicinity, it is much better than selling the same number over a widely scattered area. It costs less to sell them. A compact territory is usually much easier to work and always is more profitable.

One Ohio dealer, who is typical of a great many others, found that when he had made good in his own comparatively small territory it was an easy matter to get as much more as he wanted. This man employed one good salesman. He attends to the home territory while the salesman keeps on the road all the time, winter and summer.



It takes nerve to pay the salary and road expenses of a man during the winter months, when cars are not moving out fast, but it paid this dealer—paid him big. Likewise this dealer discovered that the small dealer who makes good is the man who takes a little bit of territory and works it to a finish. Instead of one or two cars in a county, he sells fifteen to twenty-five in a season. And the more he sells, the easier it is for him to keep on doing a profitable business and the harder he makes it for competition.

Often the small dealer needs help—service help or sales help; hence the large dealer or wholesale dealer must leave himself enough margin to provide such help and service.

A big garden is a glorious prospect. But a small garden intensively cultivated is not so hard to keep in order, and, if carefully planned for successive crops, will outyield mere acreage. This is a picture of the territory question. The great thing is not the amount of territory but what you do with it—how many cars you are capable of disposing of in the territory.

WINDOW DISPLAY THAT DISCOUNTS.

Place: Toledo, Ohio; Jefferson avenue.
Scene: Window of Automobile Store.
Time: Morning of 26th day of September, in the year of our Lord Nineteen Hundred and Twelve.

TOLEDO SHOW WINDOWS AS "HORRIBLE EXAMPLES"

PROPERTIES.

Left Window: Four big tires, overlapping. Screen of flycloth for background. Cement, bottle of oil, tire pump, tire iron, car polish in bottle, and eight other articles struggling for attention.

Right Window: Background, one unwashed delivery car. Five cans of assorted washers, several cans of lock-nuts, likewise several boxes of cotter pins, two big bottles (apparently oil), speedometer, gas headlight tip, magneto, piece of wire, and enough other items to make up 22 different articles. One or two cards advertising concerts.

Doorway: Jammed by one motorcycle and rear end of unwashed delivery wagon. Only thin persons allowed in. Fat customers who seek admission, please call again.

Question: Could a larger number of different things be put into windows? Did the office boy do the trimming? Or were the windows trimmed at all?

Suggestion: Keep all cars on display clean. Cut down variety of window display about 80 per cent. Change often. Use neatly lettered window cards to advertise your own business; let the concerts advertise elsewhere and give you a chance. Keep windows clean.

KEEP OFF FLOOR SALES UNLESS INVITED IN.

It is bad business for the "boss" or anyone else to "butt in" on a salesman who is treating with a prospective purchaser.

Digitized by Google

AWAKE NDISING WORLD

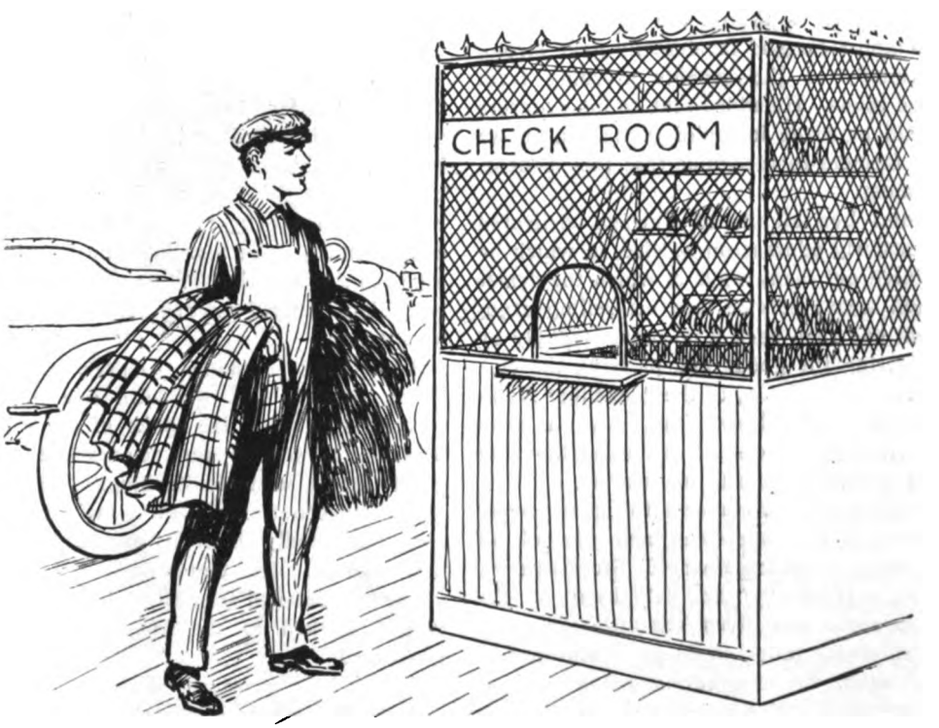
There is such a thing as being too eager to close a sale. Where anxiety is manifested the prospective buyer is more than likely to become chilled. The good salesman will move calmly and confidently to the end.

Sometimes a fellow-salesman on the floor grows nervous, and thinking the other fellow is too slow, he moves up, wedges abruptly into conversation by asking some such pointed question as "Did you notice the Turkish cushions?"

This is not the method of good salesmanship. The trained man will wait till he is invited or signaled. Then he gets on the job with both feet.

DON'T BUY PROSPECTS; DIG THEM UP.

The fellow who sneaks into your office, tells you that he has a prospect for your car, and wants to know how much you will give him for the name, ought to be rewarded with a pointed invitation to make himself scarce. In nine cases that is exactly what he has earned—not one jot or one tittle more.



Agreeing to pay commissions for a name, only to find that it is a prospect you have been working on for months has happened a bit too often. It is going to happen less in the future. Dealers are getting posted on the methods of business fakers. It is for the good of every dealer that they be eliminated for all time.

The commission that is allowed by the manufacturer belongs to the dealer. Out of it must come selling expense, store rent, overhead, salaries and, incidentally, a reasonable amount of service. If, in addition, the dealer has to split with someone for a name or a boost, there is little real profit in the sale.

Alert, active dealers find no difficulty in getting names of prospects. It is simply a case of "digging for information" and watching. The best prospects are not those that everyone knows about, but the ones the other fellow never thinks of. Go after them all, but go hardest and fastest after the "pure gold" prospects you yourself have dug up.

PROVIDE A CHECK ROOM FOR LOOSE ARTICLES.

Hyslop Brothers, of Toronto, Canada, who sell the Cadillac, have one of the most completely equipped garages in the Dominion, and there is one unusual feature of the establishment which instantly commends itself to transient customers—that is, their check-room.

CHECK ROOM IN HYSLOP GARAGE IN TORONTO

When a tourist drives in for storage overnight all of his loose extras, such as spare tires, robes, packages, etc., are removed by the attendant and stored in a checkroom. There never is any trouble finding the articles checked and the count always is right. The tourist sleeps peacefully and quietly, knowing that his valuables are safe.

In the morning, he presents his checks and receives his goods and chattels and goes on his way rejoicing over having found one of the most business-like garages on the continent. No charge is made for this convenience despite its obvious value.

Signs reading "We are not responsible for anything left in car" are too common in garages. But most of them fail to provide either a check room or lockers. Such a move as that made by the Hyslop brothers certainly is a step in the right direction; it is not going too far to say that it is even worth charging for and worth paying for.

AUTOMOBILE SALES ASSOCIATION FORMED AT INDIANA CONVENTION

(Continued from page 5.)

dealer and is losing money because he had to give service on old cars out of the profits which had been enjoyed by a dealer of other days.

One of the addresses that made a great hit was made by E. Le Roy Pelletier on the "point of contact." Pelletier was in his best style and gave some practical illustrations of how the dealers' salesmen often fail to hitch up with the best laid selling and advertising campaigns. He emphasized the fact that the dealer is of utmost importance as he is the final point of contact with the public, and upon him and his salesmen depend everything. C. W. Kettering, of the Dayton Electrical Laboratories Co., urged that the dealer and his salesmen study more the story of the motor car and its evolution from crude metal into a highly sensitive and efficient mechanism, suggesting also that in a similar way interest can be created by an intelligent salesman in the story of rubber from the Amazon to the finished tire.

Charles A. Bookwalter, former mayor of Indianapolis, spoke on the development of the motor car and incidentally gave strong testimony to the benefits accruing from good roads. He added that no big progress would be made in building roads until we got farmers to recognize that they benefited most.

John Lee Mahin, of Chicago, delivered a masterly address on service, in which he pointed out many ways in which the dealer could weave service into his selling argument and then back it up more strongly by delivering the goods and pleasing the customer. J. G. Jones, of the Alexander Hamilton Institute, New York, gave a clean cut strong address on salesmanship that went straight home to his hearers.

During the noon recess the guests were driven to the Speedway and partook of luncheon, at which Harry C. Stutz was the host; incidentally, an exhibition of the Stutz speed was given, the little car going seventy-nine miles an hour. Returning to the hotel, the convention reconvened at 2:30. W. D. Nesbit, who previously had acted as chairman, being replaced by J. G. Monihan, of the Premier company.

The first speaker of the afternoon was William Boyd, of Curtis Publishing Co., Chicago, who said that in addition to the other points of quality and construction the dealer should rigidly inquire into the manufacturer's advertising policy and make his decision on the basis of his reply. Boyd said advertising was essential to salesmanship and showed why he said that the greatest potential buying power was that created by advertising. John C. Wetmore, of New York, urged dealers to cultivate local newspaper men and to advertise frequently as possible, but above all things to use large space even if they had to use it less often.

C. W. Seiberling, of Goodyear Tire & Rubber Co., remarked that he was head of the "department on visions"; in other words, it is his business to peer into the future, and he prophesied that in five years the automobile and accessory industries would surpass in volume the annual earnings of all railroads put together. He said that in the dealers' own hands rests the remedy for any trouble he might be having and urged them to closer study of problems. He said that the salesmen of the future will be higher grade and will talk steels, for example, back to the mines, and tires back to the forest.

The addresses all emphasized honesty, sincerity, integrity and belief in and support of manufacturers' policies, elimination of knocking, and the creation of a boosting spirit, as necessary for selling success; also the necessity of dealers co-operating with one another and maintaining list prices, and of their being guided by wider experience of the manufacturer in the way of exploitation.

The important thing about the convention was the fact that it was able to draw about one hundred and fifty dealers and that the subjects were all handled in a broad, thorough manner, without any cars being mentioned by name. There was, of course, much to be learned about conducting such a convention, but as a whole it was splendidly handled and reflected credit upon its sponsors.

Advertising Manager Depree, of the Remy Electric Co., was also one of the forceful speakers. He spoke of the salesmanship of service and remarked that a great many misunderstandings could be straightened out and business facilitated by courtesy, kindly interest and diplomatic conversation. He emphasized the latter virtue and detailed several instances of how it had worked to the satisfaction of all concerned.

Eight Extensions of Overland Factory.

Indicating the prosperity of the Willys-Overland Co., there are in process of construction at the present time no less than eight additions to its plant in Toledo. The largest of the group is a five-story concrete building 102 x 127 feet in dimensions, which will be utilized by the Kinsey Mfg. Co., one of John N. Willys's properties.

Other constructions which are now under way include a two-story concrete building, 50 x 140 feet, to be used as a repair shop; a three-story concrete building, 60 x 80 feet, for the varnishing and trimming departments; a three-story concrete building, 40 x 100 feet, for polishing, plating, pattern making and pattern storage; a two-story frame building covered with iron siding, 65 x 216 feet, for wheel painting and trimming; a brick addition to the boiler room, 34 x 48 feet, for housing two 300-horsepower boilers; a one-story frame iron-covered addition to forge shop, 32 x 55 feet, and a one-story building of steel and brick construction, 70 x 200 feet, for blacksmith shop.

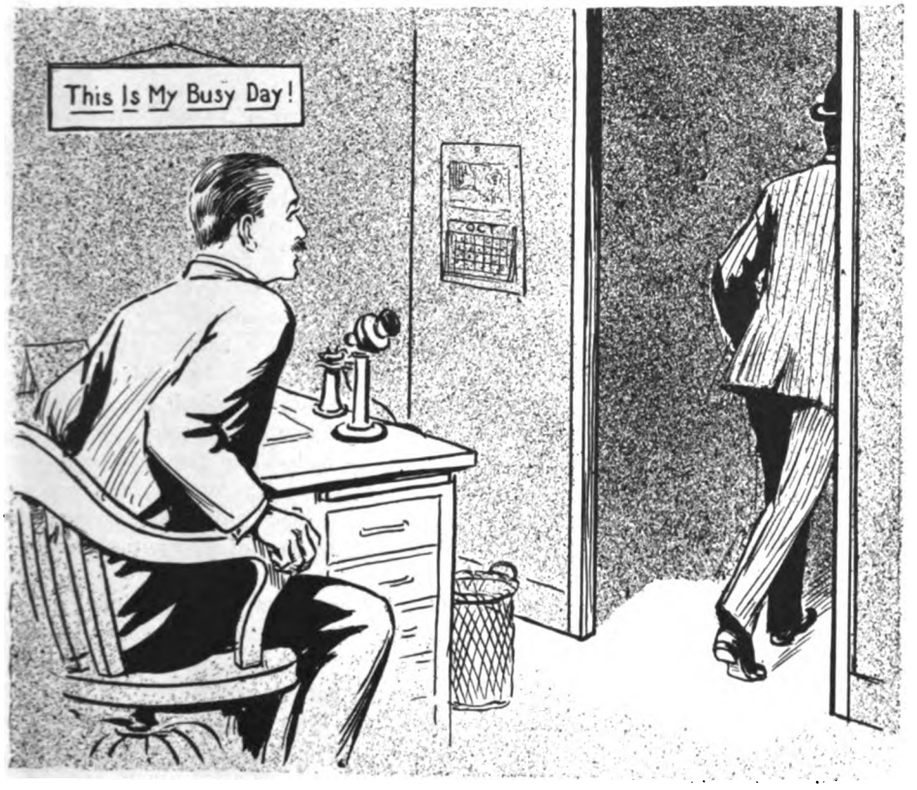
Brockway Completes Organization.

The Brockway Motor Truck Co., of Cortland, N. Y., which is an outgrowth of the Brockway carriage and wagon business, in Homer, which is near by, has completed its organization by the election of the following officers: George A. Brockway, presiden; C. S. Pomeroy, vice-president; F. R. Thompson, treasurer and general manager. The company, which is capitalized at $100,000, will produce trucks in three models—1,000-1,500, 2,000-2,500, and 3,000-4,000 pounds capacity, respectively. They will employ a three-cylinder, two-cycle, air-cooled motor, and, in the language of their manufacturers, will be "sold at a price that the average business man can afford to pay." The production of the Brockway trucks, as they will be styled, is in the hands of Rodman S. Reed, who is chief engineer and superintendent of the company, and who previously filled the same offices in the Chase Motor Truck Co., of Syracuse.

Elkhart Stockholders' Mortgage Valid.

After much involved legal turmoil, the court has declared valid the $50,000 mortgage held by stockholders of the Elkhart Motor Car Co., of Elkhart, Ind., which was adjudged bankrupt in October, 1911. Previous to the bankruptcy proceedings the company was sold for $70,000 to George G. Schofield, who then mortgaged the plant back to the company. Later, in May, 1911, the factory was again sold and it was at that time that certain stockholders filed the petition in bankruptcy, while other stockholders instituted a suit to foreclose the mortgage. A bitter fight resulted in which charges of conspiracy and threats of arrest were made, but nothing came of it.

Republic Ratifies Increase of Capital.



Stockholders of the Republic Rubber Co., of Youngstown, O., ratified the plan of the directors for an additional issue of $5,000,000 preferred stock, the receipts from the sale of which will be employed in the establishment of a reclaiming plant and other extensions of the business. The new issue makes the total capital of the Republic company $10,000,000.

REILLY DISCUSSES THE "I'M BUSY" SIGNS

Drops into the Sales Manager's Office and, Finding One on the Wall, Delivers Himself of Some Pointed Opinions—Placards That Cover Wall Space But Give Offense.

It was far from a busy day with the Sales Manager; he had cleaned up a big week's work by Friday night, and on the Saturday morning in question was just finishing clearing away the tag ends of the week's doings and, as office rules permitted smoking, he just had lighted his pipe and leaned back in his chair for a few moments of meditation when the door opened. The Sales Manager looked up to see who had disturbed his mental soliloquy and, as he had surmised from the snappy footsteps on the hallway runner without, he beheld Reilly, his star dealer, filling the doorway.

"REILLY!" HE CALLED, "REILLY, COME BACK HERE"

Reilly Reads the Printing On the Wall.

The Sales Manager had a greeting on his lips, having removed his pipe for that purpose, when Reilly, seeming to glance not at the Sales Manager but over his head and beyond at the wall, said apologetically, "O, I beg your pardon, Jim; sorry to intrude," and quickly shutting the door behind him started back toward the street where his car was standing.

The Sales Manuager was on his feet and out the door in an instant.

"Reilly!" he called. "Reilly, come back here."

Bringing Back the Departing Guest.

But the little dealer never turned or seemed to hear but kept on his way, smoothing his straggling hairs preparatory to putting on his hat. The Sales Manager couldn't account for such behavior. "Reilly," he repeated, and when vocal summoning did no good he increased his speed and at the door grabbed the dealer by the arm. "What's the matter with you this morning? Aren't you going to stop a while? What's your hurry?"

"I'm in no hurry,' 'answered Reilly.

"Well, come back and get over your grouch."

"I have no grouch."

Explanations Are in Order.

"Well, come back and get over it, anyway. What made you act like that?"

"I thought you were busy," replied Reilly, feigning an astonished look.

"Busy?" exclaimed the Sales Manager; "I haven't a thing in the world to do this morning."

"You said you were busy," retorted Reilly.

"Me? I said nothing of the sort."

"Well, the sign on the wall said so and you put it there," was the dealer's follow-up.

"That sign? Aw, forget it!" laughed the Sales Manager. "You shouldn't believe in signs."

Placards That Are Meaningless.

Back in the office Reilly pretended innocence of signs in general and explained that whereas the sign had not been there on the occasion of his last call and was there when he called this time he naturally assumed that it was hung up on busy days only and therefore was a warning against visitors who called on unimportant business. The sign read

> **This Is My Busy Day**

and according to appearances and the Sales Manager's own admission the sign lied.

"That doesn't mean anything," said the Sales Manager. "A fellow gave it to me and I hung it up there. I think it adds a touch of aggressiveness to the office."

"Maybe it does," was the answer, "but unless you believe in making yourself aggressive by offending callers, I'd advise you to take it down."

"What harm does it do?" asked the sign's owner.

Reilly On the Ethics of Signs.

"Maybe none at all, if you care to see it that way," answered Reilly, "but you'll never find one in my place. I may be busy, but I'm never too busy to talk business of any kind and I do not intend to offend any caller by making him think I want him to cut his call short. If he tries to drag things along on unimportant matters and I really am busy I tell him so and ask him to call again some time. But no

Digitized by Google

signs in my office! If I have anything to tell a man I feel that I am capable of telling him without putting up bulletins."

"Don't you think your ideas are a bit radical on that point?" asked the Sales Manager as he smiled skeptically.

"You may think so; but let me tell you my experience with signs. To start off with, putting up a sign like that is like hanging one on my demonstrator saying 'This Is an Automobile.' If it is an automobile people ought to be able to recognize it from appearances, and if they can't then I am willing to concede there is something the matter with the thing. If you are busy, do you think you need to tell people so? Don't you think that a man who comes in here and sees you up to your neck in work can tell you are busy without you hanging a sign around your neck saying that you are a busy man. Just because you're a good friend of mine and don't dare get mad at me I will say that those signs make me sick—not ill, but sick!

Early Experience With the "Motto" Fad.

"When I started in business there were times when I was as busy as you are this morning, but I liked to believe I was a wildly rushing business man, so one day when I was in a book store and spotted a sign I paid ten cents for it and put it up in my office. Mine read

My Time Is Valuable. Is Yours?

which may or may not have been true.

"I felt real perky every time I saw that sign; it made me think my time was valuable, but, heaven knows, there were times when I had a hard job making myself believe I was busy, but since the sign said so I thought it must be true. One day a business man whom I knew by sight hurried into the office. I was about twenty-five years old then; he was twice that. He opened the office door, opened his mouth to speak and then closed both his mouth and the door—if I remember correctly; both of them slammed. I couldn't move for almost a minute, the shock was so sudden. I wasn't accustomed to having customers act that way. However, I gradually recovered my composure and decided that as important a business man as I was ought not to be flustrated.

Killing Off a Live Prospect.

"True to the mental promise I had made myself, I forgot all about the incident. But one day I learned what it was all about. A friend of mine came to me and told me. The man who made such a sudden dash out of my office had told my friend. He came in intending to buy a car, or at least look the line over. He was one of these self-made men and really was a very busy individual. He always worked at high pressure and was a little high strung; so when he saw the sign on my office wall, intimating that my time might be more valuable than his he got hot and left on the spur of the moment. And he never came back, either; and I might add that he bought a car—but not of me.

"That was only one of the many things I learned in my business bringing up. That sign came down. Its fall was on the principle that it certainly didn't do any particular good and might do some harm. It's like an unfriendly dog; he might wander around for years and do neither good nor harm, but the chances in favor of damage are too great. Probably not one man in ten would have acted as my customer did, but if even one man in one hundred who comes into my place buys a car it's a big help to my business.

Signs That Say What the Owner Wouldn't.

"It is a peculiar thing about business offices to-day; they seem to be badly smitten with this motto fad. The cards say everything from 'Be Brief' and 'Smile, Damn You, Smile' to 'I'm Married.' The first two you wouldn't dare say to a stranger if he walked into your office and the last one is a confession that would make you feel foolish if you were compelled to repeat it like a parrot to all your visitors. It even may be funny, but lots of 'funny' men don't need 'I'm Married' signs; their looks are enough.

"You put up that sign because you were thoughtless; you never considered whether it did good or harm. You fancied it gave a 'punch' to the office. Of course, I was only kidding when I turned on my heel as I saw the sign, but it only shows what some men may do and I am darned sure a lot of men would like to do. You yourself have seen those signs in offices where you have called, and I'll guarantee that if you stop to think you will admit that they never appealed to you when they were on some other man's wall and that they made you feel uncomfortable whenever one stared you in the face. Am I right or wrong?"

The Wind-Up in the Waste-Basket.

"Well, you are at least half-right, anyway," responded the Sales Manager. "I do recall the sensations I experienced when entering offices and seeing such things hanging before my face."

"Then the sign's a liar," said Reilly.

"In the Ananias Club sure!" answered the Sales Manager, and he made no protest as Reilly lifted the offending pasteboard from the pin that held it and gingerly deposited it in the waste paper basket where it belonged.

Goodrich Facilitates Tire Repairing.

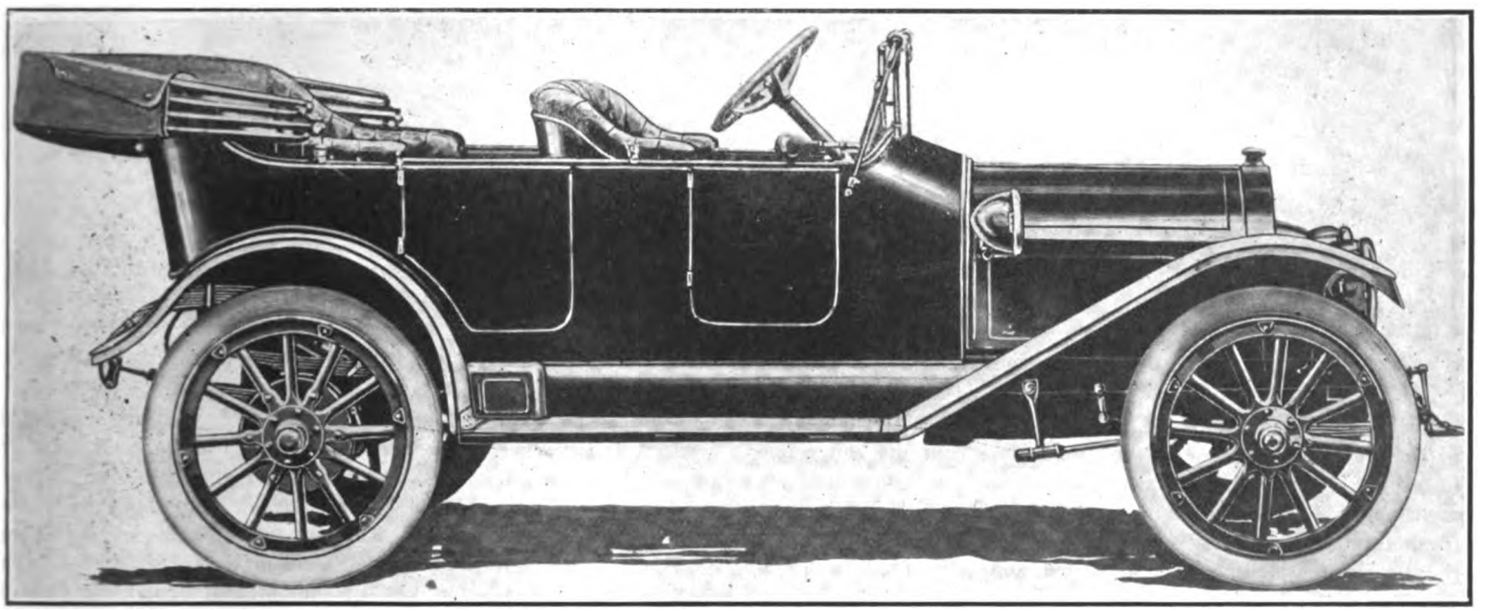
To assist understanding of the subject, the B. F. Goodrich Co., of Akron, O., just has issued "A Manual of Tire Repairing," which is so illuminative that it cannot well fail to fill its purpose and to prove of real assistance to every man who has to do with the repair of tires. It contains detailed instructions for performing practically all of the operations that are included in the category of ordinary tire repairs, such as vulcanizing, retreading, splicing, repairing blow-outs and punctures, single tube work, the handling of fabric and rubber, etc., a profusion of illustrations making clear the various processes. The manual is as handsome typographically as it is full of instructiveness.

Feature of a Texas "Sales Day."

Byers, Tex.—a suggestive name—recently inaugurated what was termed a "sales day," on which local merchants decorated their stores, paraded their wares and generally created a hurrah designed to attract buyers. One of the most striking features of the turnout was a display by the Wheeler-Davis Co., which handles the Abbott-Detroit car in Byers. In tandem fashion the Abbott dealers hitched three wagons—a surrey and two buggies—to a 30 horsepower car and loaded into them 78 men, women and children. The automobile then pulled the heavy load with ease, to the amazement of the Texans who witnessed the feat.

Ohio Chauffeurs Organize for Protection.

For the protection of both owners of automobiles and the chauffeurs themselves, which object is susceptible of wide interpretation, Ohio drivers have formed and duly incorporated the Ohio Chauffeurs' Protective Association, with headquarters in Cincinnati. The following officers were elected: President, Grover Bennett; vice-president, Charles Eckert; secretary, Roy Engleman; treasurer, George Puls; sergeant-at-arms, Dick Harms; publicity bureau, Grover Jobe.



Teamsters Strike Against Motor Trucks.

Certain of the teamsters in Chicago have assumed an aggressive attitude in opposing the introduction of motor trucks in place of horse-drawn vehicles, the first emphatic action being taken a week ago to-day, 3rd inst., when 30 teamsters employed by the Chicago Consolidated Bottling Co. refused to take out their teams. The company recently purchased six motor trucks and the teamsters demanded that the work of one truck be restricted to the work of one team.

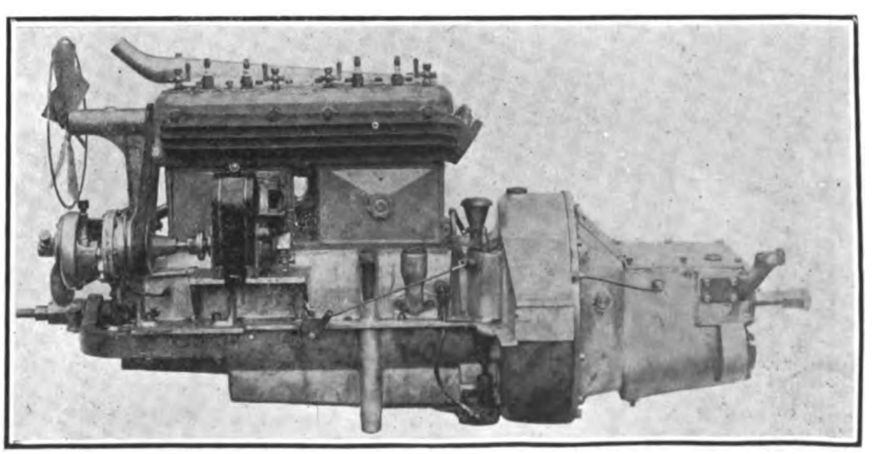
CUTTING CONCENTRATES ON SINGLE CHASSIS

Unit Power Plant on Three-Point Suspension a New Feature—Improved Disc Clutch, Longer Wheelbase and Bigger Tires on Revised Model.

CUTTING FIVE-PASSENGER TOURING CAR OF WHICH THE NEW 40-HORSEPOWER CHASSIS IS THE BASIS

Concentration of energies and expansion of facilities were the motives that governed the Cutting Motor Car Co., of Jackson, Mich., in deciding upon the scope and character of the line of Cutting cars for the season of 1913, and, accordingly, there has been an enlargement of factory capacity, while the line, which in 1912 consisted of six models on three chassis, has been reduced to two models on a single chassis.

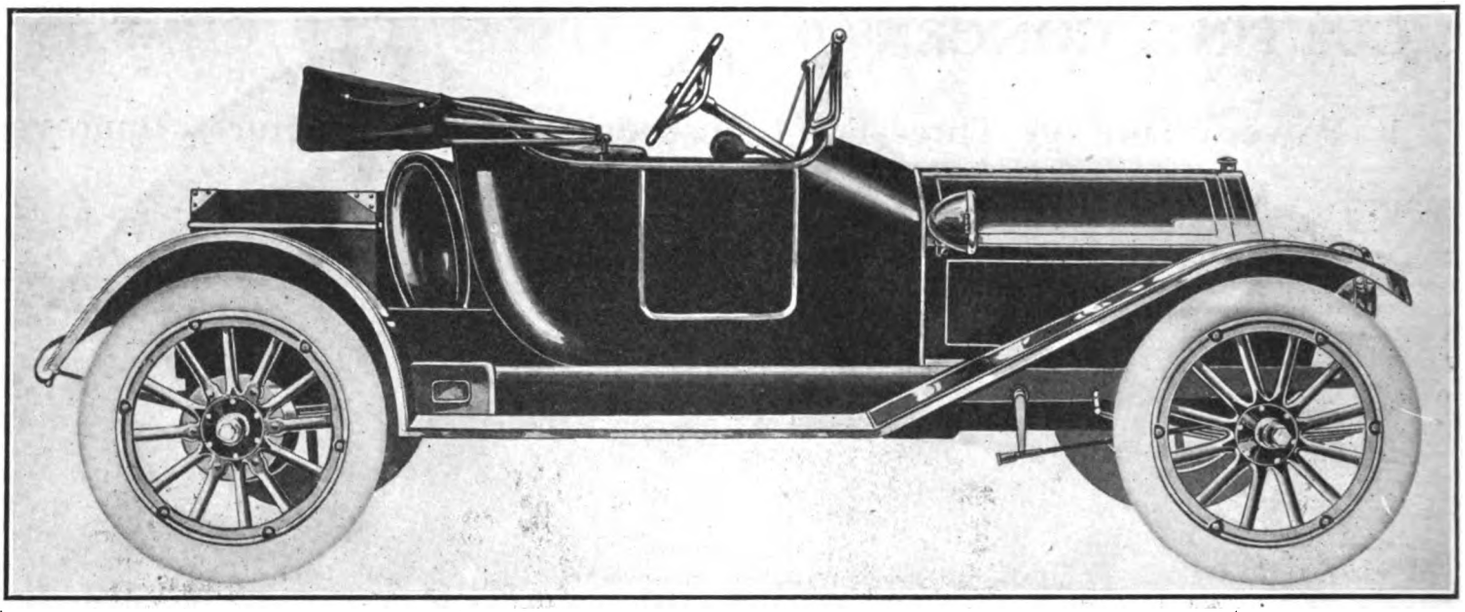
The chassis has a four-cylinder motor, rated at 40 horsepower and mounts a two-passenger roadster body of the approved type, with deep skuttle dash, oval tank behind the seat and a large carrying compartment in the extreme rear, and a five-passenger touring body. The wheelbase is 120 inches. The two models are known as the A-40 roadster and the B-40 touring car.



The chassis includes many of the mechanical features of the 1912 machines. There is this important difference, however; the motor and gearcase now are united in a unit power plant, and three-point suspension has been adopted. Another change of some importance consists in the use of a greater number of plates in the multiple disk clutch; last year's clutch had seven plates, while the number now is 15. The plates run in a bath of oil circulated through the clutch from the gearcase.

The motor is of the L-head type, all the valves being on the same side and actuated by eight cams on a single camshaft. The cylinders are cast en bloc, and have a bore of 4 inches and a 5-inch stroke.

Lubrication of the motor always has been a strong point in the Cutting, and no reason has been discovered for making any change of moment in the new model in this respect. Splash is tabooed entirely. Instead, there is an oil reservoir cast under the crankcase, communicating with the case by means of a drain opening covered with fine gauze. From this reservoir oil is drawn by a gear pump, located on the outside of the lower part of the crankcase and driven by spiral gears from the camshaft, and is forced through a duct formed in the metal of the crankcase to three smaller ducts, one leading through each of the webs in which the main bearings of the crankshaft are carried. The crankshaft is drilled out to carry the oil to the crankpins, and the surplus, forced out of the bearings, is thrown on the cylinder walls, the cams, camshaft bearings and all other interior parts.



The gearset provides for three forward speeds, selectively controlled, and the gear shafts are mounted on annular ball bearings throughout.

A feature of the frame construction that

NEW CUTTING MODEL A40—A 40-HORSEPOWER ROADSTER REVEALING SYMMETRY OF OUTLINE AND CLEAN DESIGN

indicates an intimate knowledge on the part of the Cutting designers of the exigencies of repair work, overhauling and replacements, is that the cross frame to which the torsion tube is anchored is not riveted to the main frame members, but is bolted, and can be removed. By removing the pivot pins, dropping the torsion tube and removing the frame bolts, the cross frame can be moved to the rear four inches, permitting the gearset to be removed by taking out the cap screws by which it is secured to the crankcase casting, obviously a noteworthy feature.

The rear axle, which is of the semi-floating type, is mounted on Hyatt roller bearings, and the casing is held in alignment by rods anchored near the front end of the torque tube and forming a triangle. The front springs are semi-elliptics 40 inches long and the rear springs scroll three-quarter elliptics 48 inches long.

CUTTING CHASSIS SHOWING BRAKE EQUALIZING SYSTEM

Wood wheels of the orthodox artillery type are employed, being built of second growth hickory; all spokes are 1¾ inches in diameter. The tires are 36 x 4. The brakes, of the internal expanding and external contracting types, are equalized through two sets of levers of light but very strong truss construction, giving great leverage and easy control of the car whether the emergency lever or the service pedal is used. The equalizing system for the foot brake is carried just above the fork of the torque tube, and the emergency brake equalizers under the fork. Worm and gear steering mechanism is fitted; the hand wheel, which is 18 inches in diameter, is of black walnut, with the spark and throttle levers on top. The rim is notched to afford a good grip.

The complete car has the low-hung, compact, clean appearance that is so much desired by those who are particular in the matter of appearance. The running-boards are clear, and neatness in appearanec is enhanced by placing the gear shifting and brake levers inside the body, on the right side. Black and nickel finishes are used.

In addition to being fully abreast of the times in mechanical construction, the Cutting cars are well taken care of in the matter of equipment; in all models the outfits are well worthy of the well-worn adjective "full." Top with side curtains, top boots, windshield, tire holders, an extra demountable rim, complete set of oil and acetylene lamps, acetylene gas tank, robe and foot rails, tools, jack, pump and tire outfit are provided. In addition, all models are fitted with motor starters and with electric lamp lighters operated from the dash.

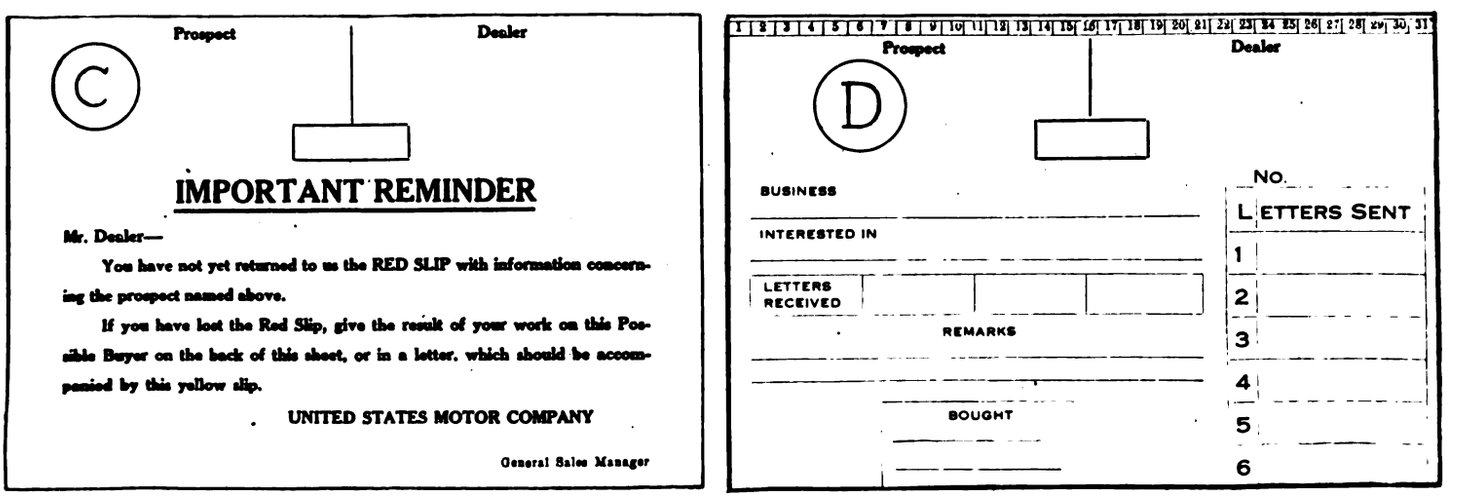
ASSISTING THE DEALER TO MAKE SALES



Far-Reaching System Employed by Big Corporation That Follows Prospective Purchasers to the End—Details Carefully Worked Out and Constitute Comprehensive Course in Salesmanship.

When a certain man whose name now is well known all over the United States, first entered the hardware business on a large scale with an immense central factory supplying branch houses in every large city and agents in every cluster of domiciles that was large enough to be styled a town, he learned, among other things, that everything does not always come to him who only waits, despite Disraeli's learned words to that effect. He found, as so many others have found since, that it was necessary for him to work while he waited, and he found that the best way he could work was to make his branch managers and his agents and dealers work. He found, too, that though many of his dealers were willing and anxious to work they did not know how to go about it intelligently.

So he "got after" his dealers and his agents—not in the nagging, pounding way that breeds discontent and antagonism, but in the quiet, helpful way that makes friends and, incidentally, makes sales. He extended a helping hand to those who were stranded on the shoals and led them over the difficult places by educating them and by the judicious use of gentle persuasion. And his greatest help was in the form of a helpful follow-up system. It was a follow-up system of the right sort. Letters which contained such gems of thought as "Why haven't you closed the contract with Smith?" found no place in it. Instead, the letters were short but cordial and answered questions rather than asked them. They were boosting letters that contained no "knocks." The hardwareman's modus operandi was to demonstrate how sales could be made and not to ask why they were not made. His business flourished and grew under the then unique plan until at present it is a veritable monument to his business acumen. He led his dealers and his agents; he did not drive them. He continually helped them to make sales; he furnished them with "leads" and sales propaganda; and he did not drop a prospect immediately he had turned over the prospect's name to a dealer for attention. He

CARD SYSTEM SUPPLIED TO DEALERS BY U. S. MOTOR CO.

It Is Employed in Connection With the Blank Forms Contained in the Accompanying Article, the Following Reproductions Constituting What May Be Termed Daily Lessons in Salesmanship.

HOW TO USE THIS CARD SYSTEM.

This card system is designed to serve the convenience of our dealers and their salesmen. When you obtain the name of a Possible Buyer—from the pink slips sent you by the General Sales Department at the Home Office, or through newspaper advertising, or in consequence of the recommendation of friends and customers—always make out a Daily Sales Record Card.

When an appointment is made for a later interview, enter the date of the "next appointment" in its proper place; then file the card under the date of the appointment. Do this always, and make it a rule to go over your daily file the first thing each morning. In this manner your interviews will be arranged methodically; you will be on hand at the appointed time, and the records noted on the card will have made you familiar with the details of the customer's case. This is very important.

When a sale is made, the date, the name and model of car, the motor number and registration number should be noted on the back of the card. The remainder of the card serves as a memorandum, as shown on the sample card which will be found in this box. By filing the card under the alphabetical index you retain a permanent and complete record of all the details accompanying the sale of the car, to which you can refer when occasion arises.

On the close of, say, the first day of the month, date card One should be moved behind card Thirty-one, and the procedure should be followed with each day's card, so that the business of any particular day will always be found in front of you.

More cards will be furnished, free of charge, upon application to the General Sales Department.

UNITED STATES MOTOR COMPANY
3 West 61st Street New York City

(1) HOW TO APPROACH A CUSTOMER

While there is no general rule which may be set up for the treatment of the possible buyer, one way which never fails is to see in him a seeker after information, and to be absolutely at his service in giving it with the utmost freedom and willingness. If the customer is a man of your own town and as yet unfamiliar with the various competing models which the market affords, it is generally a good plan not to go too far in making importunities for an immediate order; instead, offer him every chance for further information and for a demonstration. When this demonstration has been given, however, the prospect must be assumed to be able to say whether he will buy or not. But, whether you speak to the prospect or write to him, always say something about the car and its good qualities.

(2) BE CONFIDENT

Without confidence you cannot do business. If you believe what you say—and you should, or you should not say it—you will have no difficulty in making other people believe it. A plain true statement of the facts and the merits of the subject under consideration is all that is necessary. Keep positively in mind the fact that you must not decry, belittle or speak ill of your neighbors. You weaken your own case by referring to your competitors. Bestow your politeness and attention equally to all who come to your showroom and ask for information. The old-fashioned saying, that clothes make the man may be all right for the seller, but it does not hold good in the case of the customer. The jingle of the buyer's coin sounds just as musical in the pockets of a pair of corduroy trousers as it does in the most expensive broadcloth, and there is no difference in its value once it has been transferred into your own cash-box. So never judge a man by his clothes. You are apt to make a mistake.

(3) TEN REASONS WHY

The strongest of all sales arguments is the "Reason Why" argument. Therefore you should make it a point to have at the tip of your tongue at least ten good reasons why the car you sell is better than any other. Familiarity with the company's trade literature will furnish the necessary material. While the salesman occasionally says too much, it is impossible for him to know too much about his own car. "It's a fine car—nothing better. We have sold forty-nine so far this season, and have not had a single complaint!" This is a truthful, but negative statement, capable of considerable improvement in the light of good salesmanship. It would be much better to call attention to mechanical advantages and to the satisfaction the car has given to every user. It is the positive statement and the impression of the customer that the salesman knows what he is talking about that clinch the argument.

(4) LEAVE CARD AND MAIL CATALOG

When you visit a prospect, be sure to leave a card—sometimes it is the only thing by which the prospect remembers you or the name of the car. Many salesmen do not leave a catalog, explaining that they need it for another call. Instead they mail a catalog from the office, at the same time writing a letter in which they drive home the arguments which seemed to impress the customer most during the conversation.

Never fail to keep an appointment, or to see a prospect again after a few days, even if he should not be quite ready to give his order.

(5) TILLED GROUND THE BEST

Should you be inclined to hesitate about seeing a man just because you learn that a representative of some other make of car has already been to interview the prospect, then remember that tilled ground is the best. An intending buyer who has been approached usually has already convinced himself of the general utility of the automobile, so that all you have to do is to convince him that your car is the logical one for him to buy. The more the prospect knows about automobiles, the better it will be for you, besides which there is the greatest fascination for every good salesman: a contest with your rival and an opportunity to let the best man win.

(6) MAKE YOUR TALK TELL SOMETHING

Some of the older automobile salesmen will have made the discovery that it is no longer possible to dismiss the customer's inquiry with mere trivialities, such as: "This car has all others beaten to a frazzle." "Nothing like it was ever made," etc. Meaningless generalities of this sort often render the decision of the intending purchaser needlessly difficult and slow, and not infrequently impress the customer with a suspicion of inferiority of a really meritorious product.

(7) CONSIDER HUMAN INTEREST

A salesman in the country can often take his cue from the general surroundings of the prospect's house. If the house is architecturally fancy he may assume that the man wants speed and a fancy demonstration. On the other hand, if the house is simple and the surroundings in keeping, the man will want medium speed and a motor that can be throttled down. It is well to consider human interest; by doing so you will not only win a customer, but a friend for your car as well.

(8) STUDY UP

It is a good idea for the salesman to polish up his arguments once in awhile. If he travels in the same rut all the time, uses the same shopworn arguments in approaching the prospective buyer; if he does not overhaul his selling ammunition from time to time he will see his business falling off. Even clever arguments will become worn at the edges, and fresh magnetism, new enthusiasm, is needed to make the salesman continuously efficient.

(9) TO GET BUSINESS

To do a good business, you must have initiative, system, originality. You cannot sit down and wait for trade to come into your store. You must go after it. You must make personal calls, write personal letters, do everything your ingenuity can suggest, to stir up interest in your business. You must carefully attend to the wants of your customers. You must be accommodating and prompt; only in that way can you secure and hold the good will of your patrons.

(10) COURTESY AS AN ASSET

So absolutely do some people rely on the first impression of strangers, that it behooves us to try always to appear at our best. Be as natural and unaffected as possible. Study the needs and wants of your customers. Be prepared to render any little assistance to those in need of it, and, above all things, remember that you cannot catch flies with vinegar. If you cannot do anything else to help things along—just smile. Civility costs nothing and if your liver be in good working order, why should you not be courteous, civil and pleasant, and make the buyer think that you have not a care on earth? Cultivate your memory. Learn to call people by name. You have no idea what help it will be.

(11) IMPORTANCE OF THE FOLLOW-UP

Fewer things are of greater importance to the automobile dealer than a proper method of "following up" his prospective buyers. The card system is indispensable for this purpose.

When the name of an interested party comes to the office, either from the home office at New York, through your own newspaper advertising, through the recommendation of friends and customers, or in any other way, the date of the inquiry, name, occupation, business and residence address, telephone number, source of inquiry, and model in which the prospect is interested, are written on one of these cards. In that way forgetting never happens.

Keep visiting, writing, or sending literature, until the prospect places his order with you or you become satisfied that he will not, or cannot buy.

(12) KNOW YOUR CAR

The automobile salesman who wants to succeed with the present-day buyer should be well fortified with a thorough knowledge of his car and also be well posted on the important features of other cars, in order to be able to give satisfactory explanations. A close study of the trade literature issued by the Company will result in a more detailed knowledge of the various constructions.

(13) DANGER OF TECHNICALITIES

Avoid technicalities in your conversation with the customer, unless you know they are welcome, understood and appreciated.

If you think that a special letter from the home office might help matters, write to the general sales-manager for such aid, giving him the particular points to be covered.

(14) SPECIALIZE IN YOUR ARGUMENTS

Specialize in presenting your arguments. Show the physician that by the use of the car he can visit all his patients in one-third of the time, or three times the number of patients in the same time—and that thereby he increases his usefulness to the community as well as his income. Illustrate to the business man that the car will save him money; to the contractor that he can more successfully oversee his operations. In other words, talk to the prospective buyer about his own case and hand him such literature as will best explain what the motor car will do in serving his particular needs.

(15) YOU MUST ADVERTISE

One of the things often overlooked is the value of advertising. The business life of the present day is complex and the dealer who wants to sell a great number of cars must bring the fact that he is selling them and that his cars are the best the prospect can buy, to the attention of the greatest possible number of buyers. Judicious publicity is as great a help to the success of the individual dealer as are reasonable price and excellent value of the car he sells. It will never prove a good plan to expect good business first and then decide upon a campaign of advertising. A dealer who lets others know early in the season that he is alive and where his goods can be found by those who are likely to need them, gets the biggest business, can advertise still more, and do still more business. If you are not already familiar with the company's new advertising plan, write to the Advertising Department for a copy of it. It will be of much interest to you because the new plan makes you virtually your own advertising manager. Any dealer who can sell a car can write an advertisement that can sell a car—by just anticipating the questions and objections the average customer advances; by refuting the false sayings of his rivals; by setting forth in language such as he uses in his every-day talk, the points of superiority of the product of the United States Motor Company.

(16) USE THE MAILS

Have you ever considered the value of a forceful personal letter to your prospective customer? The mail will reach your man when it is impossible for you to gain an interview. You can increase your business manifold through letters and it costs practically nothing but a two-cent stamp. Plant your literature where it will do the most good; that is in the hands of the man who needs the automobile. If you are too busy to institute an effective mail circularization, let us help you. Through a letter you can speak to a hundred men in the time it would take you to see only one personally. Try it.

ASSISTING THE DEALER TO MAKE SALES.

(Continued from page 23.)

followed him up with personal letters—not form letters that usually are thrown away or which breed contempt—and what is most important of all, he kept his dealer informed regarding the correspondence by forwarding to him a copy of every letter he addressed to the prospect.

It is just such a system as this that the United States Motor Co. of New York has installed. It is a cross between an educational campaign and a boost for sales, and the idea behind it all is helpful suggestion and not harmful harping. The system was evolved to help the dealers. Its purpose is to show them how to make sales, how to approach a prospect, just what to say and just what not to say in order to make the best impression and to make the sale. That it does help the dealers is revealed by the fact that as the result of an advertising campaign one car was sold for every eight inquiries originating in the State of New York that reached the home office of the United States Motor Co. in the month of August. The high average is attributed to the working of the follow-up system.

Of course, it costs a lot of money to install and operate such a system; but it is worth it. Every cent that is spent goes to help the dealers to make sales. It is a "show me" system of the first water, and the least that can be said of it is that it works. With such a big institution as the United States Motor Co. and with a line of cars embracing the Maxwell, the Stoddard-Dayton and the Columbia, requiring representation in practically every city and hamlet in the United States, it is inevitable that there should be among the dealers a number who are enthusiastic salesmen but who are lacking in tact, or intuition, or training—call it what you will—and it was to help these men that the system was installed. Even among the most successful salesmen with the best records, cases not infrequently crop up with which they are unable to cope. In these cases, a personal letter from the home office, signed by J. D. Maxwell himself, or by Alfred Reeves, the sales manager, often provides the necessary stimulus to the prospect that results in the sale. This is part of the system.

Not the least important feature of the whole system is that it is simple. Red tape, so-called, has been cut off so short that scarcely a vestige of the color remains. In the first place, every dealer, when he becomes the company's representative, is supplied gratis with a card index system, with its tabs marked according to the letters of the alphabet. One of the cards that is to be filed with the aid of these indexes is reproduced herewith, the obverse and reverse sides being marked F and G, respectively, for purposes of explanation.

Apparently, nothing that will prove of benefit to the dealer in the way of helpful suggestion has been overlooked. The available space on the yellow cards is used in a manner that cannot fail to help the dealer. On every card there is a particularly terse suggestion dealing with an individual phase of the salesman's art. For the most part, these suggestions are short and crisp and their value, which cannot be doubted, is due to the fact that they pro-

Dear Sir:

We received from you recently an inquiry for catalog and information with reference to Stoddard Dayton automobiles.

In order to avoid annoyance to you, in case you have already decided upon your purchase — or to insure that you receive further information on Stoddard Dayton cars, should you desire it—we are taking the liberty of requesting you to fill in the attached postal. By giving us this information you will confer a favor for which we thank you in advance.

Hoping that we have not presumed too much on your good nature in this request, we remain

Yours very truly,

DAYTON MOTOR CAR COMPANY

Form 331C—10M—9-27-11

REPLY POST-CARD SENT OUT BETWEEN FIRST AND SECOND FOLLOW-UP LETTERS

ASSISTING THE DEALER TO MAKE SALES.

(Continued from page 24.)

(17) HAVE IT WRITTEN DOWN

Look out for the employee who carries your business in his head. If he goes away he takes that head with him and his successor is at sea, and so are you. If he dies, ditto. Every clerk, department manager, or other employee of your establishment should be required to set things down in black and white. All data pertaining to customers, territory, stock and equipment should be on record, properly classified and filed. Such system makes it possible for you to dispense with the services of the best employee at any time, without throwing your whole business out of joint. Do not allow any one head to monopolize all the information about your business. Have it written down.

(18) KEEP COMPLETE RECORDS

If this card system is properly maintained, every letter or call will be a progressive step. It does not take over two minutes to write up a record.

When a sale is made, the license and car number should be written on a card, which makes it a complete and useful record. It also helps to avoid misunderstandings in the many details that usually accompany an automobile sale. If the prospect finally says: "Not until next Spring," the card is filed away and the salesman is certain that the customer will not be forgotten.

(19) HOW TO DEMONSTRATE

The most essential qualification in the make-up of an automobile demonstrator is the aptness with which he seizes his opportunities. He makes his appointments with tact and carefully avoids the exhibition of undue anxiety. If possible, he chooses agreeable weather for his demonstration, and in case of rain or cold provides wraps and coverings before starting on the trip. Then no excuses are necessary. The car should be kept scrupulously clean, and car and demonstrator should show an atmosphere of comfort that impresses the customer favorably. Make it a rule to let the prospect take the wheel of the car, so he may convince himself of the ease with which it is managed.

(20) DON'T RACE

The ideal demonstrator does not speed his car unless he is requested to do so, and when the road is clear; and then he handles the vehicle with an unfailing precision that will indicate to the prospective buyer that the handling of an automobile is really a comparatively simple thing. Do not bewilder the novice with too many explanations at one time, for anything likely to confuse him is worse than no explanation at all. Special talking points should be enlarged upon and made to show their value in an actual demonstration. Altogether it is safe to say that the demonstrator makes or unmakes the sale, since the customer to whom the car is demonstrated has very nearly reached the purchasing point.

(21) SALESROOM, REPAIR SHOP AND STOCK ROOM

The salesroom should be kept as clean and attractive as possible. If possible, have a car of each model on exhibition and see that they are fully equipped. Women are an important factor in selling cars; they like the fixings, and their tastes are catered to.

The repair shop is a difficult problem. The customers must be satisfied and the shop must not show a loss. The proper solution is this: put a diplomat in charge; hire good mechanics and teach them to do the work thoroughly and economically. Avoid professional automobile repair men who are always improving on factory construction, and, above all, never under any circumstances allow repairs to go out until they have been paid for. If you cannot collect when the work is finished, forget the charge. Do not lumber up your books with charges that may be disputed later. Settle it up at the time and you and your customers will be better friends and there will be no uncollectable accounts to worry about.

In the stockroom, have everything in its place and a place for everything. Record everything coming in and going out, and keep this system up.

(22) FREE INSPECTION

The Company's Free Inspection and Satisfied Owners' Policy* is primarily intended to be of help to the dealer. Such service does not consist in giving away repair parts, but it should be exercised in an examination of the owner's car and in the making of the small and inexpensive adjustments that occasionally become necessary on carburetters, magnetos, etc. You will make friends for yourself and your business if you do not wait until the owner comes to your garage with a request for an examination, but if you offer to look over the car and ask whether anything might be wrong. Your interest in the welfare of your customers will be amply repaid; they will speak of it to friends, who, when they are themselves ready to buy, will flock to you rather than to your competitors.

* If you are not already familiar with it, write for a copy.

(23) KEEP A STOCK

It is a wise dealer who keeps a stock of cars on hand for immediate delivery. Many a sale has come to naught simply because the dealer did not have a car to deliver at the time the customer wanted it. Procrastination is the thief of time as well as of automobile sales, and the dealer who greets his customer with: "Here's your car," surely gets away with a bigger sales record than his neighbor who is merely willing "to book" his customers' orders for more or less prompt delivery.

(24) THE FATE OF THE PRICE-CUTTER

Please bear in mind that the automobile business is not different from any other line when the dealer attempts to sell at cut-throat prices. When your competitor chooses to give his profit away, let him do it, for his price-cutting is absolute proof that he is up against it good and hard. Slashing prices helps no automobile dealer; it is merely the forerunner of a debt and mortgage. Do not be bluffed into selling your goods at what Mr. So-and-So sells his. Price-cutting is possible only to the man who does not know the worth of his own goods. Sooner or later—generally sooner—after he has tried in vain to reconcile his bank account to his liabilities—the price-cutter makes his inglorious exit from the business.

(25) SPECIAL EQUIPMENT CAUSES DELAY

Here is another tip. Many delays could be obviated if all dealers would avoid asking the factories for special equipment. Of course there are circumstances where the customer insists upon such equipment and where he should have it. But in the general run of business every request for equipment that differs from the standard specifications interferes with factory routine and causes delays which in the end reflect in the filling of ALL orders.

The equipment with which the cars of the United States Motor Company are furnished has been decided upon as the best indicated by exhaustive investigations and tests.

(26) LIST OF OWNERS

Keep a complete list of the owners of the cars you sell in your territory, and wherever possible refer to it in making sales. Your statement that Mr. Jones and Mr. Smith bought the same car carries a lot of weight with the prospective buyer. He logically argues that a car is certain to do for him what it has done for other owners. Besides, as time goes on, your owners will provide a good market for the sale of newer models, for a man who has operated one make of car is very apt to buy a later model of the same make with which he has been well satisfied.

(27) MARKING YOUR LITERATURE

Never send a catalog without turning down the leaves or otherwise marking the page showing the model desired, and with a blue pencil underscore certain features that will carry weight with the prospect. Also mark in other places of the catalog any matter or special arguments that may come up. Write on the envelope or wrapper: "Marked Copy." Put your card into the catalog, since individuality is the most valuable factor for the salesman and for the firm he is serving.

(28) CAUTION IN TRADING SECOND-HANDS

When you sell a car, at the same time taking in trade an old one, you are confronted with the problem of selling two cars. There are conditions under which a trading-in of old cars, to facilitate the sale of new ones, becomes expedient. On the whole, however, it is well to bear in mind that the task of a salesman is not merely to sell cars, but to sell them at a profit. Unless you establish a limit you may find yourself overstocked with second-hand cars and your capital tied up in old material at a time when it would be more profitably invested in new goods. Not unfrequently it is the better part of wisdom to say "No," and to forego a sales opportunity rather than make a sale of doubtful profit. Here is where it is advisable to go slow and to use good judgment.

(29) THE COMPANY BEHIND THE PRODUCT

One of the most forceful ways in which the purchaser may be brought to an appreciation of the cars you sell is in calling his attention to the commanding position which the company occupies in the industry. The financial integrity and commercial responsibility of the United States Motor Company make it certain that all its products are made with highest regard to giving full value, and that the prospect is dealing with a concern whose reputation is world-wide and whose product is in the hands of many thousands of satisfied users.

(30) THE SPECTRE OF REPAIR BILLS

All cars made by the United States Motor Company are the result of the highest class of engineering skill to be found in the industry. All parts used in building these cars are of the material best suited for the particular properties it is desired to secure, and beyond a reasonable and natural wear of bearing surfaces and tires no repairs will become necessary that can be attributed to material or workmanship.

This is an important thing to keep before your customers, many of whom still labor under the notion that the owning of an automobile is a matter of great expense and considerable trouble. You know it is not.

(31) AUTOMOBILE VS. HORSE

The operation of an automobile is no more beset with difficulties than the acquirement of expert horse knowledge, comprising at least a tolerable smattering of horse-shoeing, harness-making, wagon-building, and of veterinary accomplishments.

In computing the usefulness of the automobile and of the horse separately, a different reckoning will have to be adopted for each. It is evident that the cost of the horse is based on the time it is kept—irrespective of the amount of service rendered, while the automobile costs a given sum for a given amount of work done, causing no expense whatever during periods of non-use.

ASSISTING THE DEALER TO MAKE SALES.

(Continued from page 25.)

plain by watching its workings. Let it be assumed, for instance, that John Doe, of Texarkana, Tex., reads a Maxwell advertisement in one of the trade papers, or in a daily newspaper, or on a fence, and thereby is prompted to write to the home office for a catalog. When his inquiry is received, it is assigned to the Texarkana dealer, and John Doe's name and address and the date are noted on three slips, illustrated herewith as A, B and C, and a card, designated D. All four are made out simultaneously with the aid of carbon paper, by a corps of young women, each one of whom looks after a certain section of the country.

Slips A and B, the former being pink and the latter bright red, then are forwarded to the dealer, together with the original inquiry, a copy of which is kept on file in the home office. The reason for sending the original inquiry to the dealer is to furnish him with a card of introduction to the prospect. In the mean time, as is made plain on slip A, the home office has forwarded to the prospect the particular catalog or information that he requested. On the pink slip A the dealer is instructed to see the prospect and to make report to the home office on slip B within a period of 15 days if the dealer's territory lies in the East or Middle West, or 30 days if the territory is on the Pacific Coast.

When the dealer reecives slips A and B from the home office, his first duty is to copy the particulars as given on to the obverse side (F) of the card which accompanies the filing system supplied the dealer. The card is self-explanatory. It is filed in the card system under the date of the month for which an appointment has been made. Then each day the sales manager, or whoever has the business in charge, places the day's cards, after the various appointments have been assigned to salesmen, at the back of the pack, behind the card lettered 31. In this way the day's business always is before the dealer, who can tell at a glance just who he has to see and at what hour he must call. If, after several calls have been made on the prospect a sale results, that fact is noted on the reverse side of the card (G), which then becomes a permanent record of the sale and is filed alphabetically in the blue index.

The card D, which, as has been explained, is made out simultaneously with A, B and C, is filed at the home office. The figures at the top (1 to 31) serve to designate when the dealer's report on the red slip B is due. If John Doe proves merely a catalog hunter and has no real intention of purchasing a car, the dealer has little difficulty in ascertaining that fact, which he notes on the red slip B and transmits to the home office file as a "dead one" and the expense of again circularizing the prospect is saved.

If the dealer has been so busy, or so neglectful, that he has failed to send in his report on slip B within the 15 or 30 days requested by the company he then receives slip C, which is printed on bright yellow paper to make it conspicuous. If that fails to bring in the red slip B, a personal letter signed by Sales Manager Reeves is despatched calling attention to the delinquency and requesting a prompt reply. The latter expedient seldom fails to bring a response.

The necessity for the company receiving a report telling whether the prospect is a good one or a "dead" one will be appreciated when it is pointed out that each prospect is systematically followed up from the home office, provided the likelihood of his purchasing a car appears good. To send literature continually to a prospect who really is a "dead one" represents an unnecessary expense which it is the purpose of the red slip to obviate.

If, in the estimation of the dealer, John Doe is a good prospect with bona fide intentions of becoming the owner of a car in the near or the far-distant future, he reports to the home office accordingly and the machinery of the follow-up system is set in motion to help the dealer make the sale. Immediately, the home office receives notification that the prospect really is a prospect, the card D is filed by State and County and Dealer. When the first of the follow-up letters is sent out by the home office to the prospect the date of the letter is entered on the card in the place reserved for it. Other places are reserved for the date and filing index number of letters that are received in reply, and a copy of every reply invariably is forwarded to the dealer in order that he may be constantly apprised of the situation which obtains.

Before the second of the series of six follow-up letters is sent to the prospect, however, a reply postcard, reproduced herewith, is sent him. Then, if he has purchased a car in the mean time, or if he has decided not to buy a car, the follow-up letters are stopped, as is the expense of sending them out. If he has not purchased a car and still intends to do so, the second of the series of letters is sent to him after a suitable period of time has elapsed.

In the meantime, if the prospect appears diffident, or the dealer has difficulty in closing the deal, or the prospect wants specific information on a particular point, a personal letter signed by either J. D. Maxwell or Alfred Reeves will be sent from the home office at the dealer's request. This feature alone constitutes one of the most valuable of the whole system, for the personal appeal direct to the prospect from the head of the big company almost invariably so alters the situation as to make it comparatively easy for the dealer to book the order.

Another excellent feature of the system, and one which was incorporated solely to help the dealer, lies in the maintenance of what may be styled a "publicity censorship board." Suppose, for instance, that the dealer desires to place some advertising in a local paper but is an indifferent "copy" writer. He may either have his "copy" written for him at the home office, without obligation or expense for cuts or electrotypes, or he may get out the "copy" himself and forward it to the home office to be edited. If, in the estimation of the advertising experts retained by the home office, the "copy" is good, the dealer is apprised accordingly. But if, as so often happens, the "copy" is calculated to repel rather than to attract, the dealer has pointed out to him the error of his ways, and helpful suggestions, based on the company's almost unlimited experience, are offered and in the end the local paper in which the advertising appears is enhanced in appearance by well-placed cuts and intelligent text matter of such character as to attract the attention of possible purchasers. All this service is free to the dealer and is maintained to help build up his business.

Another angle of the system which assists in cutting down the expense of the follow-up system and at the same time engenders a friendly feeling in the purchaser of a car lies in a little card which is sent out with every car. The card (E) is reproduced herewith and is self-explanatory. It is enclosed in an envelope, addressed, and merely requires to be filled out and mailed to the factory, which thus obtains a full record of car owners. By reason of the fact that its despatch ensures the receipt by the owner of "something for nothing," it invariably is returned and in this way a check is placed on the sending of literature and letters to those who already have purchased. Incidentally, the sale of cars by dealers is checked and the returned cards form a permanent record, filed in the home office, of the whereabouts of every car that is sold. By sending out the instruction and parts book in response to the request on the card, the company at least partly ensures that its products will be properly cared for, and this, in turn, reflects back to the credit of the dealer, for satisfied purchasers are the best advertisement, and one word of mouth from a satisfied owner is worth pages and pages of perfectly good advertising copy. And it is a great deal less costly to the company and to the dealer.

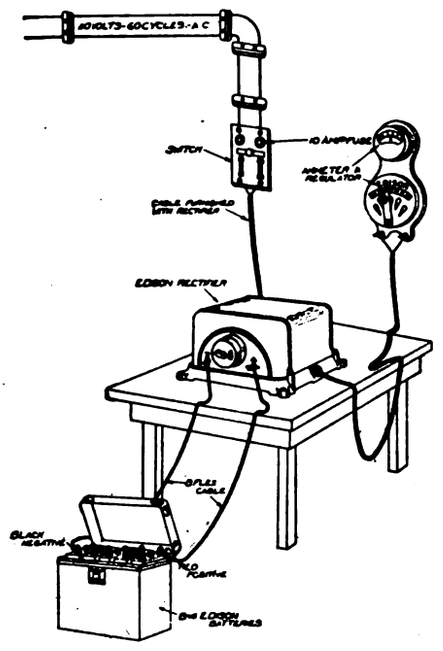
SIMPLE ELECTRIC VALVE IN NEW EDISON DEVICE



It Is an Alternating Current Rectifier of Surprising Simplicity—Intended for Battery Charging Purposes.

Although charging storage batteries from a source of direct current is a comparatively simple operation, requiring not more than a couple of electric light bulbs and a few feet of wire, the same operation where the source of current is alternating is more difficult and entails the use of special apparatus which may or may not be complicated, according to the theory upon which it is constructed and on which it operates. In seeking to eliminate the objections to the mercury arc type rectifier, apparent in the fragile bulb, and to the rotary rectifier with its many moving parts and the necessity for almost constant attention, Thomas A. Edison, Inc., of Orange, N. J., just has brought out a new type of alternating current rectifier which is simplicity itself in both construction and operation. Like all other Edison devices, the new rectifier has not been offered on the market until its right to the prestige of Edison's name had been proven beyond cavil; it has been under experiment for a period of several years, and at last has been brought to the state of perfection where some 4,000 hours' continuous operation at full load has failed to make necessary adjustments of any kind.

In its simplest aspect, the new rectifier is merely a mechanical valve which permits current waves of only one polarity to pass through it to the battery. It is of the electro-mechanical or vibrator type, and in contradistinction to the familiar mercury arc rectifier, commences operation immediately the current is turned on and without preliminary attention of any kind. As a matter of fact, the device should never require attention once it has been started, for it is perfectly automatic in action and its moving parts are so few and so well protected that it is almost a physical impossibility for its mechanism to become deranged.

The complete apparatus consists of the rectifier, which is supplied in several sizes to operate on 110-125 volts alternating current, either 25, 40 or 60 cycles, a double pole switch, a rheostat and an ammeter; sufficient wiring to connect the various components is supplied, and the operation is rendered simple by means of a wiring diagram. The direct current voltage which the device supplies may be varied from 2 to 10 volts, to suit requirements. Similarly, the amperage may be adjusted, the B2 type machine being constructed to deliver from 3 to 8 amperes, and the B4 type machine delivering from 6 to 16 amperes.

In connecting the rectifier for battery charging it is merely necessary to attach two wires from the source of electric light current to the cable furnished with the device. From two binding posts, plainly marked positive and negative, two wires are led to the battery. Where all the batteries to be charged are of the same type and capacity, adjustment of the direct current is not necessary, of course, in which case the rectifier can be set at the factory for the desired voltage and amperage and

EDISON'S NEW A. C. RECTIFIER

will require no further attention. Where several types and sizes of batteries are to be charged, the equipment must of necessity include a rheostat. Although the new device is at present supplied only in sizes suitable for charging comparatively small batteries, a complete line in sizes up to 100 amperes capacity is under construction and shortly will be placed on the market. The larger sizes, of course, will be suitable for charging the batteries of electric vehicles.

Annealing to Facilitate Tube Bending.

A piece of copper or brass tubing that is to be bent may be annealed, if it is not already as soft as it should be for this purpose, by passing it slowly through a blowtorch or other flame and heating it to a dull red a little at a time until every part that is to be bent has been so heated and then allowed to cool. The flame of a common gas stove is excellent for annealing small tubing in this way. The fact that a piece of tubing has been annealed, however, does not preclude the necessity of filling it with sand or lead to prevent kinking.

ST. LOUIS SHOW STAGED IN TRANSPLANTED FOREST

Fifty-three Dealers Show Latest Products Amid Rustic Surroundings—Electric and Commercial Vehicles Much in Evidence.

In a forest two acres in extent, which is described as dense and which sprang up on the outskirts of the city at the inspiration of a master decorator, 53 automobile dealers, members of the St. Louis Automobile Manufacturers' and Dealers' Association, opened on Monday last, 7th inst., an early fall show comprising the products of 73 motor vehicle factories, in Highland Forest Park. Weather permitting—for the better part of the show, which is the sixth annual exhibit of the association, is out of doors—the show will be open each afternoon and evening until Saturday next, 12th inst.

The decorations are effective but artistic. Clumps of growing trees entwined with shrubbery have been transplanted from nearby forests, and to the myriad colored autumn leaves and berries which go a great way toward making the surroundings eye-pleasing during the daylight hours, have been added thousands of vari-colored electric lights, which cast their glow for the benefit of the evening visitors. In perfect harmony with the surroundings, the partitions which separate the various exhibits all are of rustic formation, and rustic benches and rustic signs which designate the exhibits are profuse.

Music in plenty is supplied by two brass bands housed in bandstands of rustic formation at opposite corners of the park.

The cars on exhibition are: Borland electric, Stutz, Reo, Matheson, Stanley, Oldsmobile, Flanders, Flanders electric, Hupp-Yeats electric, Case, Ohio electric, Premier, Paige, Fiat, Haynes, Marmon, Alco, Abbott, Detroit electric, Oakland, Jackson, Michigan, Rambler, Locomobile, Mitchell, R. C. H., Buick, Firestone-Columbus, Studebaker, Henderson, Warren, Standard electric, Stearns, Speedwell, Overland, Cadillac, Nyeberg, National, Little, Glide, Peerless, Detroiter, Rayfield, Dorris, Bergdoll, Moon, Hudson, Ford, Regal, Pierce-Arrow, Moline, Empire, Maxwell, Stoddard-Dayton, Columbia, Rauch & Long electric, Packard, White, Chalmers, Baker electric, Woods electric, Waverly electric, and Velie.

The commercial vehicles shown are: Wilcox, Poss, Universal, Alco, Locomobile, Buick, Speedwell, Peerless, Dorris, Moon, Ford, Pierce-Arrow, General Vehicle, Packard, White, Brooks-Latta, Gramm, Modern, Federal, Mack, and Commerce.

GENERATING THE CURRENT THAT LIGHTS THE CAR

How the Magneto Developed Into an Illuminating Dynamo—Systems That Employ Permanent Field Magnets Compound Wound, Single Wound and Unwound—Caring for Commutators and Brushes.

(This is the third of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render earier their care and repair by dealer and owner alike.)

The simplest of all the current generating machines that may be used for electric lighting purposes, as has been outlined in the two previous articles which have appeared in the Motor World, is the permanent magnet generator, or, as it is more familiarly known, the magneto. It is around an instrument of this type that several of the successful electric lighting systems are built. Despite its inherent simplicity, however, which assuredly is one of its greatest advantages, for there is practically nothing

VESTA GENERATOR SHOWING MECHANICAL VOLTAGE REGULATOR

to get out of order or require attention, the permanent magnet machine is lacking in one of the most important properties of the dynamo type of machine in which the fields are composed of electro-magnets.

Why Current Regulation Is Necessary.

In the permanent magnet machine the magnetic field remains constant, regardless of changes in the speed of the armature; it is the same whether the machine is running or idle. From which it follows that if the speed of the armature could be maintained constant the output of the generator also would remain constant. But as every one knows, it is impossible to drive an automobile at constant speed, no matter what that speed may be. Consequently, the speed of the magneto armature varies in accordance with the speed of the vehicle, and unless some provision is made for governing the armature speed the output of the generator will vary over such wide limits as to be practically worthless for lamp lighting or battery charging purposes.

As a matter of fact, it is extremely difficult to so design any type of generator that the output will not vary within the narrow limits necessary to maintain practically constant brilliancy in the lamp filaments. This is one of the reasons a storage battery is an essential part of a lighting system. It may be likened to the rubber gas bag that generally is used between acetylene headlights and an acetylene generator. Like the rubber bag, the storage battery absorbs fluctuations of increased output caused by increased armature speed, and when the armature speed drops to the point where the lamps normally would dim, the storage battery gives up a small part of its energy just as the rubber gas bag collapses slightly when the pressure from the acetylene generator drops, thereby maintaining the pressure in the piping between the bag and the lamps constant within certain limits.

Battery "Floated on the Line."

To carry the same analogy a little further, if the acetylene generator failed through any cause to make gas, the headlamps would be supplied for a very short time by the stored up gas in the rubber bag. But it soon would become exhausted and the lamps would go out. With the storage battery and generator, however, though very nearly exactly the same phenomena may be observed, the energy stored in the battery is sufficient to maintain the lamps lighted for a considerable period, as for instance while a car is standing with the engine idle. Eventually it would become exhausted, of course, when it would be necessary to recharge it with the aid of the generator. Another reason why a storage battery is necessary in lighting systems is that many of the dynamos that furnish the initial current require a storage battery "floated on the line" before their self-regulating properties become apparent.

The Perfection battery charger, manufactured by the Economy Mfg. Co., of Economy, Pa., is an instrument of this type. It is a permanent magnet generator, or magneto, which is operated at constant speed and which relies for its self-regulating property upon the inherent characteristics of the storage battery to increase its resistance and thus to take less current from the generator as the battery approaches the fully charged condition. This is a characteristic which applies to all storage batteries and is quite easily explained.

"Storage Battery" Really a Misnomer.

During the charging or discharging operation, certain chemical changes take place in a battery. The battery does not really "store" the current; instead, it really makes the current. When it is fully discharged, the elements are exhausted (or may be said to be exhausted). When the battery is being charged, the elements are being revitalized, so to speak; they are being put into the condition that will cause them to produce an electric current. In other words, electricity, of this kind, is the result of chemical action. When the elements are exhausted there can be no chemical action and consequently there can be no electricity. When the battery is charged, fully or only partly, the plates undergo certain chamical changes which are the reverse of those that obtain when the battery is discharging. The reason for the increase in the resistance of the battery is that during the process of charging the plates absorb a certain percentage of the acid and as the water which contains the acid is a poor conductor of electricity—its conductivity is proportionate to the amount of acid it contains—the resistance of the battery rises.

Regulation by Battery Resistance.

In the Perfection battery charger advantage is taken of this characteristic to ensure that at high armature speeds the battery will not receive its charge at too high

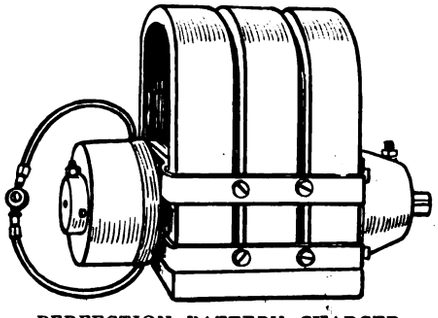
Digitized by Google

a rate. Otherwise, there is no method of voltage or current regulation, the capacity of the generator being 7½ amperes at 1,200 revolutions of the armature a minute. As the generator is designed to operate at twice engine speed it may be expected to carry the full light load of approximately 8 amperes at about 15 miles an hour on high gear.

Simplicity That Precludes Trouble.

The most striking feature of this particular instrument, of course, is its extreme simplicity. Provided it is lubricated, and even that operation is reduced to the point where it requires the minimum of exertion and attention, for the shafts run in ball bearings, there is absolutely nothing to get out of order. The likelihood of trouble has been obviated even in the case where it becomes necessary to take the instrument to pieces, for there are no insulated screws or bushings in its make-up, the insulated parts being carried on a ring which is separate and easily removable without the necessity for disturbing the other parts. Another unusual feature is that the magnets are mounted on a composition of ebony and asbestos wood which protests them from short circuits and demagnetization. The cut-out is magnetically operated and is arranged on the dash.

In view of the simplicity of the whole instrument it is probable that the only trouble which might manifest itself would be in the brushes which should be examined from time to time to ensure that they are pressing against the commutator properly. Sparking at the brushes, which is the bane of the electrical engineer's life, for it causes excessive wear and is in itself a sure indication of loss of efficienscy, may be eliminated quite easily by simply shifting the brush holder until the output reaches the required standard and sparking no longer occurs.



Color Scheme Facilitates Connecting Up.

The wiring of any electric lighting system quite naturally may prove a prolific source of trouble unless care is taken to see that (1) the proper size wire is used, and (2) the proper wires are attached to the proper binding posts. In this respect, it is becoming a fairly common practice for manufacturers to supply their systems equipped with wires insulated in different colors. Thus it becomes a simple matter for the amateur to connect the red wire, according to the diagram which accompanies the machine, to the red binding post, and so on with the other wires. Generally, a red wire is used for the positive side of the circuit, or the side which connects the positive terminal of the generator to the positive terminal of the battery. A black or a green covered wire generally is used for the negative circuit.

Two Methods of Governing Output.

When it is desired to maintain the output of a magneto generator practically constant, regardless of changes in car speed, there are two methods available. The first is to utilize some sort of slipping clutch or drive that will not permit the magneto armature speed to become greater than a predetermined limit. Generally such devices rely upon centrifugal force for operation, and though there are a number of machines of this type in successful operation, the system does not appeal, for it presupposes wear in the clutching device and loss of efficiency results.

The second method of maintaining the output constant is to arrange for the insertion of resistance in the line automatically, the resistance to be increased as the speed of the armature increases and the

PERFECTION BATTERY CHARGER

output therefore remaining practically constant. The Vesta magneto generator, manufactured by the Vesta Accumulator Co. of Chicago, Ill., is a machine of the latter type and probably is the only one of its kind which at present is in general use. The modus operandi of the generator is beautifully simple, as an examination of the accompanying sketch of the regulating mechanism will show.

Resistance Automatically Cut In.

Immediately the engine is started the magneto armature commences to rotate and when it has reached a speed of 400 revolutions a minute the centrifugal fly-ball governor connects the generator with the battery. As the speed of the armature increases the governor moves an arm across a series of contacts and in this way automatically inserts resistance in the line and thus maintains the output constant. Of course, if the engine stops, the spring-returned balls in the governor will cause the circuit between the generator and the battery to be broken and thus will prevent the battery discharging through the generator.

Although the current regulating apparatus appears complicated, it is not as complicated as it looks and really is quite simple in operation and seldom, if ever, requires attention, other than a few drops of oil about once a week. Only the moving parts should be oiled, though, needless to add, oil never should be put on the commutator or other electrical contact.

Commutators Require Occasional Care.

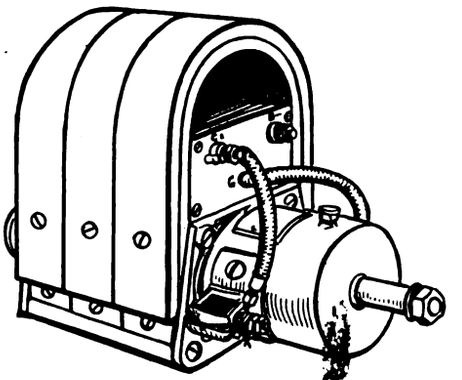
In case of failure of the generator to operate, the brushes, which generally are the most prolific source of trouble in any generator, should be examined to see that they make proper contact and have not worn down too far. It occasionally happens that the brushes of a generator will become so worn as to let the brush holders come in contact with the frame and thus prevent the brushes from making proper contact. If the current output of the machine shows signs of falling off, the commutator should be examined and if it exhibits a scratched or pitted appearance, and is not bright, very fine sandpaper, about No. 00, should be held against it while the machine is running. The sandpaper should be applied very lightly, however, and should not be permitted to remain in contact with the commutator longer than is necessary to remove the foreign matter. Medium oil should be used in the bearings, preferably, as there then will be less tendency for it to work out and accumulate on the commutator. One of the important considerations which should not be lost sight of is that in installing any permanent magnet machine it should not be fastened down upon an iron or steel base but should be supported on brass or aluminum.

Wrong Connections and Their Results.

Too much stress scarcely can be laid upon the necessity for making doubly certain that in connecting any generator the positive side of the battery is connected to the positive and not to the negative side of the machine. If the positive wire from the machine is connected to the negative side of the battery the result will be that instead of charging the battery, the machine will discharge it, and if the condition is not remedied within a very short space of time the battery probably will be ruined. With the Vesta generator it is a simple matter to determine which side is positive and which side is negative; by reason of the factory connections, if the machine is run clock-wise the right side will be the positive side; if it is run anti-clock-wise, the left side will be the positive. From which it appears that the instrument may be operated in either direction without altering wiring connections and with equal efficiency, which fact is true of any permanent magnet machine. Though dynamos may be operated in either direction, they will not generate in the opposite direction

Digitized by Google

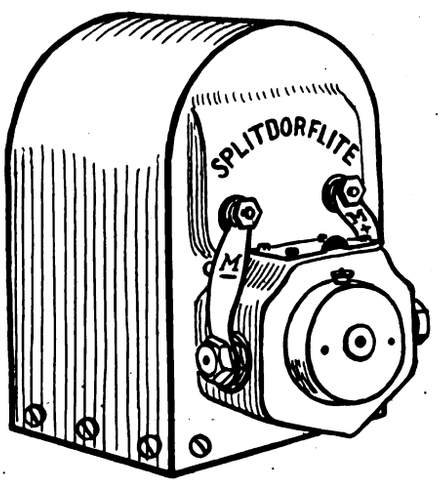
to which they are supposed to run unless either the field or armature connections are reversed.



Meter Indications of Reversed Wires.

If with the Vesta system the wires leading to the battery are reversed, with the positive generator wire leading to the negative battery terminal, and provided all other connections are correct, the ammeter will indicatea "charge" when the engine is running as well as when the lamps are lighted, thus serving as indication of improper wiring. Whenever the generator cuts in the ammeter needle generally will move rapidly over to 10 instead of building up slowly, as it would if the connections were properly made. In a case like this, though the ammeter reads "charge," the battery actually is being discharged. Similarly, when the wires leading to the ammeter are reversed, with the other connections properly made, the meter will indicate, presumably, the rate of charge when it really should be indicating "discharge." When the engine is running the meter will indicate "discharge" instead of "charge." as it should if the connections are correct. When the wires leading to the generator are reversed, the meter will at all times indicatea "discharge," which is the true state of affairs, regardless of whether the engine is running or not or whether the lamps are burning or not. There really is little excuse for the wiring to be connected improperly, however, for the Vesta company supplies a comprehensive wiring diagram in colors to correspond to the colors of the wires supplied with the system.

Field Windings on Permanent Magnets.



In the Berden system of electric lighting, manufactured by the Esserline Co. of Lafayette, Ind., the idea behind the permanent magnet machine has been carried a little further by the addition of a supplementary compound wound electro-magnetic field, the purpose of which is to make the instrument self-regulating without the necessity for slipping clutches or other mechanical means. The permanent magnet field serves to induce the initial current and, incidentally, positively assures that the output will "build up" properly after the machine has been taken down and put together again. Another important end it serves is that it absolutely prevents the polarity of the generator changing as it would in an ordinary dynamo if the wires from the battery were connected wrongly. If the polarity were changed inadvertently it would cause the meter needles to swring in the wrong direction, though little other harm would result, for the polarity of the generator would immediately change again when the battery was properly connected.

In the Berdon system, the windings in the electro-magnetic field are so arranged that the output of the generator automatically increases with an increase in load. The increase is within certain well-defined limits, of course, the arrangement being that when the lamps all are lighted and a full lamp load is on the generator, there still remains sufficient current from the generator to charge the battery, provided that is necessary. If, for instance, the

BERDON MAGNETO-GENERATOR

battery were completely discharged and the car were driven at night, requiring that all the lamps be lighted, the generator output then would be proportioned automatically to the full load. If, however, the battery were fully charged and the lamps all lighted, then the generator would light the

SPLITDORF LIGHTING GENERATOR

lamps but would pass no current to the battery. Similarly, if the battery were exhausted and the lamps not lighted, the generator output would pass to the battery.

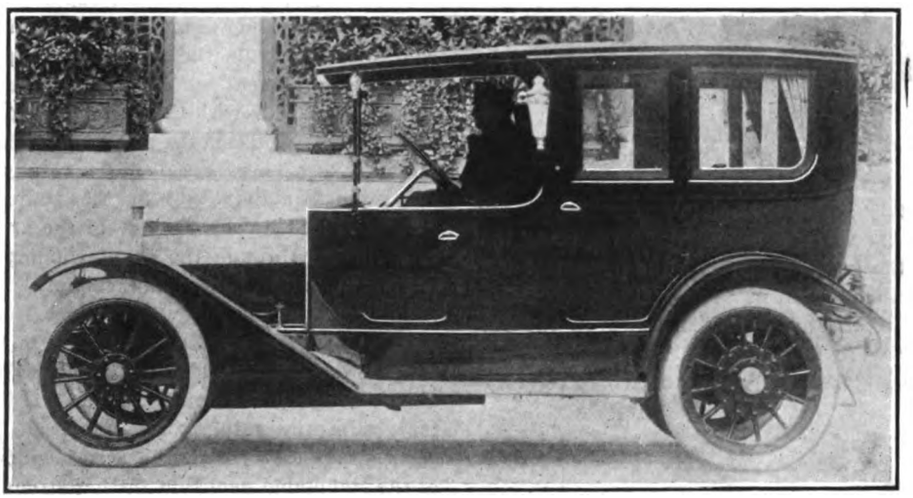
Care of Commutator and Brushes.

As is the case with the two simple systems that have been described previously, there is little in the Berdon system to get "out of kilter." The armature is the only moving part and, as it is mounted in ball bearings, lubrication even is reduced to an operation which requires to be attended to at infrequent intervals. The only part which could cause trouble is the commutator and brushes, but as the latter are so constructed as to make trouble extremely improbable the commutator is about the only element which need be watched. If it appears dirty, which is the most likely trouble, the application of a very fine grade of sandpaper will serve to remedy the disease. Care should be taken, however, to see that none of the particles of abrasive matter remain on the commutator.

Compound Winding and Its Effect.

In the Splitdorf lighting system, produced by the Splitdorf Electrical Co. of Newark, N. J., the method of output control is similar to that employed in the Berdon generator. That is to say, the main fields are permanent magnets and these are supplemented by a compound wound electro-magnetic field which permits the generator to produce more current at high speeds than would be possible with the permanent magnets alone Rotation of the Splitdorflite armature at a slow rate of speed results in the rapid "building up" of the auxiliary field produced by the passage of the armature current through the shunt winding of the compound field. Immediately this field becomes of sufficient strength, the electro-magnetic cut-out, contained in the arch of the permanent magnets, closes the circuit between the generator and the battery, with the result that almost all the current passes through the series winding of the compound field, thus further strengthening it. The output of the generator thus is practically constant, regardless of fluctuations in the speed of the armature, for the greater the current drawn by the battery the greater the flow through the series winding of the compound field and the more current there will be produced.

Sparking; Its Cause and Its Cure.



The Splitdorflite, like the others, is noticeably simple in construction, for which reason, if for no other, it seldom requires attention. The main bearings should be oiled occasionally, though care should be taken to see that the bearing at the commutator end is not flooded, or the familiar dark streaks will form on the commutator as the result of too much oil. Sparking at the brushes should be watched for as a sure tell-tale of loss of efficiency. When sparking occurs, the brushes should be taken out, cleaned and replaced, though no attempt ever should be made to change their position. Failure to generate generally can be traced to dirty brushes or commutator or loose connections, the correction of either of which faults scarcely requires a college education.

LIMOUSINE IS ADDED TO MERCER COMPANY'S LINE

Vehicle Is Low-Hung and Is Designed for Town Service or Touring—Accommodates Four Passengers.

In adding to its line a limousine, the Mercer Automobile Co. of Trenton, N. J., whose name has been no less spread by the prowess of its racing cars than by the reputation for consistency which its stock models have won for themselves, has borne in mind the growing demand for a comparatively small and light closed car that is suitable alike for town service and for extended touring during the season when temporary retirement behind plate glass becomes a necessity as much as a luxury.

COMPACT, WELL-BALANCED LINES OF NEWEST MERCER LIMOUSINE

To this end the limousine which forms the latest addition to the line and is styled model 35 E, has been kept within well-defined lines, though it is not too small to be thoroughly serviceable; within its cozy interior there are accommodations for four passengers, two of them occupying the rear seat facing forward in the orthodox manner and the other two occupying folding seats which are so arranged that when they are not in use they become so much a part of the upholstery scheme as to be very nearly invisible. Which means, of course, that they are completely out of the way and offer no obstruction against which the other passengers can knock their knees.

In conformity with the comparatively short overall length of the new car—the wheelbase is 118 inches—the height has been kept down as much as possible, the reason for the unusual design being as much to obtain a well-balanced effect of the whole as it is to obtain a low-hung construction unobtrusive in appearance and as stable as possible. An idea of the actual height of the roof from the road may be judged from the fact that the ordinary pedestrian on the sidewalk can glance over the top of the car quite easily.

The interior of the body is tastefully trimmed in dark colored broadcloth and the equipment includes all of the usual toilet articles and other devices that assist in lending an air of luxury. The body is mounted on the stock model 35AB Mercer chassis which is rated at 35 horsepower and carries the usual T-head 4½ x 5-inch Mercer motor. The clutch is of the multiple disk type, having 48 saw steel plates, and power is transmitted through the intermediary of a four-speed selectively operated change gearset in which the third speed is direct drive and fourth speed an overstep. The rear axle is of the full-floating type, carried on three-quarter elliptic springs, the front springs being semi-elliptic in conformity to standard Mercer construction. As is the case with all the other cars in the Mercer line, spare tires are carried in irons at the back of the body, leaving the running boards clear of obstructions and incidentally giving the clean-cut appearance so much sought for.

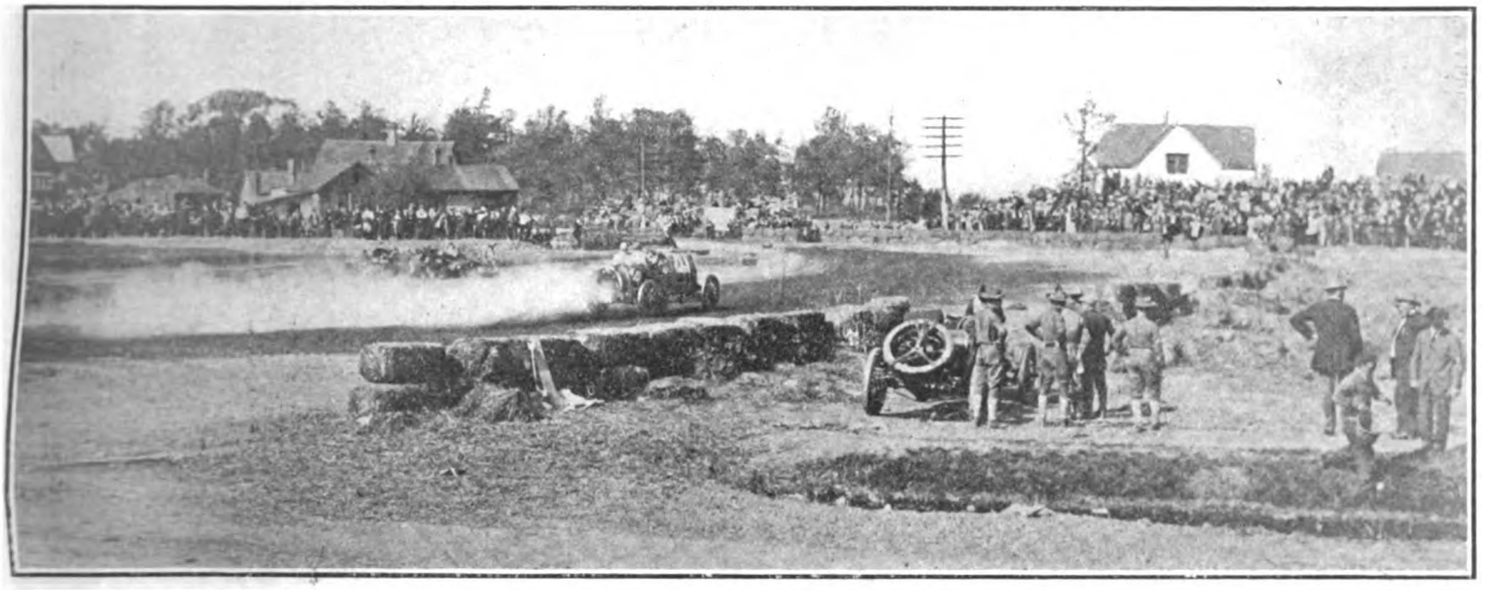
The Fable of Ante-Election Dullness.

Whether there really is any reason for it, it nevertheless seems to be true that business men always have looked for dull times during the months preceding a Presidential election; perhaps their having looked for it is the reason they found it. Suffice it to say, however, that the idea is being dispelled and the origin of the fallacy is aptly hit by a journal of the shoe and leather trade, which says:

"Once upon a time the Lion, the Tiger, the Hippopotamus, the Jackass and the Elephant assembled themselves together for the purpose of selecting a date when they would call a meeting of the representatives of all the Fishes of the Sea, Birds of the Air, and the Beasts of the Woods, so that they might select a ruler of all of these who should serve for a term of four years. At this meeting it was decided not only to elect a New Ruler every four years, but the Jackass was also appointed a committee of one to notify all of the Fishes, Beasts, Birds and Reptiles that in the years when the rulers were selected they would not be expected to hustle quite so hard for their daily food; in fact, that in these years they were to voluntarily go on Half Rations, and spend the time usually devoted to caring for themselves and their families in bemoaning the fact that they were what they were; and also predicting direful things that would happen just as soon as the New Ruler was elected. All of the animals, big and little, attentively listened to and were guided by the bray of the Jackass except the Bees. The Bees called a meeting, buzzed the thing over, and then through their Queen issued the following Proclamation:

"'We, the Bees of the universe, have attentively listened to and also carefully considered you and your braying, Mr. Jackass, and we wish to say that there will be nothing for yours truly in "Laying Off" or "Half Rations" line. We are satisfied that there will be just as much Honey in the buckwheat in the years when the rulers are elected as in any other old years and we propose to get it. If you and the rest of the bunch want to grow lean and waste one year in every four, why go to it; you certainly have our permission. Growl and bray your heads off, if you choose, but as for us we will keep right on gathering honey at the old stand.'"

Heat that Removes Stuck Piston Rings.



The application of heat is extremely efficacious in removing metal parts that are rusted or otherwise stuck in place. By the use of a little ingenuity, considerable trouble can be saved by temperature-raising processes. For instance, a stuck piston ring, which cannot be forced much without danger of breakage, almost invariably can be loosened by directing the flame of a blowtorch against the piston head until it becomes a dull red color, and then, after waiting a moment for the heat to subside slightly, applying a little kerosene to the rusted or carbonized joints. The ring that resists this treatment must be very badly stuck.

Iron pipe fittings or any other iron or steel parts that are screwed together will rust immovably in place if they are moistened with a little saturated solution of sal ammoniac, or even of salt, before being screwed together.

CONSISTENCY NETS BRAGG THE GRAND PRIZE

Covers the 410-Mile Hay-Protected Course in 359 Minutes—De Palma, Always a Dangerous Contender, Again Victim of Misfortune —Roberts and Endicott Take Minor Events.

"BREASTWORKS" OF BALED HAY ON FOND DU LAC TURN AFTER BEING "ASSAULTED" BY FONTAIN (LOZIER)

It is a far cry from the baled cotton which played such an important part at the battle of New Orleans, nearly 100 years ago, to the baled hay which constituted a not inconspicuous and not invaluable feature of the Grand Prize and other races which marked the Milwaukee speed carnival which was brought to a close on Saturday last, 5th inst., when the Grand Prize was gathered in by Caleb Bragg, driving a Fiat. The baled cotton and the baled hay, however, were utilized for the same purpose—to save American lives.

Hay as a preserver of life and limb during automobile races first was employed during the Elgin speed carnival in August last, but it remained for Milwaukee to put it to its fullest use. It formed the "breastworks" on all turns of the somewhat treacherous course and served alike to preserve spectators and competitors, forming a most efficient bumper. It did not avail to save Ralph De Palma, who won the Vanderbilt Cup race on the previous Wednesday, but it saved Louis Fontain, who twice ran wild when rounding two of the treacherous turns and charged full tilt into the baled hay. He somewhat mussed the hay, but his life and his limbs were preserved and his car escaped with little damage, as did the spectators and the Wisconsin militiamen who were on duty there.

De Palma sustained his accident on a comparatively straight stretch of the bumpy and undulating course. On the very last lap, when he endeavored to pass Bragg, the road proved too narrow, and in consequence he grazed Caleb Bragg's Fiat and flew the course with disastrous results. His car overturned and both driver and mechanician were badly injured. De Palma suffered a broken leg and a wound in the abdomen, which latter promised sad results but which, at last accounts, it was believed happily had been averted. His mechanician was less seriously hurt, bruises and a severe shaking up being his portion.

SUMMARY OF RESULTS
MILWAUKEE SPEED CARNIVAL.

Wednesday, October 2d
For the Vanderbilt Cup, 299.5 Miles.

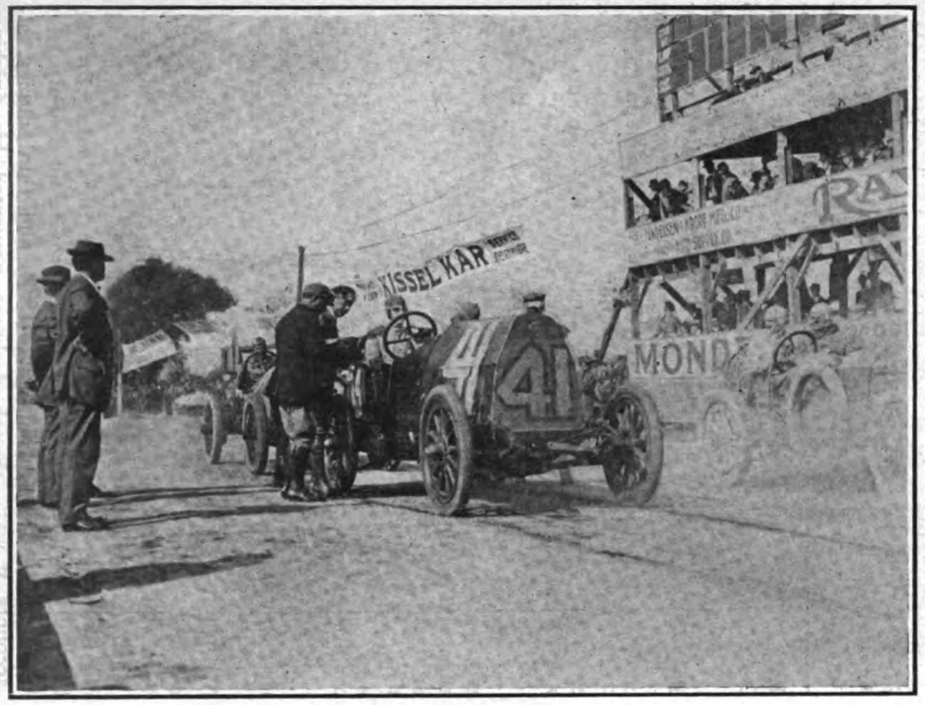
1.	Ralph De Palma (Mercedes)	4:20:31.54
2.	Hughie Hughes (Mercer)..	4:21:14.34
3.	Spencer Wishart (Mercedes)	4:36:37.75

Friday, October 4th
For the Pabst Trophy, 220.6 Miles.

1.	M. Roberts (Mason).....	3:45:08
2.	H. L. Hastings (Fal).....	4:15:05

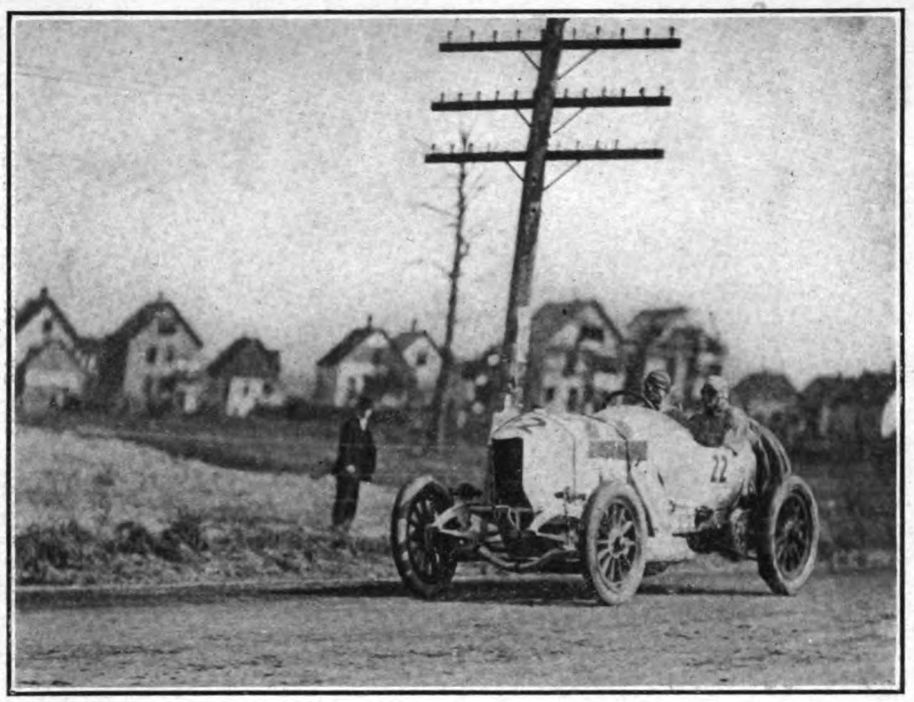
Friday, October 4th
For the Wisconsin Challenge Trophy, 173.5 Miles.

1.	Harry Endicott (Mason).....	3:05:44
2.	George Mason (Mason).....	3:42:40



Saturday, October 5th
For the Grand Prize, 409.9 Miles.

1.	Caleb Bragg (Fiat).....	5:59:27.49
2.	Erwin Bergdoll (Benz).....	6:14:58.38
3.	Gil Anderson (Stutz).....	6:15:22.47



Caleb Bragg won the Grand Prize handily. He covered the 409.76 miles, which represent 52 circuits of the 7.88-mile course, in 5:59:27.49, or at an average of 68.45 miles an hour. Second place went to Erwin Bergdoll, who brought the Benz car over the tape 15.31 minutes later; third and fourth places went to Gil Anderson (Stutz) and Barney Oldfield (Fiat), respectively. Anderson finished less than a minute later than Bergdoll, while an interval of four minutes separated Oldfield from the Stutz pilot. George Clark (Mercedes) and Robert Burman, who took Joe Horan's place in the Benz, were flagged while on their 49th and 48th laps, respectively.

As for the smaller car races for the Pabst and Wisconsin trophies, which were run on Thursday last, 3d inst., and which went for 220.64 and 173.36 miles, respectively, Mortimer Roberts took the longer of the two, covering the 28 laps in a Mason car in 3:45:08, and Harry Endicott, also in a Mason, took the other in 3:06:44. Roberts's average was 58.8 miles an hour; Endicott averaged 55.6 miles an hour for the 22 laps. Second place in the contest for the Pabst trophy went to Hastings (Fal), who finished in 4:15:04, and third money, although darkness prevented his finishing,

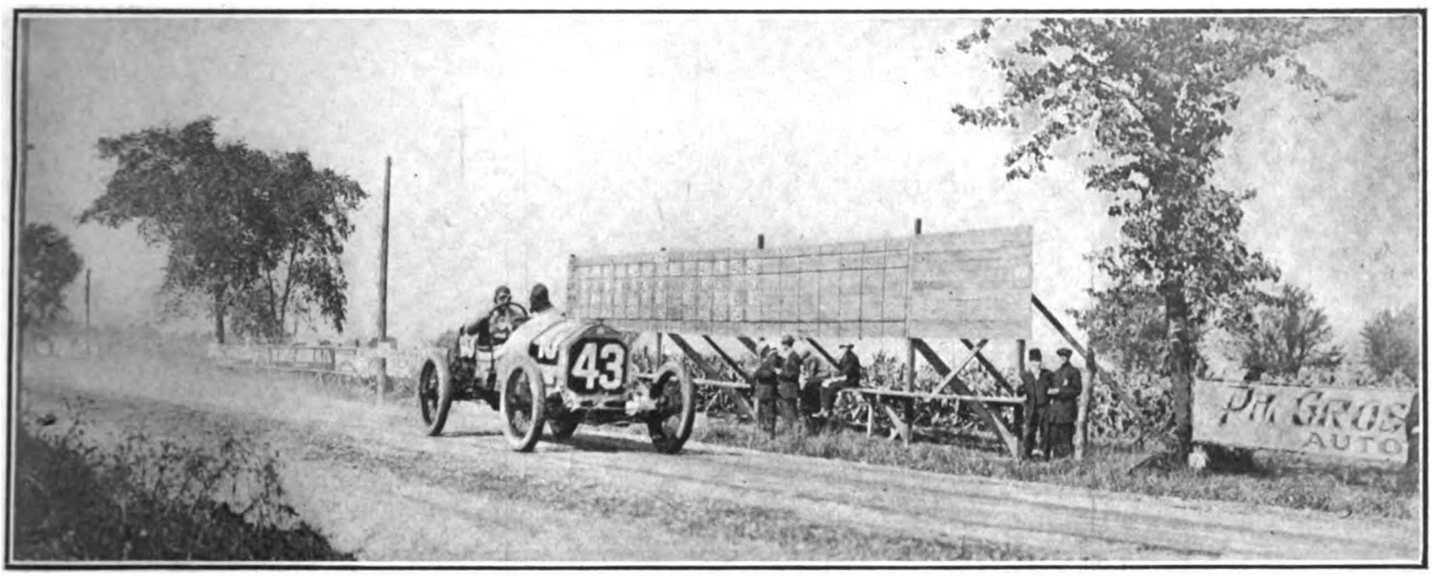
"ACTION" WHEN DE PALMA STOPPED AT THE PITS

HUGHES AND HIS WIRE-WHEELED MERCER ON GRAVEYARD TURN



Digitized by Google

to Chandler, also in a Fal car. Endicott's victory was in a measure a hollow one, for he finished over half an hour ahead of the only other contender, George Mason, his team mate, who completed the distance.

Entries in the smaller car events were not numerous. When, after delays occasioned by wet weather, which made the none too good course even more dangerous, the races were started at 1:30 p. m., but eight were lined up to contend for the Pabst trophy, and three only started in the smaller car event, Frank Kulick (Ford) having dropped out because of ill health, and John Heber (Studebaker 30) failing to put in an appearance.

Joe Nikrent (Case), J. Rooney (Bergdoll), Spencer Wishart (Mercer), H. Hartings (Fal), M. Roberts (Mason), Ed. Pullen drove a consistent but slow race. Chandler had about decided to retire when the announcement of the retirement of Hughes and Pullen opened the way for him to collect the "small change," provided he finished. He limped around the course at a 20 mile an hour pace and still was limping when darkness intervened, and those in charge decided to give him third place, although he had completed but 22 laps.

Endicott had it all his own way throughout the contest for the Wisconsin trophy. He took the lead during the first round of the course and held it to the end. Snyder (Mason), the only other contender besides Endicott and George Mason, quit on the second lap with a frozen clutch. So great was Endicott's lead over Mason after Synder's retirement that he had time to stop

ANDERSON IN HIS WIRE-WHEELED STUTZ AND A VIEW OF THE AD-PLASTERED COURSE

(Mercer), Chandler (Fal), and Hughie Hughes (Mercer) started in the Pabst event in the order named. Hughes early assumed the lead and held it until he was forced to retire during the 22nd lap with a broken differential pinion. Pullen, who had held second place as consistently as Hughes had clung to the leading position, assumed the lead when Hughes retired. His triumph was short lived, however, for he too was forced to retire during the 24th lap with transmission trouble. Roberts, who had trailed along after the two Mercer drivers throughout the major portion of the race, fell heir to the premier position and was not displaced throughout the remaining four laps. Spencer Wishart (Mercer) had been retired during the third lap with a broken crankshaft and a broken connecting rod had done similar duty for Rooney (Bergdoll) on his fifth lap. Joe Nikrent (Case) completed seven circuits, when he too was forced to quit with motor trouble. Hastings had had very little trouble and at the pit and smoke a cigarette before resuming his course.

Loafing did not characterize the running of the Grand Prize race. Sharply at 10:30 on Saturday morning the starting bomb was fired, and Burman led off in the Benz. He was followed at half-minute intervals by Fontain (Lozier), Tetzlaff (Fiat), Hughes (Mercer), De Palma (Mercedes), Wishart (Mercedes), Clark (Mercedes), Bergdoll (Benz), Horan (Benz), Anderson (Stutz), Oldfield (Fiat). Tetzlaff immediately set up a terrific pace, passed Fontaine on the first lap and completing the circuit in 6:20, he assumed the lead, which he held for 80 miles. Burman held second place throughout the second lap, but was forced to retire with a broken piston. Bragg then went up and was running 14 seconds behind the leader. The other ten contenders were strung out, with De Palma running third and Fontain (Lozier) in fourth place.

The end of the sixth lap saw Tetzlaff and Bragg in the same relative positions. Bergdoll had nosed out De Palma for third place and Anderson was running fourth. The others were strung out in the following order: Fontain (Lozier), Horan (Benz), Oldfield (Fiat), Clark (Mercedes), Hughes (Mercer). Spencer Wishart had been forced to retire while on his fifth round by a broken crankshaft.

Tetzlaff maintained his pace and increased his lead over Bragg. At the end of the eighth lap, when 63.04 miles had been reeled off, he was 42 seconds ahead of his most formidable rival. It was on this lap that Fontain swerved into the hay bunkers which protected the curve at Fond du Lac. Happily no serious damage was done, and after passing through the straw wall the driver piloted the car back onto the course and proceeded. The delay cost him his position, however, and he fell back to eighth place.

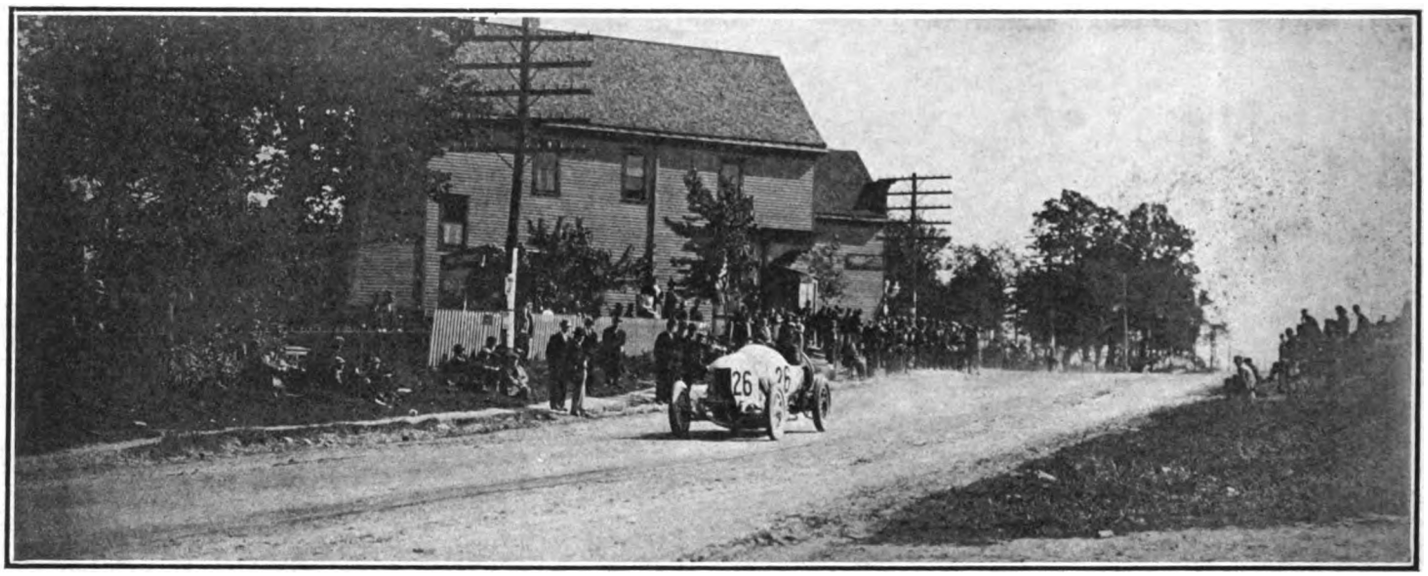
Forty seconds taken for a tire replacement at the end of the tenth lap cost Tetzlaff first place; it was then that Bragg went to the front and completed the 11th lap eight seconds ahead of Tetzlaff. Bragg did not long hold the position. The 12th lap saw Tetzlaff again at the head of the field with a lead over Bragg of 32 seconds. From this point until Tetzlaff finally was forced out of the race by a broken piston on his 30th round of the circuit, it was a case of see-saw between the two Fiat pilots. Bragg showed up in front at the end of the 14th lap, but was again passed in the 15th. Again in the 17th lap Bragg took advantage of Tetzlaff's stop for tire and fuel replacement and forged ahead and held the lead until half of the distance had been covered. At the end of the 26th lap, however, Tetzlaff again was leading the field.

When half of the 410 miles had been

Digitized by Google

completed the contenders were running in the following order:

Tetzlaff (Fiat)
Bragg (Fiat)
De Palma (Mercedes)
Bergdoll (Benz)
Oldfield (Fiat)
Anderson (Stutz)
Horan (Benz)
Clark (Mercedes)
Fontain (Lozier)
Hughes (Mercer)



Fontain broke a steering knuckle during the 29th circuit, due to the strain which had been placed upon the member when he went through the straw barrier for a second time during the 20th lap, and was forced out of the contest; Hughes also retired with motor trouble.

gather the laurels. At the end of the 51st lap, when Bragg had received the green flag denoting the beginning of the last lap, De Palma had cut down the lead of the Fiat driver to 2 minutes 20 seconds, and throwing all caution to the winds, the plucky Italian "let out" on the last lap and, overtaking Bragg at a point of the road which really was too narrow for two machines to pass, misjudged the distance, touched the Fiat car and spilled all over the road. Fortunately both De Palma and his mechanician were thrown clear of the car as it turned several rapid somersaults before it finally brought up at the roadside. De Palma, however, was seriously injured. He received, besides a broken leg —the same limb which was injured at Danbury, Conn., in 1910—a wound in the abdomen which aroused grave fears. His mechanician escaped with a few cuts and bruises and a very severe shaking up. Bragg went on and, receiving the checkered flag, reported the accident to the officials.

netos and plugs, as did also De Palma and Tetzlaff. Anderson used a Mea instrument, and a Rayfield carburetter. Bragg and Tetzlaff also used Rayfield carburetters, and Mort Robert's Mason was similarly equipped. Roberts used a Splitdorf magneto.

Wetmore Stars at Sioux City.

Three of the four events which completed the program of the Sioux City Automobile Club's track meet, which was run on the one-mile circular dirt track in the Iowa city on Friday last, 4th inst., were Wetmore events from beginning to end. Wetmore, who drove a Chalmers car, succeeded in taking the most interesting number, the 30-mile contest for Class C cars, from the other two contenders, John Rai-

SPENCER WISHART (MERCEDES) AND A TYPICAL ROADSIDE CROWD GATHERED AT A FAVORABLE VIEWPOINT

Tetzlaff pulled away from Bragg and was leading by over three minutes at the end of the 30th lap, but the end of the 31st saw him pull up at the pits with a cracked piston, which forced him down and out. Bragg then assumed the lead and never was headed. At the end of the 33rd lap he had increased his lead over De Palma, who, in turn, had widened the gap between Bergdoll and himself to 7 minutes. Anderson, Oldfield, Clark and Horan were strung out in the order named. Burman replaced Horan at the wheel of the Benz at the end of the 32nd lap.

Anderson ran into third place during the 37th lap and see-sawed for the position with Bergdoll until the end of the 44th lap, when he finally nosed out the Benz driver and took the place "for keeps." Bragg had in the meantime been increasing his lead over De Palma until the interval separating them was over 6 minutes. De Palma increased his speed considerably during the 48th lap, however, in a final effort to

Considering the condition of the course, which was bumpy and trying and too narrow on the straight aways, Bragg's time of 5 hours 59 minutes 27.49 seconds, although by no means record breaking, was fast. Fortunately balmy weather prevailed, so that the surface of the course was at its best, which, as before stated, was far from perfect.

The fastest lap of the day—and, indeed, the fastest lap on the newly constructed course—was made by Tetzlaff, who completed his 26th lap in 6 minutes and 8.3 seconds, or at a rate of 77.2 miles an hour.

Bragg's Fiat was Michelin equipped, as were also both Robert's and Endicott's Mason cars. Bergdoll rode on Fisk tires. Both Bragg and Bergdoll used Bosch mag-

mey (Ohio) and John Overmire (Colby), in 31:31, the ten-mile free-for-all in 10.41¼, and a two-mile Class C event in 2:35. The remaining contest, ten miles, Class C, went to Raimey, who completed the distance in 10:33. Overmire acquired trouble which forced him out of the two-mile event. The summary:

30 miles, for cars with displacements of 231-300 inches—Won by H. A. Wetmore (Chalmers); second, John Raimey (Ohio); third, John Overmire (Colby). Time, 31:31.

Ten miles, for cars with displacements of 231-300 inches—Won by John Raimey (Ohio); second, H. A. Wetmore (Chalmers); third, John Overmire (Colby). Time, 10:33.

Ten miles, free-for-all—Won by H. A. Wetmore (Chalmers); second, John Raimey (Ohio). Time, 10:41¼.

Two miles, for cars with displacements of 213-300 inches—Won by H. A. Wetmore (Chalmers); second, John Raimey (Ohio). Time, 2:35.

ENGLAND "STANDS PAT" ON HORSEPOWER RATING

Committee Recommends Retainment of Present Methods Which Take No Account of Stroke—Electrics Reclassified.

After nine months' consideration of the method of rating and taxing automobiles in Great Britain, the committee on Horsepower Rating of Motor Cars, which originally was appointed by the Treasury to investigate with a view to determining whether or not the present methods are fair to both the motorist and the government, at length has rendered its report. In it is set forth at great length that "the method or rating is substantially fair as between one car and another" and despite repeated requests that the committee consider the effect on horsepower of increasing the stroke, and in the face of the Royal Automobile Club's recent adoption of the piston displacement method of rating engines, which in itself is evidence of the necessity for eliminating stroke as a constant and taking it into consideration, it is recommended that the system of rating now in force be retained, with scarcely a change worthy of note.

If the recommendations of the committee are adopted, and it is altogether likely that they will be adopted, "petrol" engines, as they are styled, still will be rated according to their bores without regard to their strokes, despite the manifest unfairness of the system. According to the present method, which is recommended to be retained, the rating is obtained by dividing the square of the internal diameter of the cylinder by 2.5 as a constant in the case of a four-cycle motor, and 1.6 in the case of a two-cycle motor.

In the case of electric cars, the committee recommended that in view of the fact that electric motors generally average about 8 horsepower under normal conditions, such vehicles be rated hereafter between 6½ and 12 horsepower instead of between 12 and 15 horsepower. Provision also is made in the recommendations of the committee to provide for the taxation of motorcycles according to their horsepower; the present system exacts a tax of $5 irrespective of the size and power.

Opposite Rulings on Lighting Law.

Indication that there is merit in both sides of the question is found in two rulings on the law regarding the illuminating of cars which are left standing in the street at night, one decision coming from Connecticut the other from Iowa. In Connecticut several months ago it was decreed that a car left standing in the street at night should have its head and tail lights burning; now from Iowa comes the decision of Judge A. B. Thornell, of Harlan, that a car which stands on the street and the motor of which is stopped need not be illuminated. The decision, however, has been appealed.

Grennon and Kyle Share the Spoils.

Joe Grennon, who piloted a Mercer car, and Harry Kyle, who drove a Pope, shared honors at the five-event meet which was run on Saturday last, October 5th, on the half-mile Imperial track at Springfield, Mass. Each of the two men accounted for two races, and Grennon further distinguished himself by covering an exhibition mile in 1:24⅗. The remaining event on the program, which went for only half a mile, went to L. Menenghetti. The summary:

Ten miles, match race—Won by Harry Kyle (Pope); second, Joe Grennon (Mercer). Time, 15:28⅕.

Three miles, match race—Won by Joe Grennon (Pope); second, George Cook (Zust). Time, 4:27.

Five miles, for cars with displacements of under 450 inches—Won by Harry Kyle (Pope); second, Henri Hickman (Mercedes). Time, 7:47.

One-half mile, for cars with displacements of 300-450 inches—Won by Louis Menengretti (Zust); second, Joe Grennon (Mercer); third, Henri Hickman (Mercedes). Time, 0:49⅘.

Three miles, for cars with displacements of under 450 inches—Won by Joe Grennon (Mercer); second, Louis Menenghetti (Zust); third, H. Kyle (Pope). Time, 4:22⅘.

Glidden to Lead Tour to New Orleans.

Even though there will not be a National Reliability Tour this year, there at least will be a Charles J. Glidden tour, for Glidden himself has elected to lead a caravan of motorists over the identical route that originally was mapped out by the American Automobile Association; but it will not be for the Glidden trophy or for any other trophy. It is to be purely a sociability run and under the auspices of the Maxwell 50,000-Mile Club will start from Detroit on Monday, 14th inst., which was the date set for the start of the abandoned A. A. A. contest. The tourists expect to reach New Orleans, the one time destination of the A. A. A. tour, now deceased, on the 27th inst. Though the tour is being conducted by the Maxwell 50,000-Mile Club, and most of those who participate likely will drive Maxwell cars, even to Glidden himself, who will pilot a Maxwell of the type that last year helped bring home the trophy, it is open to all who drive, irrespective of the make or model of their cars.

DISBROW WINNER OF FOUR OUT OF SEVEN AT PEORIA

His Troupe Furnishes Entertainment for Implement Dealers' Convention at Two-Day Meet—Endicott and Nikrent Also Win.

Throughout the first day, at least, Louis Disbrow starred at the two-day racemeet which provided excitement for visitors to the National Implement Dealers' Association's Convention at Peoria, Ill., Friday and Saturday last, October 4th and 5th. Disbrow took four of the seven events on the program, including the feature number, the 10-mile free-for-all handicap, which he completed in 9:09. A five-mile free-for-all event also went his way, the distance being covered in 4:45 in the Simplex car. Endicott (Schacht) took two of the three events which remained on the program, and Nikrent (Case) disposed of the seventh.

Seven events were on the program for Saturday, and of these Disbrow "showed up" in three, the trio being time trials. Of the competitive events Endicott (Schacht) captured two, both of which went for five miles, his times being 5:00⅗ and 4:32 for⅗ for the respective numbers. Then ten-mile contest for light cars went to Wilbur (Fal) in 11:46⅘, and Monkmeier (Staver) disposed of the five-mile free-for-all in 4:46. The summary:

Friday, October 4th.

One mile, time trials—Louis Disbrow (Case), time 1:00⅗; Monkmeier (Staver), time 1:02⅘; Nikrent (Case), time 1:01⅘; Daubner (Halliday), time 1:10⅕; William Endicott (Schacht), time 0:58; Madden (Inter-State), time 1:03⅗; Disbrow (Fiat), time 0:54; Kilpatrick (Hotchkiss), time 1:03⅗.

Five miles, for cars with displacements of 231-300 inches—Won by Nikrent (Case); second, Disbrow (Case); third, Monkmeier (Staver); fourth, Daubner (Halliday). Time, 5:16⅗.

Five miles, for cars with displacements of 231-300 inches — Won by Endicott (Schacht); second, Madden (Inter-State). Time, 4:59⅗.

One mile, time trial—Disbrow (Fiat). Time, 0:52⅕.

Ten miles, for cars with displacements of under 450 inches—Won by Endicott (Schacht); second, Madden (Inter-State); third, Daubner (Halliday). Time, 9:49.

Five miles, free-for-all handicap—Won by Disbrow (Simplex), scratch; second, Kilpatrick (Hotchkiss), 30 seconds. Time, 4:45

Ten miles, free-for-all handicap—Won by Disbrow (Simplex), scratch; second, End-

Digitized by Google

cott (Schacht), 5 seconds; third, Madden (Inter-State), 45 seconds. Time, 9:09.

Saturday, October 5th.

One mile, time trials—Monkmeier (Staver), time 0:62; Nikrent (Case), time 0:57⅗; Madden (Inter-State), time 0:57⅗; Kilpatrick (Hotchkiss), time 0:58⅗; Disbrow (Simplex), time 0:51⅗; Wilbur (Fal), time 0:69⅗; Hastings (Fal), time 0:66⅗; Endicott (Schacht), time 0:54⅘.

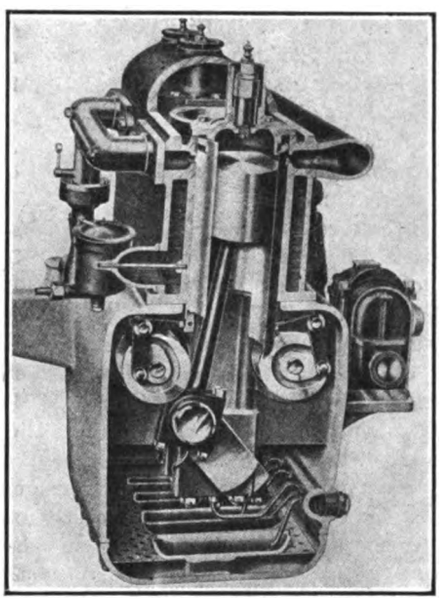
Ten miles, for cars with displacements of 231-300 inches—Won by Wilbur (Fal); second, Nikrent (Case); third, Hastings (Fal); fourth, Monkmeier (Staver). Time, 11:46⅘.

Five miles, for cars with displacements of under 451 inches — Won by Endicott (Schacht); second, Madden (Inter-State); third, Nikrent (Case); fourth, Wilbur (Fal). Time, 5:00⅗.

Five miles, free-for-all—Won by Endicott (Schacht); second, Disbrow (Simplex); third, Kilpatrick (Hotchkiss); fourth, Madden (Inter-State). Time, 4:32⅗.

Five miles, free-for-all handicap—Won by Monkmeier (Staver), 10 seconds; second, Madden (Inter-State), 20 seconds; third, Disbrow (Simplex), 40 seconds. Time, 4:46.

Hunter Scores in Non-Stop Contest.



To maintain a speed of 20 miles an hour for five hours, and only once to deviate from the scheduled time to the amount of 15 seconds, is not child's play. It was performed, however, by G. F. Hunter, who on Saturday last drove his Oldsmobile for 100 miles over Long Island roads in competition with sixteen other members of the Long sland Automobile Club in the century, non-stop, fixed-time run which had been carried over from November of last year. Penalties were charged agoinst the competitors for deviation from the scheduled time at the controls, five of which were provided between the start and finish point at Jamaica, and the turning point at Hempstead. One point was charged for each 15 seconds the contestant was late or early at controls. Penalties also were meted out for road work, except on tires, and for stops other than those made necessary by traffic.

By acquiring but a single demerit, Hunter won the Herriman trophy and a new tire. Second honors went to Herbert G. Andrews in a Buick, who had a total penalization of 2 points. The other contestants were: F. Toby (Panhard), W. C. Bolton (Cadillac), H. H. Hillborn (Herreshoff), R. J. Perrine (Cole), A. S. Jesup (Oakland), G. Atwood (Cadillac), William Schimpf (National), P. Brotherhood (Cadillac), John Middleton (Cadillac), J. W. Mowrie, Jr. (Studebaker 30), A. E. Beggs (Panhard), C. H. Galt (Packard), F. H. Newcomb (Elmore), H. L. Koenig (Peerless), F. Belbon (Studebaker 30).

SLEEVE-VALVE MOTOR OF RADICAL DESIGN

Of German Origin, It Suggests Knight and K-D, But Is Different—Details Nicely Worked Out.

As if to refute the claims so often reiterated, not alone by those who use motor cars but by those who design them as well, that the motor car of the present substantially is the motor car of the at least not distant future, and that in minor details only will it be changed, the Fischer car, which recently made its appearance on the German market, embraces many new and

FISCHER MOTOR PARTLY SECTIONED

even radical ideas that cannot fail to excite widespread attention.

Although the four-cylinder block motor which forms the power plant is of the sleeve-valve type, it is not a Knight motor nor is it similar in any manner, save in the fact that sleeves are employed. The design is not wholly unlike the design of the Knight-Davidson crescent valve motor, which made its appearance at the Boston show last February, but the constructional details are altogether different.

Unlike the construction which obtains in the K-D motor, in which the two valves entirely surround the piston, overlapping each other at the ends, and are separated from the piston by a stationary sleeve, with the Fischer motor, the two valves, each of which forms a quadrant arc with regard to the piston circumference, do not meet and they contact directly with the piston. The valves are mounted opposite one another so that the piston contacts directly with the cylinder walls at portions not covered by the valves. The valves truly are crescent shaped, and the pockets which serve to contain them are formed by regrinding the cylinders, so that an arc of smaller radius than the radius of the original bore is ground out of each side. Leakage past the sleeves at the tapering ends is prevented only by the most careful workmanship in fitting the valves.

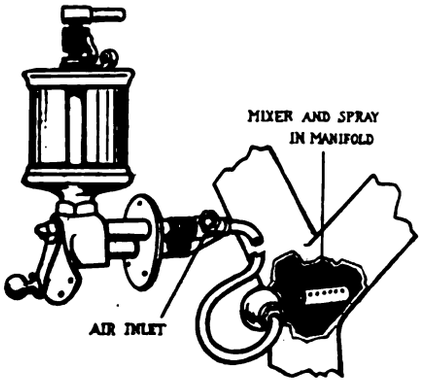
Motion is imparted to the sleeves through the intermediary of a cam shaft on either side of the crankshaft, both of which are operated by the orthodox gears. The cams which serve to operate the sleeves through a small bell crank are of the grooved type, whereby the action of the sleeves is made positive, and the timing exact. Lubrication is effected by means of a combination force feed and splash system embracing the use of the now familiar movable dams.

The design of the cylinder gear is unique. Each cylinder is fitted with a disk shaped head, not jacketed, and has cast in the center a hollow cylindrical projection which serves to house the spark plug. The disk is bolted in place as in orthodox construction, the use of a gasket being made unnecessary by virtue of the machined surfaces. When all of the separate cylinder heads are in place, a single casting, which serves to cover all four cylinders, is put in position and fastened by means of caps, which attach to the spark plug cylinders. As shown in the illustration, the latter casing forms a part of the water jacket, so that the head of each cylinder, though removable, is entirely surrounded with water, and the spark plug likewise is water jacketed, and moreover is adequately protected from mechanical injury.

Paper as a Material for Gaskets.

Fragile though paper seems to be, it is one of the best materials for making gaskets, shims or liners to be used where there is not sufficient heat to injure it. A good, hard paper is practically incompressible, so far as gasket making is concerned; it is, of course, very easily shaped and adapts itself to inequalities of surface. Even the heaviest pressures seem to have little or no effect on gaskets made of paper of good quality.

To Assist a "Starved" Piston Pin.



A piston pin which receives its lubrication through a hole drilled in the top of the connecting rod occasionally is "starved" because the hole does not catch sufficient oil. This state of affairs can be improved by countersinking the top of the hole to form a little basin to catch oil; the larger the area of the countersunk basin the more oil will be caught.

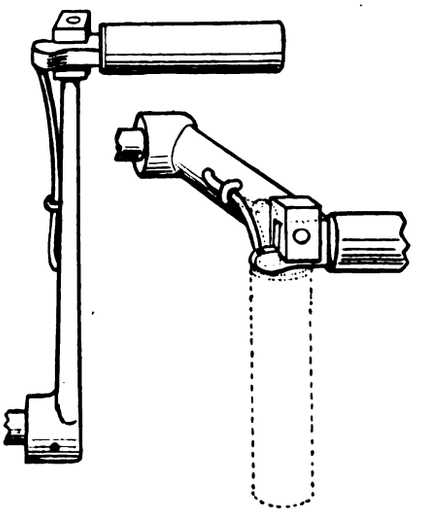
Digitized by Google

Starter That Aids Cranking.

The next best thing to having a motor starter that will work 100 per cent. of the time is to have a motor that will start every time on the first turn of the crank. Under such conditions cranking loses at least half its terrors in the case of a big motor, and in the case of a little one, nearly all of them.

The device shown by the accompanying illustration is designed to eliminate the disagreeable part of the cranking—every turn beyond the first being relegated to the "disagreeable" class—and its purpose is clearly indicated by its designation, the Buckeye sure starter; it is manufactured by the Central Brass & Fixture Co., of Springfield, Ohio. In addition to facilitating motor starting by a priming process, the device enables the air supply to be varied in accordance with momentary requirements, which very often results in

BUCKEYE SURE STARTER



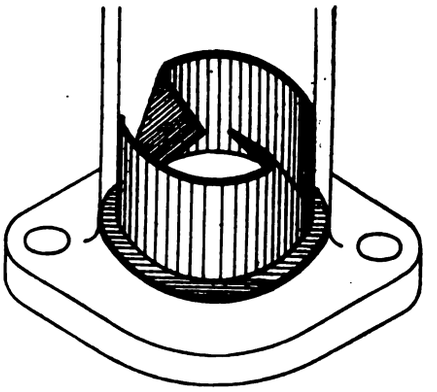
more economical running and a cleaner, cooler motor.

There is nothing complex about the Buckeye sure starter. On the dashboard of the car is mounted a brass fitting carrying a small glass reservoir for gasolene; from the reservoir a pipe leads to the intake manifold above the carburetter, the manifold being drilled and tapped to make the connection. A lever on the top of the reservoir permits the gasolene to be shut off or turned on at will. Below the reservoir is a second lever which controls an air opening on the other side of the dashboard. Thus either gasolene or air can be admitted to the intake manifold in any desired quantities within the capacity of the device, independent of the regular supply through the carburetter.

For starting the motor under ordinary conditions the lever on top of the gasolene reservoir is turned to the left until the gasolene level has fallen an eighth of an inch, and then shut off. This admits sufficient gasolene to the motor to permit easy starting without having to pump the cylinders full of gas from the carburetter. When the motor is running the air valve is opened and as much extra air admitted as the motor will take, the amount being regulated, of course, by the working of the engine. For high speed, the valve is opened wide and for low speed it is almost closed. A stop is provided to adjust the valve opening limits for motors of different sizes. By putting kerosene in the reservoir instead of gasolene, and allowing it to be taken into the motor while warm and turning over with the spark shut off, the cylinders can be cleaned of carbon, which will be loosened and blown out with the exhaust. For starting in very cold weather a little ether is mixed with the gasolene in the glass reservoir.

Folding Crank that Saves Wrists.

Newest of the devices designed to prevent the "deadly back-kick" of the gasolene motor cranked with spark advanced is the Wink safety folding crank, manufactured by the Wink Crank Co., of 2106 Superior Viaduct, Cleveland, O. As the accompanying illustration shows very clearly,



WINK SAFETY CRANK

the Wink device is peculiar only in one respect—that is, its handle, instead of being rigidly fixed to the crank arm, as is usual, is pivoted so that it is free to swing through an arc of quarter of a circle. A stiff steel spring, secured to the back of the crank arm, holds the handle normally in the plane of rotation of the arm; when the motor is to be cranked, the handle is swung around against the pull of the spring and is prevented from moving further than its normal cranking position by a stop. Of course, as soon as the handle is released it flies back under the tension of the spring, thus automatically folding. As the very great majority of injuries resulting from back-kicks are caused by the rigid handle striking the arm of the person cranking the motor, it is quite clear that with the handle out of the way, as it would be the instant after it was jerked out of the hand, most such accidents would be avoided, and this is the feature of the device that is most strongly emphasized by the makers. As the Wink crank is made in various sizes, it can be fitted to practically any car. It sells for $5.

Gasolene Mixer in Simplest Form.

In any auxiliary device designed for attachment to a motor simplicity of construction, of attachment and of operation are without doubt matters of no small importance, and in these respects the Wolf mixer, shown in the accompanying illustration, seems to have gone about as far as is possible. The device, which is marketed by A. M. Wolf, of 146 East 81st street, New York, is designed to be inserted in the intake manifold, pointing upward, having a flange to be gripped between the flange of the manifold and that of the car-

WOLF MIXING DEVICE

buretter. It consists of a short length of brass tube with two sections, at diametrically opposite points, bent inward, forming deflectors which cause the ascending current of air and gasolene to be violently agitated and spun into a spiral column, the result being the intimate mixing of the gasolene and air and the breaking up of minute particles of liquid gasolene. The mixer being made of a single piece of brass, there are no adjustments to make, no moving parts to wear and nothing whatever to get out of order.

"Pen Steel" for Small, Flat Springs.

For making small, flat springs or anything that should be made of thin sheet steel, an excellent material is "pen steel," which is the stock of which common pens are made. It comes in strips a few inches wide and in various thicknesses.

An old half-round file, with the teeth ground off and the edges ground sharp and smooth, makes an excellent scraper for scraping in bearings. Different sizes of scrapers can easily be made for different sizes of bearings.

1,016,987. Driving Mechanism. Walter O. Foss, Newington, Conn., assignor to Charles E. Bunnell and Richard Bradley, Branford, Conn. Filed Feb. 23, 1910. Serial No. 545,410.

1. The combination of a driven shaft, a driving shaft, a pair of gears surrounding said driving shaft, a pair of gears in mesh with the other pair of gears and connected with said driven shaft, the gears of one pair being of different diameters, means for alternately putting the gears of the first pair into driving relation with said driving shaft, a gear surrounding said driving shaft, speed modifying and reversing means co-operative with said last mentioned gear, means for alternately putting a member of the speed modifying and reversing means into driving relation with said shaft ,and means for throwing said last mentioned gear into and out of driving relation with one of said first mentioned gears.

1,017,073. Internal Combustion Engine. Edward H. Belden, Pittsburgh, Pa. Filed Nov. 8, 1911. Serial No. 659,204.

1. In an internal combustion engine, a cylinder in combination with a piston operable therein, a head wholly within the end of the cylinder and having both its inner end and its outer end circumferentially engaged with and guided by said cylinder, means securing said head against movement in said cylinder and effecting oil and pressure tight circumferential joints between the cylinder walls and head at said ends of the head, said cylinder and head having admission and exhaust ports intermediately situated therein, between said ends of the head and between the planes of said joints, and means situated between the ports in the cylinder and the ports in the head for effecting the opening and closing of said ports in time with the movement of said piston.

1,017,074. Internal-Combustion Engine. Edward H. Belden, Pittsburgh, Pa. Filed Nov. 9, 1911. Serial No. 659,441.

1. In an internal combustion engine, a cylinder and a piston therein in combination with a cylinder head fixed in the end of said cylinder, the inner and outer ends of said head being tightly jointed to said cylinder throughout their respective circumferences, the intermediate portion of said head being of less diameter than the adjacent portion of the cylinder and concentric therewith, an annular valve cavity being thereby formed between said ends of the head, one side of said head and cylinder containing admission and exhaust ports which open into said cavity, an annular valve of slightly greater diameter than the head and of slightly less diameter than said adjacent portion of the cylinder and occupying said cavity, said valve containing a port positioned to register with aforesaid ports, said head containing a balancing port approximately opposite the first mentioned ports, means for supplying oil to said cavity and means for rotating said valve in said cavity in time with the movements of said piston.

1,017,075. Internal-Combustion Engine. Edward H. Belden, Pittsburgh, Pa. Filed Nov. 9, 1911. Serial No. 659,442.

1. In an internal combustion engine, a cylinder and a piston therein, in combination with a cylinder head fixed in the end of said cylinder, the inner and outer ends of said head being tightly jointed to said cylinder, the intermediate portion of said head being of less diameter than the adjacent portion of the cylinder and concentric therewith, an annular valve cavity being thereby formed between said ends of the head, one side of said head and cylinder containing admission and exhaust ports which open into said cavity, an annular valve of slightly greater diameter than the head and of slightly less diameter than said adjacent portion of the cylinder and occupying said cavity, said valve containing a port positioned to register with aforesaid ports, said cylinder containing a balancing cavity opening into said valve cavity between the ports in the cylinder and in communication with the piston space in the cylinder and valve operating gearing deriving motion from said piston.

1,017,078. Automobile Glass Screen Cleaner. Henry F. Buth, Chicago, Ill., assignor, by mesne assignments, to Kimbo Co., Chicago, Ill., a Corporation. Filed Apr. 22, 1909. Serial No. 491,522.

1. In a window cleaner, the combination of a member, one end of which is journaled in and passes through the frame of the window, a handle connected with said end on one side of the window, the portion of the member on the other side of the window arching toward the window and with the end of the member standing in close proximity to the window and substantially parallel thereto, and a wiper connected intermediate its ends to the last said end of the member, and being disposed between said end and the window, said wiper resting and being held against the window by the elasticity of the member, said wiper being adapted to be moved bodily over the window.

1,017,128. Front Axle Drive. Rollo Robin Bell, Wichita, Kan. Filed Mar. 13, 1911. Serial No. 614,095.

1. In a drive mechanism of the class described, an axle, a collar former interiorly with a socket and at its diametrically opposite point with a boss, the axle having an arm fitting at its end in the socket and having an arm disposed at its ends in juxtaposition to the boss, a screw threaded through the boss and having a portion projecting into the end of the last mentioned arm, a ball race held within the collar, a series of bearing balls in the race, a hub rotatably fitted upon the collar, a disk held for rotation with the hub and projecting at its peripheral portion between the series of bearing balls, and a drive shaft fixed for rotation with the disk.

1,017,171. Automobile Wheel. Philip J. Rivers, New Rochelle, N. Y. Filed May 9, 1910. Serial No. 560,200.

A wheel comprising a hub provided with an inwardly projecting spoke receiving ring, said ring being provided on its inner surface with end shoulders, said hub having its inner face provided with an annular shoulder, a non-rotatable bearing ring within the spoke ring and spaced therefrom, said bearing ring being provided with a flange for engaging one of the shoulders of the spoke ring, anti-friction bearings interposed between the spoke and bearing rings and engaging the shoulder of the bearing ring and one of the shoulders of the spoke ring, a washer seated on the hub shoulder and engaging the bearing ring, a resilient ring for holding the washer in contact with the bearing ring, an axle casing having end arms, means for pivotally connecting the arms to the bearing ring, an axle projecting through the casing and provided with end arms, a spindle carried by the hub and provided with end arms, and means for universally connecting the axle and spindle arms.

1,017,186. Carburetting Device for Heavy Fuels. Alfred C. Stewart, Los Angeles, Cal. Filed Feb. 27, 1911. Serial No. 611,287.

1. In combination with an inlet means for an internal combustion engine and a carburetter for supplying air and oil in definite proportions, of a chamber connected to said carburetter and adapted to receive the oil therefrom and provided with means for collecting condensed oil, a connection from said chamber to the said inlet means for passage of vapor and air to said air inlet means, said connection being provided with a throttle and a connection from the lower part of said chamber to said air inlet means for passage of condensed fuel from said chamber to the said oil inlet means and means for supplying heat to said fuel connection.

1,017,198. Electric Motor Vehicle. Elmore W. Bender, Los Angeles, Cal. Filed July 13, 1910. Serial No. 571,703.

1. In combination with a motor-generator having field and armature coils, and a storage battery, a controller for and connected to the storage battery, and a motor-generator controller connected to the battery and battery controller and connected to the field and armature windings of the motor-generator and adapted to connect said windings together in series or multiple relation.

1,017,216. Fluid Clutch. Gustave T. Johnson, Chicago, Ill. Filed June 6, 1911. Serial No. 631,580.

1. A fluid clutch comprising a cylinder, a hollow rotor mounted eccentrically in the bore of the cylinder and in contact with the wall thereof at one point, the cylinder having passages opening at one of their ends into the bore of the cylinder on opposite sides of said point of contact, and said passages having their other ends opening through one end of the cylinder, a head on the last-mentioned end of the cylinder, said head having chambers which are in communication, respectively, with the aforesaid passages, one of said chambers also communicating with the bore of the rotor, and the other chamber communicating with the bore of the cylinder, a valve controlling the flow into the bore of the rotor, a driving element connected to the cylinder, radially sliding impeller blades carried by the rotor, and means for operating said blades.

1,017,226. Device for Indicating the Intended Movements of Vehicles. George S. Matthews, Kansas City, Mo. Filed Nov. 29, 1910. Serial No. 594,786.

1. An indicator of the character described comprising a central block, differently colored globes attached to the opposite ends of said block, caps fitted over the outer ends of said globes, a longitudinally extending rod secured to said caps, a protecting band passed around said block and projecting beyond the joints between said globes and block, said band being also connected to the longitudinal rod, electric bulbs in said globes, means to support the indicator upon a vehicle, and means to illuminate said bulbs either separately or at the same time.

1,017,359. Controlling Means for Explosive Engines. Louis C. Wolfe, Altoona, Pa. Filed Apr. 19, 1910. Serial No. 556,400.

1. In an explosive engine, the combination with supply controlling mechanism, of a movable motion transmitting device connected thereto and having spaced abutments, and an actuating member that is movable between and engages the abutments.

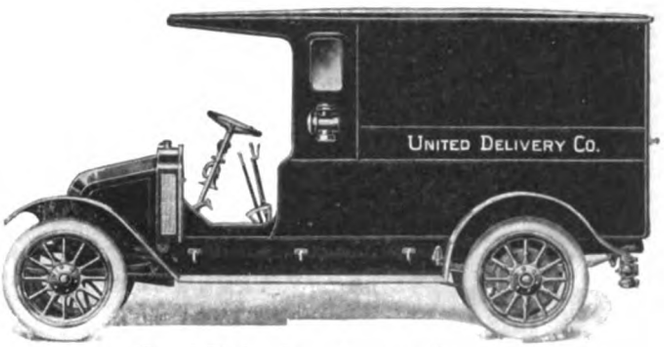
Stewart Delivery Cars



These Features Sell Stewart Cars

STEWART delivery cars have more strong selling points than any other delivery cars on the market. That's one reason why they are so easy and profitable to sell.

Here are some of the selling points that appeal strongly to the careful-buying merchant who figures closely the upkeep cost of delivery service.

1.—The Stewart costs less for upkeep, not because it never requires mechanical repairs — any piece of mechanism does—but because everything is **designed in units** and can be gotten at in a fifth or sixth of the time, thus saving much labor and greatly reducing expense. The labor cost for the yearly overhauling should be cut more than one-half on account of this great accessibility and removability of units.

2.—The **simplicity** of Stewart design helps keep down the cost of upkeep. The fewer and simpler the parts of a machine, the less likely they are to get out of order, and the more quickly and easily can they be removed and repaired or replaced.

Panel Body, Capacity 1500 Pounds

Open Express Body, Capacity 1500 Pounds

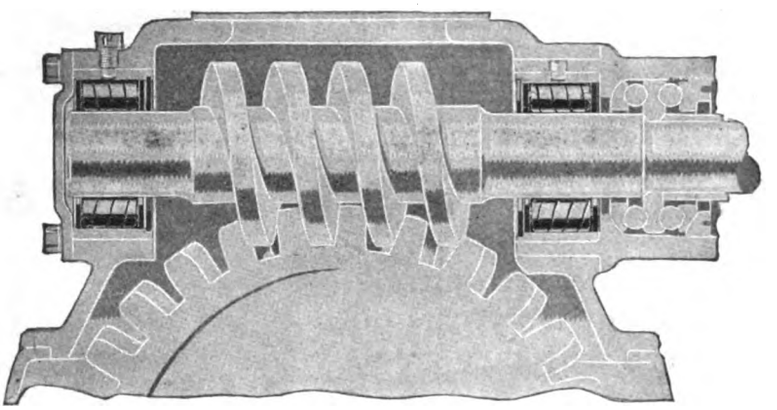
Other body styles include Express Body with Top, Stake Body, Wire Grating Body, Undertaker's Car, etc. A complete line to suit every business.

3.—The **small bore, long stroke, efficient motor** of the Stewart will appeal to the merchant's sense of economy. This motor, while it gives ample power for every possible use, is very economical of oil and gasoline, and causes little vibration—thus reducing wear and tear on the rest of the car. In a fleet of Stewart cars an extra motor or other unit kept on hand can be put into any car very quickly, thus necessitating no lost time for repairs.

4.—Stewart cars are made by a **strong,** amply financed company of **experienced** motor car manufacturers, having facilities for a large output. They know the commercial car business thoroughly and the cars they sell are built to meet the merchant's needs.

There are many other reasons why you should sell Stewart cars. Send for our catalog and our very liberal dealer's proposition.

Features Which Help Sell Stewart Delivery Cars



Continental Motor—30 H.P.
Brown & Lipe Transmission—
Timken Axles front and rear—
Multiple Disc Dry-Plate Clutch—
Big Tires—
Demountable Rims—
Wheel Base—126 inches.
Bodies of new design—Larger than usual, 7-ft. loading space.
Radiator at Dash—Out of harm's way—the popular construction abroad.
Complications Eliminated — Bosch single ignition (magneto). No spark lever, no batteries, timer, coil, etc.

A Bearing Well Born

BRINGING UNDER ONE ROOF the several steels which, worked together, unite to form a perfect Hyatt bearing, is no inexpensive operation. To appreciate this, one need but examine the rigid specifications—the result of careful study and extensive tests—or view the laboratories, complete in every detail, where all raw material is forced to undergo the scrutiny of trained chemist and physicist.

THE EXPENSE IS JUSTIFIED, however, in the added responsibility it places upon the worker in the shop and in the resultant high standard maintained in finished bearings. Each man knows absolutely there will be no loss through material proving defective. He therefore strives the harder to eliminate that other loss, "a poor workmanship."

GIVEN THE ENVIRONMENT of modern scientific methods and equipment specially adapted to the work in hand. Place in it material and workmanship as outlined above. It is then readily realized why the word "Hyatt" today means to all who know—a quality bearing.

RAYFIELD

Milwaukee Victories Clinch Title

CALEB BRAGG

WINS GRAND PRIX

Caleb Bragg driving a RAYFIELD equipped Fiat won. Never lifted the hood.

Fastest lap: Tetzlaff driving a RAYFIELD equipped Fiat-120; time, 6.07. An average of 77.4 miles per hour.

The First Time Any Car Equipped With an American Carburetor Ever Won the Grand Prix.

Rayfield Suggests Supremacy

Whenever a motor car wins a race, breaks a world's record, annexes an economy trophy, or leads the field home in an endurance run, the motor world **anticipates** it to be **RAYFIELD equipped.**

So consistent has RAYFIELD performance been in every branch of motor endeavor, that its victories are accepted as a matter of course—as a thing to be **expected.** The RAYFIELD wins on its merits, not because competition broke an axle on its last lap. There is nothing accidental about RAYFIELD success.

The RAYFIELD is supreme on the contest field only because it first meets practically and positively the exacting requirements of **every-day** service.

RALPH DE PALMA

Peerless in Competition Because Practical in Construction

The RAYFIELD is not a racing carburetor.

Every day in the week it is the winner of victories unheralded and unsung—en tour and on the boulevard, where motorists ask for unflagging utility, not speed—in the commercial field where persistent, dogged truck service has a money meaning all its own—the world over wherever consistent ECONOMICAL carburetion fills a 365-day-in-the-year want.

Therein lies our pride, not alone in the fact that the RAYFIELD in the last two years has broken more records in more different fields of competition than any other carburetor made.

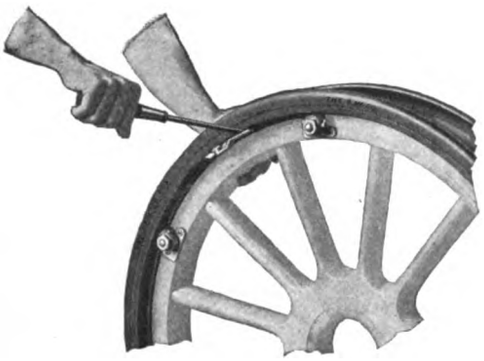
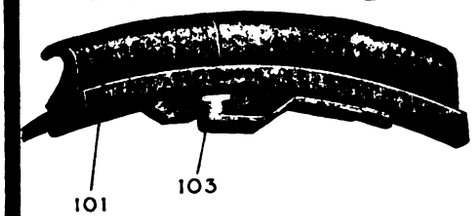
STANWELD

DETACHABLE
RIMS NOS. 50, 51, 52

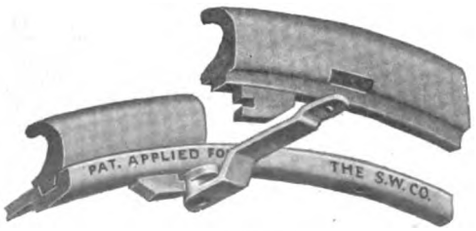


Cross section of STANWELD Detachable rim No. 50. For either straight side or clincher tires.

Cross section of STANWELD Detachable rim No. 51. For straight side tires only.



Cross section of STANWELD Detachable rim No. 52. For clincher tires only.



Method of unlocking latch.

Method of removing detachable side ring after latch is unlocked. Note position of latch.

DETAILS OF DETACHING MECHANISM.

Upper: Latch and ring locked.

Lower: Latch unlocked and ring partially removed. Note notch in base of ring which furnishes seat for screw driver.

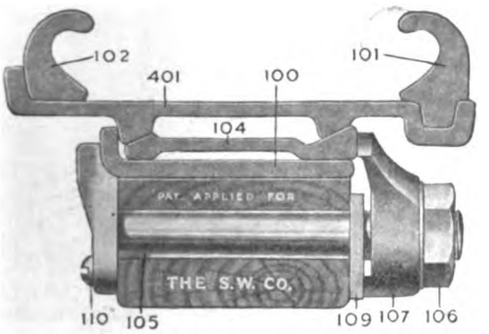
STANWELD Detachable Rims are made in three types. The only variation in the three types is in the form of the rim base.

As shown in the above illustrations, No. 50 is a Universal rim that will accept either straight side or clincher tires by simply reversing the side rings. No. 51 is made for straight side tires only and No. 52 for clincher tires only, although by reversing the detachable side ring and using a rim filler, type No. 52 can be used for straight side tires.

All three types of detachable rims, as well as the demountable rims, have the same detaching feature.

The wonderful simplicity of the detaching mechanism is apparent to all who are familiar with other makes of detachable rims.

To remove a casing or tube it only is necessary to remove the detachable side ring.



This ring is split transversely and has on either end slotted lugs which protrude through holes made in the rim base. These lugs are locked by means of a cam operating with a lever. The lever, when in locked position, holds the wide portions of the cam in the recesses of the lugs and thereby prevents their release. The latch is held in place by means of a small projection on the end of the lever, which fits into a recess made in the rim. A screw driver or similar tool is the only article required to operate these rims. First, the screw driver is inserted between the latch lever and the rim, and the ball catch pried from its seat in the rim. The latch is then swung outward as shown in the accompanying illustration and the ring pried from the groove. Only a mild effort is required to work this device and the position of the casing need not be altered to remove the side ring.

All STANWELD Rims are made of steel of a special composition and according to our own rigid specifications. They are guaranteed to be accurate to standard dimensions and perfect in form. They are thrice inspected before shipment, given a triple coating of galvanizing, and are mechanically the easiest and quickest operating detachable rims made.

STANWELD

DEMOUNTABLE
RIMS NOS. 30, 40, 41, 42

No.
100. Felloe Band.
101 Detachable Side Ring.
102 Endless Side Ring.
104 Adjusting Ring.
105 Bolt.
106 Clamp Nut.
107 Clamp.
109 Clamp Washer.
401 Rim Base.

Cross section of STANWELD Demountable Rim No. 40.

STANWELD Demountable Rims Nos. 40, 41 and 42 are acknowledged by experts to be the most perfect Demountable Rims ever constructed.

They embody a quick detachable feature which operates independently of the demounting device. This detaching mechanism is the same as that used on STANWELD Detachable Rims Nos. 50, 51 and 52.

STANWELD Demountable Rims are the only rims that have the rim base perfectly supported at all points of its front and rear circumference.

They are the only demountable rims that do not require lateral movement of the rim base to tighten same on the wheel and are, therefore, the only demountable rims which have at all times a perfect lateral and concentric position on the wheel. Tires cannot wobble on STANWELD Demountable Rims.

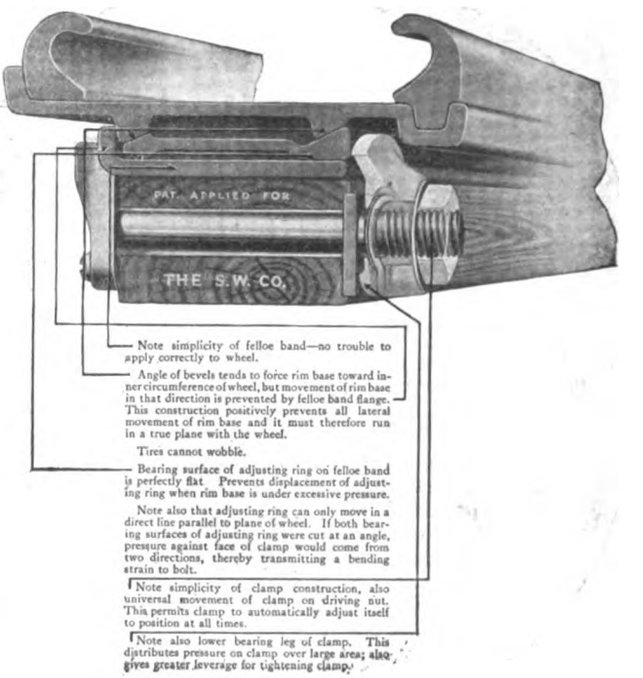
The rim base is tightened by universal radial expansion effected by the tightening of clamps against the adjusting ring.

Owing to the peculiar construction of these rims no direct strain ever is placed upon the clamping devices nor does vibration of the rim base while traveling over rough roads cause friction between the clamps and the surface on which they bear, and wearing away of these parts is therefore prevented.

No handling of clamps with fingers is necessary, as the mere turning of the clamp nut with a wrench or brace unlocks the clamp and turns it clear of the rim where it remains without tightening.

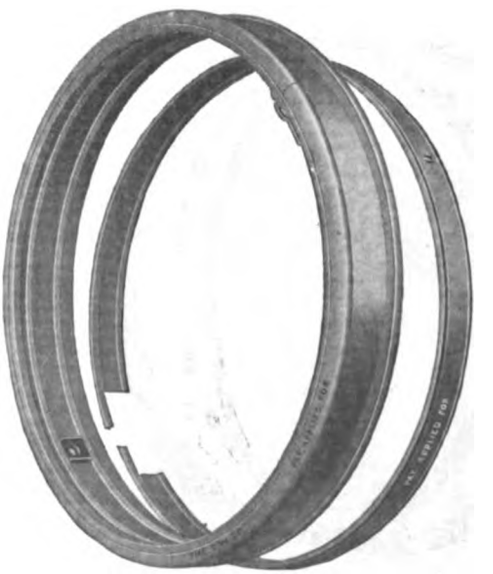
Operation of STANWELD Demountable Rims is at all times certain. Rust cannot affect the easy working of parts. There are no complicated pieces to get out of adjustment or that can be damaged by ordinary service.

A wrench or brace and a screw driver are the only tools required to operate STANWELD Demountable Rims. Freezing of parts is practically impossible, and the rims can easily be operated after having been on the wheels for many months.



To demount the rim it is only necessary to give each clamp nut a couple of turns. This operation automatically unlocks the clamps and the rim with tire can easily be removed from the wheel.

STANWELD Demountable Rims cannot of themselves work loose. They will not squeak or rattle while in service. They will not shift on the wheels and will long outlive your car, giving good service to the last day of their use.



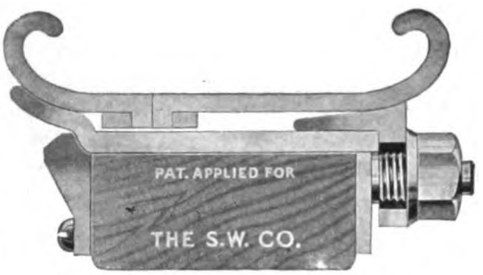
STANWELD Demountable Rims are exceedingly light in weight. Each part is made from material best suited to the functions of that part, and there has been no conservation of time or money to bring them to a point of perfection unattainable by others.

STANWELD Demountable Rims are without qualification superior to any demountable rims ever constructed.

They have been chosen as standard equipment on the cars of many of America's largest and foremost automobile manufacturers.

Section of STANWELD Demountable Rim No. 40 showing clamp mechanism.

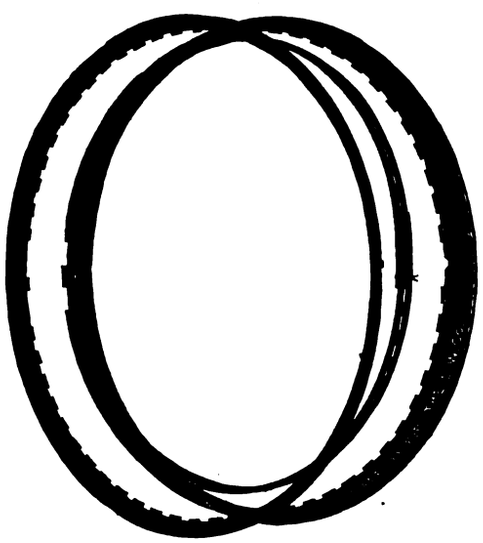
Adjusting ring removed from rim base.



Digitized by Google

STANWELD

DEMOUNTABLE
RIMS NOS. 30, 40, 41, 42



STANWELD Demountable Rim No. 30, locked on wheel.

Cross section of STANWELD Demountable Rim. No. 30. Clincher type.

Cross section of STANWELD Demountable Rim No. 30. Straight side type.

Detaching mechanism of STANWELD Demountable Rim No. 30. Rings forced in to show construction.

STANWELD Rim No. 30 is a circumferentially split rim differing considerably from other types of STANWELD Rims.

It is designed for those who require a demountable rim of exceedingly light weight. Although it is the lightest practical demountable rim made, it has sufficient strength to withstand any strain or pressure that may be imposed upon it.

The demounting mechanism consists of several wedges operating on bolts which extend through the wheel felloe and support the felloe band at its rear circumference.

This construction constitutes the most simple and strongest demounting mechanism yet devised for the securing of a removable rim to the wheel.

The detaching device consists of two flat spring rings of semi-circular form, one end of each being riveted securely to the wider portion of the rim base.

Each section of the rim base has inwardly protruding lugs which correspond with those of the other section. When the two sections are locked, these lugs are tightly bound together by the spring rings which have slots made to fit the lugs.

The free ends of the rings are locked by means of a swinging latch which in turn is secured by a cam lock. All parts of the detaching mechanism are permanently fastened to the rim base, and there are, therefore, no loose parts.

No circumferential movement of either section of the rim base is necessary to detach tires. No special tools are required to operate this rim.

Rusting of parts will not prevent the easy operation of STANWELD Rim No. 30, as there is no friction to overcome when operating.

For extreme simplicity, minimum weight and great strength, this rim cannot be duplicated.

STANWELD Rim No. 30 is made in both straight side and clincher types and in all the popular sizes.

This rim is being used as Standard equipment on many of America's most luxurious cars.

This is the Announcement of a Change in the Policy of Marketing the

Electric Warm Hand Wheel

When we first decided to place the Electric Warm Hand Wheel on the market our plan was to sell the heating device together with the necessary wiring and attachments so that the purchaser might wrap and mount this device upon his own steering wheel. We find, however, that this plan is absolutely impractical and impossible.

The buying public will not take the pains to perform this work as it should be performed and as a result, if we were to continue to market this wheel in this manner, the carelessness on the part of the consuming public would cause us a lot of trouble in many ways. This being true, in future the Electric Warm Hand Wheel will be sold as a completely installed unit upon an extra steering wheel. In other words, instead of selling only the heating device and the necessary attachments we will sell these, correctly mounted on the rim of a steering wheel, which is identical with the wheel upon the car for which the heater is intended. So that the consumer, when he purchases an Electric Warm Hand Wheel, needs only to remove the rim of the steering wheel upon his car, substitute the rim we send him, and connect the wires.

In order to market the Electric Warm Hand Wheel in this way, it will be necessary for the retail price of this rim to be $15.00 instead of $10.00 as originally planned.

You can readily see that this is necessary for we are put to more expense under the new condition than we will receive out of it by the raise in price. But we are convinced that it is absolutely necessary for us to take this step, and in consequence from this date the Electric Warm Hand Wheel will be marketed as outlined herewith.

This does not interfere with the discounts, or dealers' proposition, in any way, but rather it makes a better proposition to them than heretofore.

Remember that the Warm Hand Wheel is a necessity right now and should be on every car and in use until late next Spring.

We still have a lot of good territory open which we will be glad to give to the right men. Better get in touch with us at once.

Warm Hand Steering Wheel Company

527 FIFTH AVENUE, NEW YORK

"The Horn that's Made for the Discriminating"

TUTO HORN

THE TWO TONE HORN

A Profitable Guarantee.

GOODS manufactured by reliable concerns do not require a guarantee, as the entire future of that factory is dependent upon making a reliable product and seeing that the operation is satisfactory when in the consumer's hands.

¶ The most liberal guarantee will fail to make good breakage and poor operation if the design is inefficient, and especially if the manufacturer is not sufficiently expert to make the necessary improvements.

¶ Then some guarantees are written to protect the manufacturer rather than the customer. This is especially true when the product is of a complicated or breakable character and requires constant care and attention to keep in efficient operation.

¶ In the latter case if the operating instructions are not carefully followed, this apparently liberal guarantee becomes null and void and full prices are charged for all repairs and adjustments.

¶ The operating portion of the TUTO horn is guaranteed indefinitely and there are no rules which require that it be overhauled, oiled and otherwise inspected at frequent and stated periods. In fact, we know that the TUTO horn will last longer than the best car upon which it can be installed, without these working parts becoming defective.

¶ Then there is nothing to require lubrication or constant attention and adjustment, so that this liberal guarantee merely indicates our faith in our product and our willingness to make good what few defects that might escape our most rigid shop inspections.

¶ Naturally, the electric warning signal, with this kind of gurantee, and capable of producing a low note for regular service, taking the place of the bulb horn, and a loud note for emergencies—through the manipulation of one button—is the best equipment for any motor car.

¶ There is nothing better for standard equipment as the car manufacturer is not bothered by a request to make good on a "paper" guarantee.

The NATIONAL COMPOUND MIXER & PRIMER

SAVES 10% to 40% FUEL

Increases Power Speed and Flexibility

We Guarantee This

KILLS CARBON TROUBLES

Makes the Engine Run Better and Last One Third Longer

We Guarantee This

A device that will reduce expense and increase efficiency. Every customer of yours who is looking for the most and best out of his automobile, will take a buying interest in this device if you will simply demonstrate it, for we can prove that it will

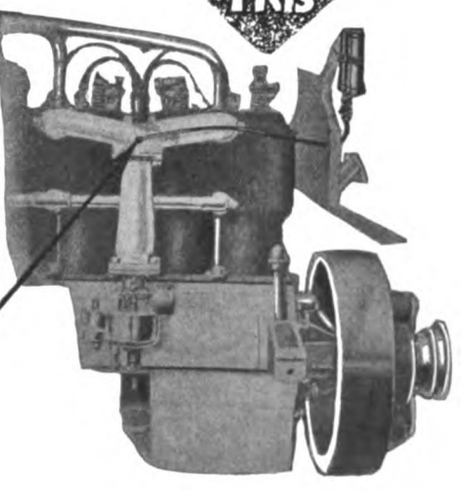
Save from 10 to 40 Per Cent on Gasoline Bills
Increase Power from 10 to 40 Per Cent
Save 50 Per Cent of Engine Trouble
Prime the Engine Clean the Engine

We show it here—a small, compact, simple apparatus, attached to the dashboard—installed in 20 minutes—never out of order—can be operated in an instant.

The National Compound Mixer breaks up and mixes in exact proportion every drop of gasolene with the proper amount of air. In other words, it finishes the work the carburetor leaves undone and we do not have to tell you that ordinarily only about one-half of the gasolene is converted into gas.

The Priming Feature

alone is particularly valuable in that every cylinder can be instantly primed by simply operating the priming valve, which sends a proper amount of rich mixture into all cylinders, making starting easy under all circumstances.



It Cleans the Engine

A couple of ounces of alcohol or kerosene dropped into the primer will, through a simple operation, clean the engine in a remarkably short time, thoroughly burning out every trace of foreign matter.

Your Customers Need It

and you can supply it if territory is open in your vicinity. It is distinctly up to you to write for our proposition. There is money in it for you.

National Manufacturing Co.
KALAMAZOO, MICHIGAN

$100 CASH

For Your Ideas

For the best ideas and suggestions written by a Dealer—for Dealers —on how to deal with the "used" or "second-hand" car situation.

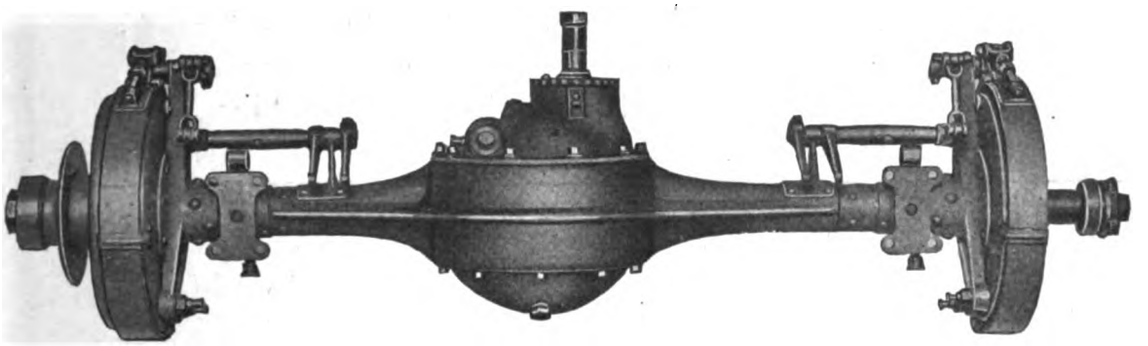
What's to become of the used cars? Who are the best buyers? What's the best way of getting in touch with them? Is it liner ads? Do you quote prices or don't you? Should they be displayed in the show windows? What is the basis of the allowance to make for trade-ins? These and a hundred other questions are bothering Dealers. Have you the solution or the remedy? What is it? How do **you** handle the situation?

Motor World will award $100, divided into four cash prizes of $50, $25, $15 and $10, respectively, **for the best articles or best ideas** on

HOW TO SOLVE THE

Used Car Problem

What we want is your **ideas,** your methods. It doesn't matter how you write—never mind the style or the dress, we want the IDEAS and the FACTS. Don't fear competition—your story, your plan may contain just the very idea we are looking for. If it does, you will get one of the prizes. In any event you will have a grand chance to exchange ideas with other Dealers through the reading columns—and the old saying, "two heads are better than one," applies to the used car situation as much as to anything.



Write us today. Tell us how **you** do it or how you think the situation could or should be handled. Address your letter to "Used Car Competition" Editor, Motor World, 1600 Broadway, New York City, N. Y.

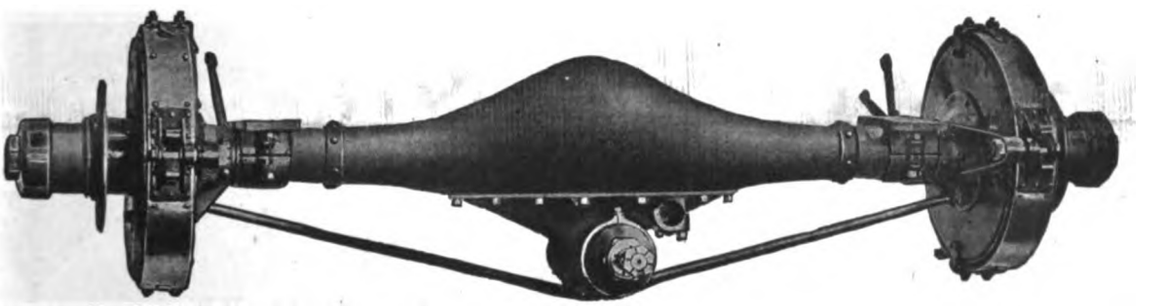
American

American Axles

The perfection of their design underlies the Economy secured by their use



The special features that place *American Axles* in the foremost place, whether our Bevel Drive or Worm Gear Axles are considered, is not merely a matter of pride and satisfaction to their users.

Quality—mechanical excellence—in this case spells economy as well as the highest degree of efficiency.

The patented features that make *American Axles* distinctive are precisely those characteristics that render them marvels of light running.

Eliminate friction and you gain proportionately in available power, whether that power comes from a gasoline or an electric motor.

In *American Axles* only have you the choice of Bevel Gear or the Lanchester-Daimler Worm Drive, because we hold the exclusive American rights as axle manufacturers using the last named gear, which was accorded first place abroad—after years of test—before it was added to the American line by us.

It Will Cost Your Customer $1. to Double His Tire Mileage

This is a pretty strong argument for you to use in the sale of Gilmer Tire Repair Pliers, and the best part of this claim is that it is absolutely true. Gilmer Tire Repair Pliers, plus a few moments time every once in a while, will absolutely double the life of your customers tires.

If you are one of the many who has not received his shipment of Gilmer Tire Repair Pliers, we crave your further patience.

The unprecedented demand for these pliers has made it impossible for us to keep up with shipments. However, we are installing new machinery and shortly will have our capacity up to 3,000 sets of pliers per week.

In the meantime, shipments will be made just as rapidly as possible—all orders now on hand will be shipped positively before October 15th.

This is true because the tires are injured by small cuts and bruises which, if neglected, develop into blow outs. As a matter of fact, tires no longer wear out but blow out long before their service should end.

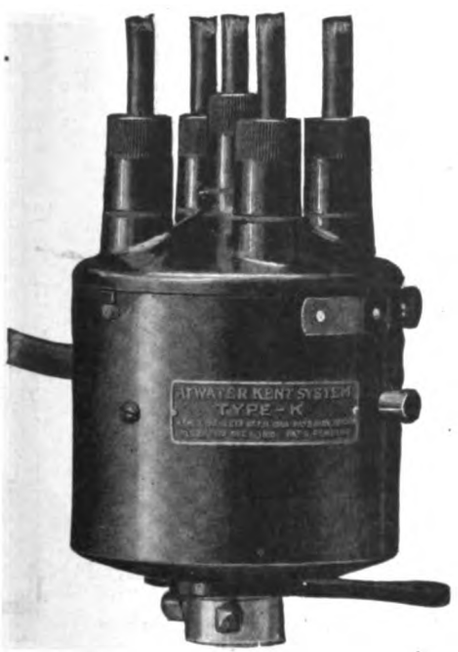
It is to enable your customer to protect his tires against these small injuries that Gilmer Tire Repair Pliers have been put upon the market. They make it possible for the tire user to open up the cuts clear to the fabric, thoroughly cleanse them and then insert a piece of rubber gum into the cut in such a way as to make the repair as strong as the original tire.

Nobody who has used rubber gum for repair under the ordinary conditions that obtained before the advent of Gilmer Tire Repair Pliers will need any urging to buy a set of these pliers. They will realize without argument that Gilmer Tire Repair Pliers alone make possible a perfect repair.

GILMER TIRE REPAIR PLIERS

G. WALKER GILMER, Jr.

52 North Seventh Street **PHILADELPHIA, PA.**



The illustrations at the right indicate the method of using Gilmer Tire Repair Pliers. First, the pliers are inserted in the cut. Then, as shown in the center, the cut is spread apart by pulling the lever "A," the end of which catches in a ratchet and holds fast wherever it is set until the cut is widely extended and the fabric exposed. The cleaning tool "B," is then used and the cut thoroughly cleaned, then a piece of rubber gum is placed on the cleaning tool "B" and pressed down against the fabric of the tire. The pressure of the hand against a spring releases the jaws of the pliers and the cut closes over the inserted rubber gum, making the repair as strong as the tire was when it was new.

The New Atwater Kent Ignition System

With Automatic SPARK ADVANCE

DISTRIBUTORS

New York.....E. J. Edmond Co.
Chicago.....Motor Car Supply Co.
San Francisco, Chanslor & Lyon M. S. Co., Weinstock-Nichols Co.
Milwaukee.....Julius Andrae & Sons.
Omaha.....Omaha Rubber Co.
Chattanooga.....Sanford Bros.
Dallas.....Fisk Co. of Texas.
Denver.....Auto Equipment Co.

Of extreme interest to every motorist

THE Automatic Spark Advance feature of the Type "K" Atwater Kent System is a long stride forward in ignition practice.

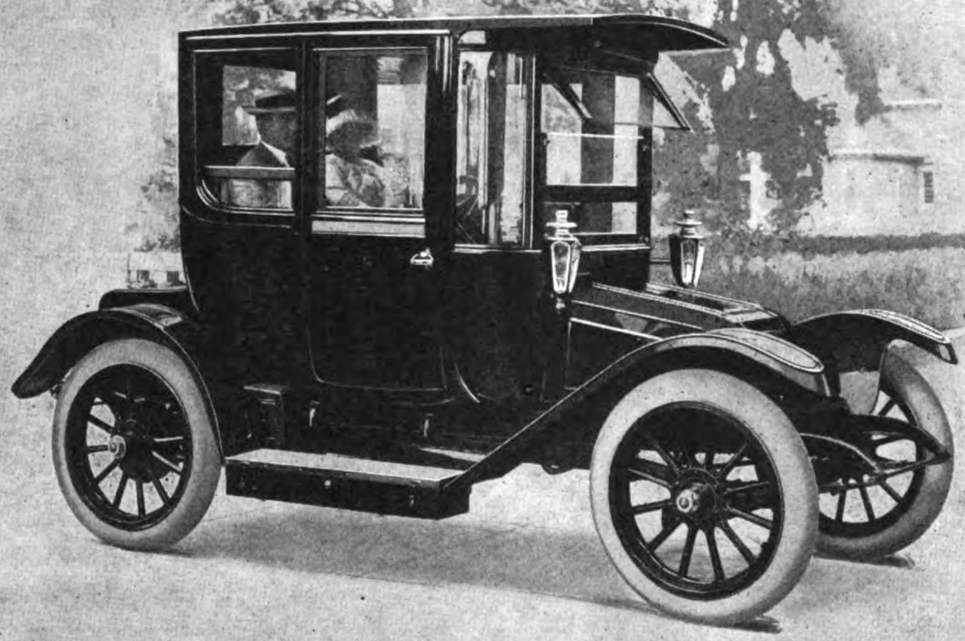
With this device, the control of the spark timing is entirely automatic (although the hand lever can be used if desired). This means that the spark is always properly timed to get the greatest possible power from the motor at any speed from three to seventy miles per hour.

No human mind can follow accurately the speed variations in an automobile motor and accordingly regulate the spark setting to get the best results.

The automatic spark control of the Atwater Kent System is more than human in its performance—it is sensitive to the slightest variation in speed—immediate in its response and positive in its action. The operator can forget his spark lever, knowing that his spark is being better regulated than he can do it himself.

The increased safety due to the automatic retarding of the spark for starting is alone more than sufficient to commend it to the modern motorist.

The Type "K" System is especially adapted for use in conjunction with lighting and starting equipment, or as sole ignition in place of the high-tension magneto. We regard it as being fully up to the high standard of merit for which Atwater Kent equipment is known.



Interesting Booklet D and detailed information sent upon request.

Atwater Kent Mfg. Works

Buffalo Electric

DEALERS

THE car above is indicative of the style and design of all Buffalo Electric models for 1913.

In the past electric motor cars have made a special appeal to the eye. The mechanical construction has seemed a secondary consideration to the coach maker's art.

Buffalo Electrics mark an advance in their field. Engineers and designers with an extensive knowledge of electric pleasure car construction have worked hand in hand to achieve the proper combination of mechanics and beauty.

In fact, our Engineers are equally as important sponsors as our designers in announcing our models for 1913.

Model 29 Roadster . . . . $2600 F. O. B. Buffalo
Model 30 4 Passenger Coupe . $3200 F. O. B. Buffalo
Model 30-B 4 Passenger Coupe . $3300 F. O. B. Buffalo

Opportunity

WE are now assigning desirable territory to representative and responsible dealers. Our selling policy is broad gage, and embraces in its scope an exceptional opportunity for your success. Advertising co-operation of the sales making kind supplements a national campaign. Buffalo Service is in advance of the times and insures the co-operation of our inspectors and experts in matters of care and maintenance of cars, batteries, or your selling efficiency.

We also manufacture commercial wagons and trucks from 1000 pounds to two ton capacity, and a line of industrial baggage or stock trucks for factory and dock use.

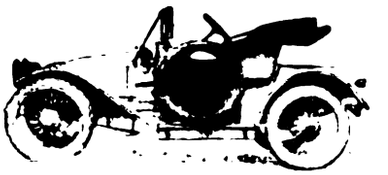
Write for particulars about the Buffalo line and territory.

Model 30—$3200

Its many uses and conveniences recommends it to all as the ideal town car. Speeds from 5 to 25 miles an hour.

Model 30-B—$3300

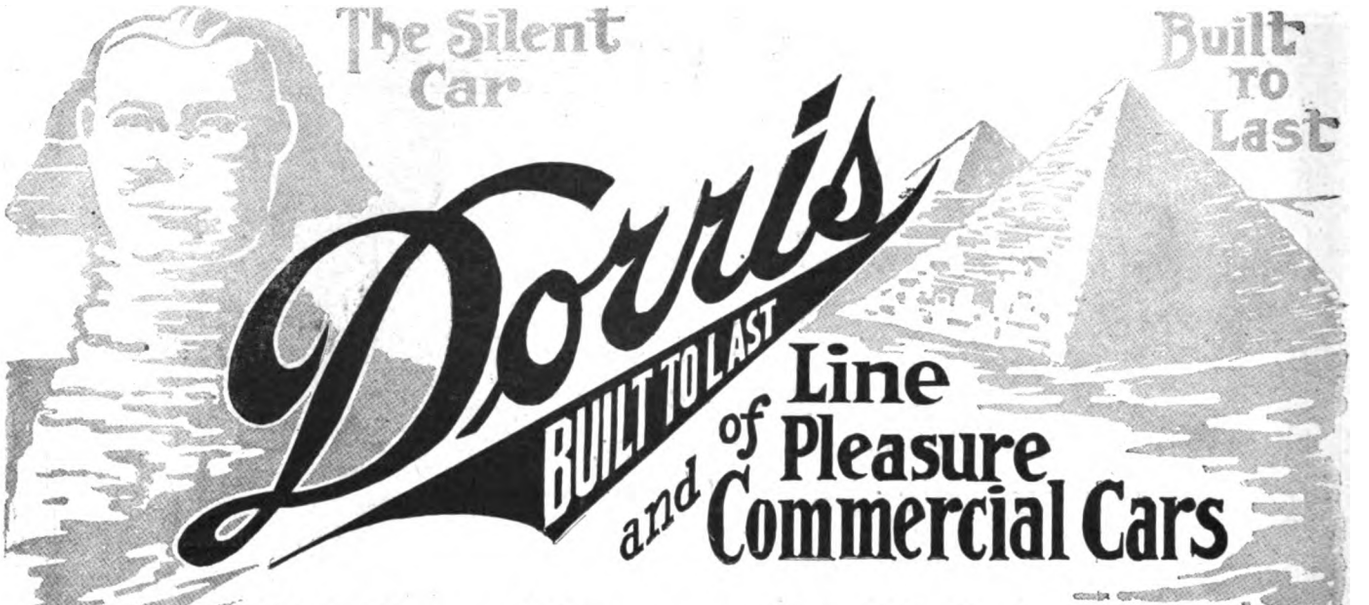
Built upon the same chassis, has more spacious body and all four passengers ride facing forward.



1913 MODELS

Model 29—$2600

For business and professional men. Exceptionally speedy and flexible. Speeds from 5 to 35 miles an hour.



Equipped with wire wheels ($100 extra), the Buffalo Electric presents the same striking appearance that characterizes Continental European motors.

Dorris

BUILT TO LAST

Line of Pleasure and Commercial Cars

Plain Facts of Interest to You, Mr. Dealer

If you are "specializing" on one or two cars, stop it and make YOUR LINE COMPLETE—for the "one car" dealer today is **missing the most of his market.**

He is trying to trim the market to fit his car—to make the people want cars which don't suit their needs or purses and buy cars they don't want.

He is like a haberdasher who would sell only one kind of hat, or a clothier who would sell only serge suits of a certain price. **He Can't Satisfy Very Many of His Prospective Customers,** or build up much of a trade.

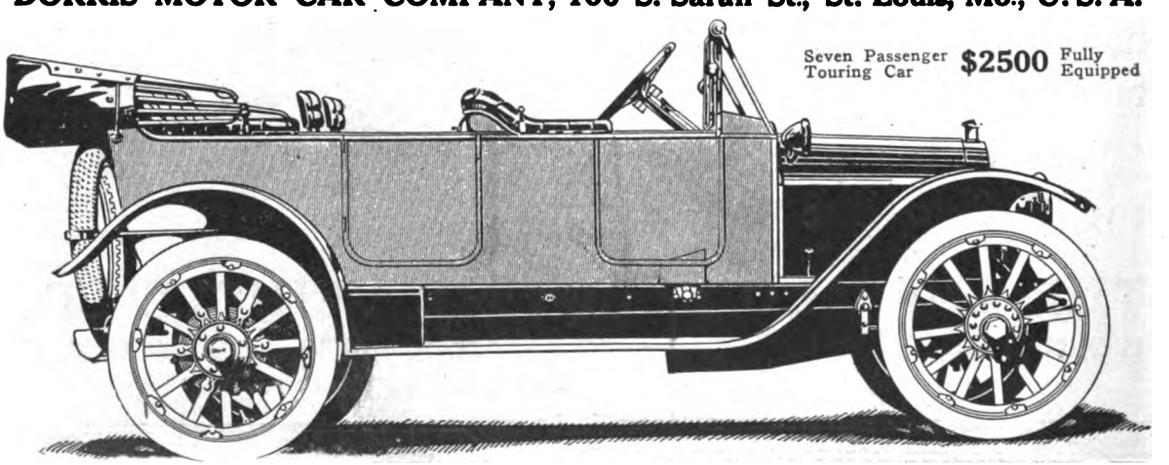
The day of the small, specialized shop is long since past in every kind of business. The **merchant who grows big** carries a FULL LINE. The Wanamakers, Marshall Fields, and Selfridges of today have goods to satisfy **all** the needs of **all classes of buyers.**

Automobile dealers **must** conform to the new conditions. Competition will soon force the one-car man out of the field unless he adds other cars—two, three, four, five or even more—till he has **a full line —a car for every class of buyer.**

PLEASURE CARS
$2500.00 to $3600.00
Electrically Started and Lighted

The Dorris Line
Of Pleasure and Commercial Cars

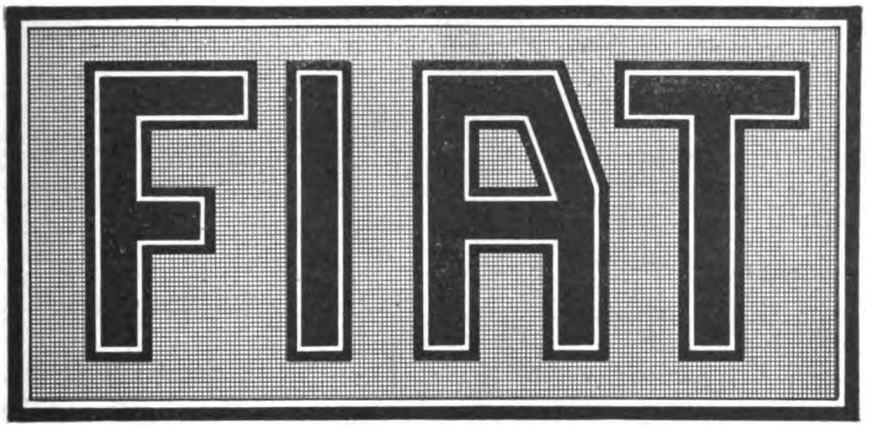
COMMERCIAL CARS
¾ Ton Truck—1½ Ton Truck
$2100.00 to $2500.00



is absolutely essential to every dealer in high-grade cars who wants his line complete. For the Dorris is the greatest middle-priced car built in America—a car of the highest grade selling at a price which attracts the largest number of those desirable buyers who appreciate **REAL MOTOR CAR MERIT** and buy for the value they get.

The Dorris has the class of design, quality of material and workmanship and elegance of finish found in the very highest priced cars. It is luxurious and comfortable under all conditions, with a reserve power equal to the severest emergencies of road and hill.

This car is equally essential to the dealer with high or low priced machines. It presents a happy combination of the very highest quality and a moderate, logical price, which meets the approval of the experienced and most exacting motorist.



We have a proposition which will interest you—write us for full information about it and the specifications of our car.

The Right Foundation for a Motor Truck

Axles—front and rear—form the foundation on which the whole superstructure of the truck depends.

A motor truck is a commercial car and therefore must be dependable.

Dependable axles are fundamentally necessary to the dependable motor truck.

TIMKEN-DETROIT
AXLE EQUIPMENT FOR TRUCKS

In Timken-Detroit design every factor of motor-trucking service is considered—by engineers who have specialized on truck equipment since the days of the first commercial car.

By engineers whose experience covers every phase of truck axle equipment in every kind of a commercial vehicle from light delivery wagon to ten-ton truck.

By men who know what the engineers of a large number of truck builders (Timken-Detroit customers) have discovered in the actual use, first of other equipments, then of Timken Equipment, under every possible condition of truck service.

By engineers who study foreign practice as well as that of our own country.

Built Right, Too

Timken-Detroit Commercial Axle Equipment is built by an efficient organization of men who are specialists in axle production. By men who know every kink in axle manufacture from long experience and study—experience and study that goes back of the automobile age to the horse age.

Men whose heart is in the work—whose sole ideal is building the best possible axles.

Are Standing the Test of Use

Timken ability in designing and integrity in manufacturing commercial truck axle equipment are demonstrated by efficient service under the trucks of an overwhelming majority of the leading truck builders of the country.

The list of truck builders using Timken-Detroit equipment is an unanswerable argument for their quality and serviceability.

Write for a copy of the list—Bulletin 49

The Timken-Detroit Axle Company

Detroit, Michigan, U. S. A.

The only axle manufacturer licensed to make axles equipped with the famous Timken Roller Bearings

JENCICK

This is a crank shaft advertisement although you may look at the illustration and wonder why—just for a moment.

Jencick crank shafts are made from Krupp Chrome Nickel Steel—identical in every chemical and physical feature with the steel used in making the most powerful and durable guns in the world.

When you are studying methods of prolonging the life of the crank shaft—when you are looking for material that will resist the torque depreciation and make crystallization a remote possibility, then study these figures.

KRUPP GUN IN ACTION

STRENGTH OF MATERIALS

We use Krupp Chrome Nickel Steel

Tensile Strength.	Elastic Limit.	In 2" Elongation.	Reduction in Area.	Condition.
135,900 lbs.	114,000	16%	62%	Oil Tempered
110,000 lbs.	95,000	23%	...	Normal
230,000 lbs.	220,000	6%	40%	Case Hardened
Best Machinery Steel Used by Majority Motor Manufacturers				
67,700	34,400	7%	23%	Oil Tempered
55,000	29,700	5%	21%	Normal
74,000	38,900	6%	12%	Case Hardened

We use oil hardened Krupp chrome steel for crank shafts—case hardened for cam shafts, wrist pins, push rods, etc.

We submit that it does not take an ultra-intelligent man to get another chapter on "Jencick quality" from this advertisement—and we are just giving a small part of the story here.

Efficiency and service can never reach the point of satisfying the truck owner if the engine is bought or built on the "keep-down-the-cost-of-production plan."

We want to correspond with quality truck makers who are looking for motors that will make good.

Positive Proof of the Growing Popularity of Underslung Construction

Actual sales gain last fiscal year over preceding year—183 per cent.
Actual sales gain first two months this year over same last year—175 per cent.

Electrically Lighted

AMERICAN UNDERSLUNG

Electrically Started

The "American Traveler" (Type 56A) Fully Equipped $4500

Six passengers. Motor four cylinders, 5 3-8-inch bore, 5 1-2 in. stroke. Wheel base 140 inches; tires 41 x 4 1-2 inch, front and rear demountable rims.

$4500 includes regular equipment as follows: combination electric lighting dynamo and self-starter, all five lamps electric ($350 outfit: $90 Warner clock combination 100 mile speedometer: fine plate glass wind shield; fine mohair top and curtains; high tension magneto and storage battery; two extra rims; shock absorbers; foot rest; robe rail; horn; jack, tools and tire repair outfit.

Country Sport in a Big Powered Car

DRIVING the big, huge-powered "American Traveler" is nothing but sport. The responsiveness of this best of all cross-country cars fills you with exhilaration—makes space seem the veriest kind of a pigmy. The "Traveler" is peerless mechanically, but—more than any other of the famous high-grade cars, it is the one for the great open country. Its wonderful power, speed and riding comfort make it so. There is none of that just-for-town atmosphere about the "Traveler."

You can sweep over the biggest hills on "high." Down country lanes you can rush sixty—seventy miles an hour without discomfort to your companions in the tonneau. There is no sidesway. If you like you can loaf along almost noiselessly at four or five miles an hour without "shifting" gears. The "Traveler" is just filled with delight—always obedient.

The "Traveler" is built on the famous "American Underslung" principle, which makes possible additional safety, economy and comfort.

The low center of gravity means *safety* and *added comfort.*

The Straight line drive means *less wasted power.*

The larger wheels mean *easier riding, tire economy* and *maximum road clearance.*

The "American Underslung" frame permits the direct and practical introduction of all these distinct and exclusive advantages.

The "Traveler" is priced at $4500, and comes fully equipped. All of this equipment is listed above. The accessories and the very finest we can procure.

The "Traveler" production is necessarily limited, due to the time demanded by each perfected chassis. Individuals or dealers should wire us at once for fall reservations.

American Motors Company, Dept. E, Indianapolis, Ind.

PREST-O-LITE
The Light Universal

Remember This, Whenever You Exchange Your Empty

Prest-O-Lite Gas Tank

If you saw someone trying to steal your Prest-O-Lite Tank, you'd interfere, wouldn't you?

Well, any one who takes off your genuine Prest-O-Lite Tank, and slips on a counterfeit in exchange for it, is taking your property while your back is turned.

Your Prest-O-Lite Tank is in use and demand everywhere and can be exchanged, when empty, ANYWHERE and ALWAYS.

An imitation tank can be exchanged in mighty few places, and therefore has only a very limited value.

Any tank that has poor exchange service, some day may have none at all.

Dozens of imitators of Prest-O-Lite have gone out of business, leaving a trail of tanks that could neither be sold nor re-filled.

So it behooves you to watch, when you turn in your empty tank, and see that you get a genuine Prest-O-Lite Tank in return for it.

And another thing—we cannot assume responsibility for short measure or poor gas in tanks not filled by us. Protect yourself by looking for our label.

The Prest-O-Lite Co. 287 East South St. Indianapolis, Indiana

Branch offices and Service Stations in all principal cities. Charging Plants in all parts of the country. Extensive foreign service.

EXCHANGE AGENCIES EVERYWHERE

Another Feature That Contributes to the *Permanent* Accuracy of the

CORBIN-BROWN SPEEDOMETER

"the speedometer of *permanent* accuracy"

It is an unquestioned fact that the construction of the flexible shafting is responsible for much of the inaccuracy and unreliability of speedometers in general.

Too much friction in the casing results—or friction is minimized at the cost of durability.

The Corbin-Brown flexible shafting overcomes these faults.

It consists of a succession of eye-links and solid links, as shown in the illustration.

The solid link gives a smooth bearing, thus minimizing friction and insuring smooth running.

The strength of these links makes breaking almost impossible. However, if perchance one should break, the replacing with a new link is so simple a matter that anyone can do it.

Warner Quality
Steering Gears

ANYBODY can claim quality—but a record of eight years use on the better class of cars is indisputable proof. That proof is back of Warner Steering Gears.

The prime features of Warner Gears are: accessibility; complete interchangeability; use of eccentric sleeves; adjustable angle of column; large bearing and contact surfaces specially hardened and ground, assuring ease of motion and durability.

The Warner line includes a wide range in both pleasure and commercial types.

We guarantee dependable deliveries.

Get acquainted with Warner Quality—make it another selling argument.

We modify our designs to meet your detail requirements, or build on approved designs on seasons quantity specifications.

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Wire or write us, no matter where you are.

Our PRICES compete with LEADING AMERICAN makes.

BENZ AUTO IMPORT COMPANY OF AMERICA
250 West 54th Street New York, N. Y.
Direct Branch of Benz & Cie., Mannheim, Germany.

Remy Magneto

Exchange Your Old Magneto for a New Remy

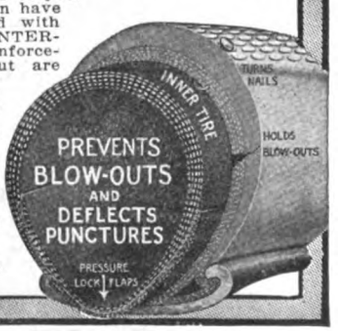
INTERLOCK INNER TIRES
Stop Tire Troubles

INVESTIGATE AND LEARN WHY SO MANY THOUSANDS OF MOTORISTS ARE DISCARDING INNER SHOES, RELINERS, FILLERS, AND OTHER MAKESHIFTS FOR INTERLOCK INNER TIRES—AND WHY INTERLOCKS ARE HANDLED AND RECOMMENDED BY THE BEST SUPPLY DEALERS AND TIRE HOUSES ALL OVER THE COUNTRY.

One weak point of the automobile to-day is that you can't depend on its tires. INTERLOCKS revolutionize this condition by making your tires so strong that blowouts become practically impossible. INTERLOCKS save half your tire expense—save repair bills—double your mileage—prevent punctures and completely free you from all fear of tire trouble.

What INTERLOCKS Are.—The INTERLOCK is a complete inner tire (not an inner shoe) which is placed between the outer casing and the inner tube to strengthen the outer casing and protect the tube. It is the only reinforcement which is locked by air pressure to the rim and which becomes an integral part of the tires, and, therefore, cannot heat or chafe. Even if the tire is broken the INTERLOCK will hold.



INTERLOCKS Insure Safety.—You know that the sudden blowing out of a tire may easily ditch any car when going at fair speed—the safety of INTERLOCKS should appeal to you.

Reduce Your Tire Expense.—You can have the tires on your new car equipped with INTERLOCKS if you specify them. INTERLOCKS are the only perfect tire reinforcement. They cost a little more but are cheapest in the long run.

For your present car—ask any dealer or supply house, or write to us for the name of your nearest supply source. INTERLOCKS will make any fairly sound tire more than carry you through the season. They are easily placed and are made in all sizes.

We Want Dealers Everywhere.—Write for Special 30 Day Offer, Booklets, Prices, Records of Road Tests and Testimonials of users.

To Manufacturers of Motor Cars:

Have you considered the important advantages of using the American made New Departure ball bearings in your new models?

It is a significant fact that most manufacturers of motor cars have done so and after testing them out, have contracted with us for their requirements.

Take a short cut to a quick discussion of your bearing problems by sending us your blue prints and data. You will receive by return mail our catalogue-treatise, written by our staff of engineers. This will be followed quickly by a letter from our chief engineer frankly stating the result of his study of your bearing requirements, with a view to securing maximum efficiency at minimum installation and maintenance cost.

Write today. It will save your time and expensive experimenting.

Weed Chains
The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires
Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

MERCER

"As to the Mercer, it can be said that considering its size it made the most wonderful showing ever displayed in a Vanderbilt Cup Race."— *The Automobile*, Oct. 3, 1912.

A 301 cubic inch Mercer car finished second in Vanderbilt Cup Race—299.5 miles—at Milwaukee, Wis., October 2, 1912, only 40 seconds behind winning Mercedes—a 600 cubic inch speed creation, conceded to be Europe's best.

An average speed of 69 miles an hour was maintained, over one of the roughest courses ever used for racing.

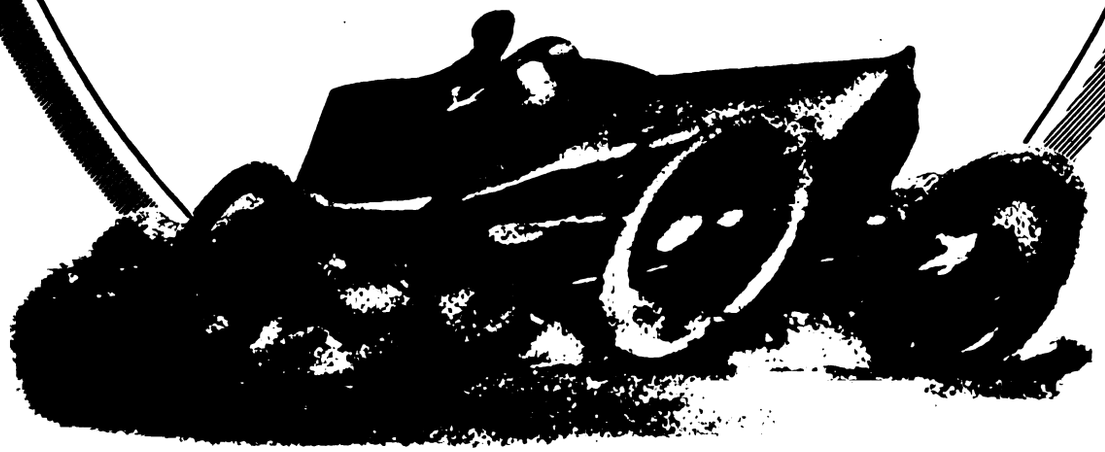
The quotation from **The Automobile** is but one of the many tributes to the remarkable power, speed and consistency shown by the Mercer.

OTHER IMPORTANT 1912 MERCER WINNINGS INCLUDE

May 4—First in 151.5 mile Jepsen Trophy Race, Santa Monica, Cal.

May 30—Third in 500 mile International Sweepstakes, Indianapolis, Ind. Average speed, 76.3 miles per hour.

July 5—First in 150 mile medium car race, at Tacoma, Wash.



August 25—Won 200 mile track race Columbus, O. Broke all mile track records from 75 to 200 miles.

August 30—First and second in 152-mile Aurora Trophy Contest at Elgin, Ill.

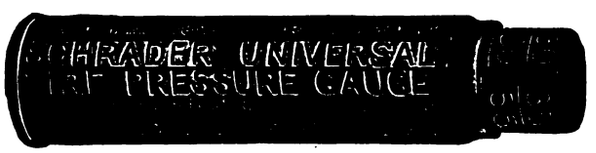
Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure



He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

Price $1.00 Each
Ready for Delivery Now

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers and the dealers, or

1913 KLINE KAR

The Car of Quality

The Kline Kar roadster for Series A, 1913, is the classiest and best small car proposition made this season.

This car, mounted on 4-30, 4-40, 6-50 and 6-60 chassis, is the ideal automobile for all kinds of service. It is especially adapted to the needs of a physician.

The Honeymoon Car

Thus it is known in the factory, for the machine—a two-passenger type—fills all requirements for the wedding trip.

The big, roomy luggage compartment, shown in the photograph, will carry three large suitcases, hat box and other touring necessities.

The machine is THE easiest riding runabout or roadster sold. The upholstering and spring suspension are perfect.

¶ "Comparisons are odious," we have been taught to believe, but the automobile industry has upset this and other traditions heretofore accepted as gospel. "Comparisons furnish excellent proof of worth" might well be substituted, for everyone wants the most his money will buy and comparisons or actual demonstrations are the best known methods for finding what is best.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, October 17, 1912 No. 4

PURCHASER FINALLY FOUND FOR ATLAS ENGINE WORKS

The Lyonses of Chicago Form $500,000 Company and Make Acceptable Bid for Property—Awaits Approval of Court.

After remaining in suspense for more than three months, the Atlas Engine Works of Indianapolis have been saved, and so soon as released by the receiver they will return to the manufacturer of gas engines, including the Knight and Diesel type. The "saviors" are James W., William P. and Geo. W. Lyons, all of whom are Chicagoans and the first two of whom were identified with the Atlas Engine Works some 15 or 20 years ago. It is understood that several wealthy men whose names will not appear are associated with the Lyonses in the venture.

When the property apparently was going begging they submitted a bid, and on Tuesday last Judge Weir in the Federal Court in Indianapolis ordered the plant sold, and there is small doubt that he will approve the tender made by the Lyons people. As evidence of the understanding that exists, the Lyonses already have incorporated the Lyons-Atlas Engine Works, which, capitalized at $500,000, has been incorporated under the laws of Indiana. James W. Lyons is its president, William P. Lyons its vice-president and George W. Lyons its secretary and treasurer.

Under the provisions of the bid, the new company will pay $441,000, the interest on the $1,050,000 worth of bonds, secured by a mortgage deed of trust held by the Indiana Trust Co.; also the sum of $105,000, a certain indebtedness secured by $150,000 worth of bonds; also $48,187.04, a debt which is secured by $63,000 worth of bills and accounts receivable, and $80,000 in cash. Two judgments against the Atlas Engine Works, aggregating $6,700, also will be paid.

The company will take over the real estate and buildings of the Atlas Engine Works subject to the mortgage deed of trust, but the personal property of the company must be sold free of any incumbrance.

Willys-Gramm Suit Amicably Settled.

The action instituted in August last by John N. Willys, president of the Willys-Overland Co., against A. L. White and W. T. Agerter, former president and treasurer, respectively, of the Gramm Motor Truck Co., of Lima, O., has been settled amicably. In his complaint, which proved something of a sensation, Willys charged that previous to his purchase of the Gramm company, in April last, White and Agerter had authorized the issue of 1,000 shares of stock to cover a fictitious indebtedness, and declared a stock dividend of $225,000 when the Gramm company really had no surplus capital, and otherwise practised fraud and misrepresentation, in view of which Willys asked the court to annul his contract of purchase. The amicable adjustment, it is understood, was brought about by a readjustment of values so satisfactory to Willys that the suit will be withdrawn.

Continental Cuts Luscious "Melon."

It required even less than half an eye to discern that the Continental Motor Mfg. Co., of Detroit and Muskegon, Mich., had enjoyed unbounded prosperity, but, despite the fact, trade-wise persons were unprepared for the declaration of the 200 per cent. stock dividend which was voted by the directors at the annual meeting of the company last week. At the same time, the capital of the company was increased from $500,000 to $2,400,000, of which $900,000 will be retained in the treasury to meet future necessities.

MAXI CARBURETTER BOUGHT BY WALL STREET BANKERS

Nevins and Dunn Purchase Controlling Interest from the McCoys—Factory Acquired in Newark and Already is Operating.

Because the manufacture of carburetters does not readily dovetail with the production of gas lighting fixtures and artistic bronze work, Edward A. McCoy and his intimates, who organized the Maxi Co. to manufacture the carburetter of that name, have disposed of a 75 per cent. interest in the company to Thomas A. Nevins and John W. Dunn, of New York City. The new owners already have acquired a factory in Newark, N. J., and are prosecuting the manufacture of the Maxi carburetter with such energy that it is probable that it will be ready for the market within 30 days.

The Maxi Co., capitalized at $200,000, was incorporated under New York laws in July last, the reputation of the McCoys in their original field of manufacture—that of gas lighting fixtures and bronze work—giving to the new enterprise immediate standing quite apart from that contributed by the originality of the carburetter itself.

Edward A. McCoy is president and treasurer of the company, but with the other officers will retire so soon as Messrs. Nevins and Dunn are ready to take office. It is probable that Nevins will assume the presidency and Dunn become secretary and treasurer. Both of these gentlemen are bankers, located at 41 Wall street, New York, and are men of means and large experience. Nevins is the head of the Hydrocarbon Convertor Co., which had to do with a kerosene carburetter, while Dunn is the former president of the International Steam Pump Co., an enterprise the magni-

Digitized by Google

tude of which is aptly suggested by its title.

The carburetter will be produced under patent No. 1,038,040, issued September 10, 1912, to Arthur J. Weiss, West Orange, N. J., and assigned to the Maxi company. It is distinguished by an entire absence of springs and by the fact that, although there are no less than 14 fuel outlet passages, it requires absolutely no adjustment. The single butterfly throttle valve which is employed is so mounted that, as it opens, it successively opens 13 of the fuel jets; the 14th protrudes through the butterfly valve and is of peculiar design, so that through it both the air and the gasolene necessary for starting the motor or for operation at low speed are supplied.

To Produce New Type of Rim.

To exploit a new type of quick detachable, demountable rim patented by Robert W. Ashley, a New York patent attorney, the General Rim Co., capitalized at $150,000, has been incorporated under the laws of New York and will at once proceed to place the new product upon the market. The company will not equip factories and build its own products, but will have them manufactured in the plants of the Mott Wheel Works in Utica, N. Y., and Jackson, Mich. Offices of the company have been opened at Broadway and 64th street, New York.

In the company Ashley, who is not new in the field of invention, is vice-president and secretary. The president is Frank Oberkirch, of 47 West 34th street, New York City, who also is president of the St. Mary's Sewer Pipe Co., of St. Mary's, Elk county, Pa. The treasurer is William Kaul of St. Mary's, a manufacturer and broker who is identified with various enterprises.

Ashley's invention consists essentially of a floating split ring which lies within the rim of the wheel and which is attached at the ends to a simple locking device that works with a nut and bolt. The expansion of the ring forces it outward and into a slot in the rim bed, locking it tightly in place. Ashley states that removing a rim with this device is a matter of seconds only.

Yonkers Repairman Sued for Tire Bill.

Because of the alleged failure of Herman Flador, trading as the Yonkers (N. Y.) Auto Repair Co., to pay all of a bill of $1,645.02, the Shawmut Tire Co. of New York is prosecuting an action in the Supreme Court for New York county. The complaint is that between May 11 and August 7, 1911, Flador bought goods to the amount of $1,645.02 and paid but $1,046.46, leaving a balance of $598.56. The goods were sold by the Shawmut Tire Co., of Boston, but the account has been assigned to the Shawmut Tire Co. of New York, in which name the proceedings are brought.

REORGANIZE KELLY TRUCK AND TRIPLE PRODUCTION

Capital Increased $2,500,000 But Control Remains With Kellys—Air-Cooled Motor Is Dropped—Shanks Is Sales Manager.

In order to permit of enlargement, and to carry out more aggressive plans which have been mapped out, the Kelly Motor Truck Co., of Springfield, O., capitalized at $450,000, has been reorganized, under the laws of that state, under the style Kelly-Springfield Motor Truck Co. The new company is capitalized at $2,500,000, of which $1,000,000 is preferred stock and the remainder common.

In the reorganization and refinancing of the company, Emerson McMillin & Co., who are bankers and brokers in New York, have played a leading part and, who, as required by the laws of Ohio, have subscribed for at least 10 per cent. of the stock. The control of the company, however, will remain with E. S. Kelly, who is general manager, and J. S. Crowell, who is vice-president and secretary, and who will receive new stock in exchange for their holdings in the old company. Officers of the new company have not yet been elected, but the Kellys will remain in full charge.

It is the intention immediately so to enlarge the factory as to permit of tripled output and to abandon the air-cooled motor, which long has been a feature of the Kelly vehicles, and use instead a water-cooled engine.

Among other outgrowths of reorganization will be the appointment of Charles B. Shanks as sales manager of the Kelly-Springfield company, who is at present its western manager with headquarters in San Francisco. Early in November he will remove to the factory in Springfield to assume his new and larger duties.

Shanks was the original sales manager of the Winton Motor Carriage Co., of Cleveland, which implies that he is one of the veterans of the industry. After removal to the Pacific Coast he became interested in commercial vehicles, to which he since has devoted himself.

New Yorkers to Market the Gasosava.

The Gasosava Co., organized under New York laws with $50,000 capital stock, has taken over the "Gasometer" introduced several months since by the Lattig & Townsend Co. of Philadelphia. John J. Smart is president of the Gasosava Co., Eugene Cable treasurer and George T. Keen secretary; all of them are New York hotel men. The device is being manufactured in Torrington, Conn., but the Gasosava offices are in New York, at 1270 Broadway. In its simplest aspect, it is merely a fine brass screen the edges of which are bound in a copper gasket. The outer part of the circular area of the device is covered by a porous fabric wick calculated to operate on the principle of the wick in a carburetter. The contrivance is designed to be inserted between the carburetter and the intake manifold and its purpose is to ensure the homogeneity of the mixture and to save "gas," as the name suggests.

Atlas and "35%" Settle Their Suit.

Despite the fact that some of those who made contracts to exchange goods for advertising in a so-called monthly bulletin issued by the 35% Automobile Supply Co. of New York, and who later failed to carry out the terms of the contract, believing they had been duped, propose to fight to a finish in the courts, settlement was this week made in the action brought by the 35% concern against the Atlas Rubber Co. of Buffalo, in the Supreme Court for New York county. The complaint was that, in exchange for the advertising the Atlas company was to credit the "35 percenters" with $3,360 worth of goods but defaulted when $1,900 was still due. The Atlas company claimed it had transferred the contract to the J. Elwood Lee Co. and had no further interest in the matter. It is stated by the 35% representatives that the Lee company made the settlement.

Virginians Follow Sultan to New York.

Having obtained a judgment in Richmond, Va., against the Sultan Motor Co., of New York City, the Virginia Taxi Service Co. this week concluded an action in the Supreme Court for New York county and had the judgment with added interest and costs recorded in New York, thus obtaining jurisdiction over the motor company. The amount now is $21,163.39 and comprises a claim made by the Richmond concern that cabs furnished by the Sultan company were not according to contract and therefore caused considerable damage to the plaintiff's business. The judgment in Richmond was taken in July last.

N.A.A.M. to Hold Session in Detroit.

For the first time, the National Association of Automobile Manufacturers is to hold a meeting in the "automobile capital"—Detroit, Mich.—a general meeting of the organization having been fixed to occur in that city on the 13th, 14th and 15th of November. The session, however, will in no way interfere with the regular meeting of the executive committee, which will occur in New York, as usual, on the first Wednesday in the month.

INVENTOR SALVINI'S HORN CAUSES STORM OF TROUBLE

Tries To Manufacture It, But Incorporation Mix-up Leads to Court—First Move Results in a Salvini Victory.

An electric horn, which is not yet patented, a proposed corporation which never incorporated and a corporation which did incorporate all figure prominently in an action which Mrs. Minnie Cohen of New York City, wife of a clothing manufacturer, has brought against the Salvini Electrical Horn Manufacturing Co., also of New York, in the Supreme Court for New York county. Mrs. Cohen, for various and divers reasons, asked that pending the litigation an injunction be issued restraining Salvatore Salvini and his company from manufacturing and selling the horn. Judge Greenbaum, however, made decision on a novel legal point and refused the injunction on the grounds that a three party contract, which has been signed by two only, is not binding between the two who have signed. Further action, however, is probable.

Salvini, who in the legal papers also is named as Salvatore Scognamillo, previous to conceiving the idea of the horn, had invented one or two things but claims to have lost out when it came to getting anything substantial through the promotion of the devices. When he invented the horn he sought friends upon whom he thought he could depend and asked capital wherewith to manufacture the horn, he having made application for a patent April 16 of the present year. Mrs. Cohen agreed to subscribe funds for floating the project and, according to her complaint, the articles of incorporation were drawn up the first week in September. Mrs. Cohen, Salvini, and Edwin Solomon, one of Cohen's salesmen, were to compose the company, but after she and Salvini had signed, she refused to go further or to put up any money until the proposed patent had been subjected to a search to give some idea of its validity and also to ascertain if infringement suits would be likely.

Mrs. Cohen claimed that instead of waiting for the conclusion of the search Salvini and Solomon, with Solomon's brother Godfrey, incorporated the Salvini Electrical Horn Manufacturing Co., began to fit up a factory on East 136th street, New York City, and prepared to manufacture. She laid claim to an interest in the invention because of the fact that she and Salvini had signed the original articles for the first proposed incorporation. On this basis she sought an injunction restraining Salvini and the company from manufacturing, which, as stated, Judge Greenbaum refused.

The horn is said to operate on the familiar plan of a cam device causing a succession of blows on a metal diaphragm, the moving parts being electrically operated. In appearance it strongly suggests one of the well known horns now on the market.

General Vehicle Rearranges its Staff.

To succeed R. McA. Lloyd, who recently resigned to join the International Motor Co., G. W. Wesley has been elected vice-president of the General Vehicle Co., of Long Island City, N. Y., whose plans for the manufacture of gasolene commercial vehicles, under the Daimler patents, in addition to the familiar G. V. electrics, now are well advanced. H. G. McComb has been appointed engineer of the gasoiene division and J. R. C. Armstrong engineer of the electric division, of which L. E. Lentz will be superintendent. C. W. Squires, Jr., who formerly was assistant to President Wagoner, has been promoted to the sales management of the big company. Irwin W. Howell succeeds Squires as assistant to the president.

Sturdy Purchases Sta-rite Spark Plugs.

The Sturdy Mfg. Co., of Chicago, makers of the spark plug of that name, has purchased the assets of the R. E. Hardy Co., of Chicago, which was thrown into bankruptcy in August last, and will continue the line of Sta-Rite plugs previously manufactured by the Hardy people. They comprise the Sta-Rite Vulcan plug, which is of the double porcelain type; the Venus, a mica plug, and the Gotham, a single porcelain plug. The Sturdy company also will go very largely into the manufacture of special brand spark plugs for the 1913 season.

Elmore Plant Purchased by Krebs.

The manufacture of the Elmore two-cycle car having been discontinued by the General Motors Co., the Elmore Plant in Clyde, O., has been purchased by the Krebs Motor Car Co. of that city, which is largely in the nature of the property reverting to its original owners. B. A. Becker, president of the Krebs company, Krebs himself and nearly all others identified with that truck producing enterprise previously were identified with the Elmore company.

McGraw Declares 60 per cent. Dividend.

Having prospered during the past year, the directors of the McGraw Tire & Rubber Co., of East Palestine, O., at their annual meeting last week, declared a stock dividend of 50 per cent. in addition to a cash dividend of 10 per cent. This action followed the increase of the capitalization of the company from $100,000 to $250,000.

OTHO ELECTRIC SYSTEM TO BE MANUFACTURED BY DEAN

Maker of Tuto Horn Secures Exclusive Rights to New Lighter and Starter—Device is of Self-Regulating Flywheel Type.

It is not often that a brand new device quickly is taken up by a reputable and old-established manufacturer, but that distinction has fallen to the Otho electric lighting and starting system, which but a few weeks since was introduced to the trade by the Otho Motor Co., of Boston, Mass. Apparently it immediately attracted the favorable attention of the Dean Electric Co., of Elyria, O., makers of the Tuto horn and other electrical devices, and as a result of negotiations which were entered into the Dean company has acquired the exclusive manufacturing rights to the Otho system and at once will produce the device in large quantities.

The system is of the type in which a single motor-generator unit serves both to furnish current for the complete equipment of lights and to start the engine, the unit being alternately generator or motor, according to whether the engine is running or the device is being used to start the engine. It differs from the majority of other such systems, however, in that the motor-generator unit is designed to take the place of the flywheel, which, of course, eliminates all gearing. A further difference between the Otho and other systems is that in the Otho there are no rotating wires or brushes; the field pieces and the commutator are the only parts which rotate, all of the winding and the brushes being stationary.

Willard Acquires a Third Factory.

Although the two plants which it now is operating fulfill its immediate requirements, the Willard Storage Battery Co., of Cleveland, has taken time by the forelock and has purchased the site and three-story brick and stone building on Lakeside avenue in that city previously occupied by the Frost Wire Fence Co. It will be styled plant No. 3. It will afford an additional 50,000 square feet of floor space and is admirably adapted to the Willard use, both on account of its arrangement and its close proximity to the Willard No. 1 plant. Like the other two plants, it will be equipped to duplicate in every separate detail the LBA storage battery, thus assuring not only ample room for the increased output which is in sight but guaranteeing that there will be absolutely no interruption of production should fire or other disaster affect the Willard operations.

FIVE YEAR VOTING TRUST FOR UNITED STATES MOTOR

Official Plan of Reorganization Provides for It—Capital Reduced to $31,000,000—How Plans Will Be Carried Out.

Official announcement of the formal plan of the reorganization of the United States Motor Co. was made public late last evening, but save for the fact that it provides for the issue of voting trust certificates, representing both first and second preferred stock and the common stock, all of which are to be deposited for a period of five years with a voting trust consisting of three men, the plan does not differ substantially from that which was foreshadowed by the report of the creditors' committee, the salient points of which were printed in last week's Motor World.

The reorganized company will be capitalized at $31,000,000, instead of $42,500,000, as in the case of the company which went into the hands of receivers on September 11th last, the capitalization being divided as follows: $11,000,000 7 per cent. first preferred cumulative stock, $9,000,000 second preferred and $11,000,000 common stock. It is understood that the reorganization will carry with it considerable change in the official make-up of the company, but at last accounts the man who will become its head and direct its affairs has not yet been chosen.

As was stated by Motor World last week, an assessment of $24 per share will be levied on all the outstanding stock of both the United States Motor and Columbia Motor Car Co., which is one of its subsidiaries but whose stock is separately held, which assessment will provide $5,720,996 in cash, which, with $1,009,091, the amount in the treasury of the big corporation when it failed last month, will afford quick capital of $6,730,087, out of which the merchandise and banking creditors will be paid 25 per cent. in cash. The remainder, which is about $3,000,000, will be available for working capital.

In addition to their 25 per cent. these creditors will receive 25 per cent. first preferred, 25 per cent. in second preferred and 15 per cent. common, a total of 90 per cent. The holders of preferred stock will receive 24 per cent. in first preferred shares, 25 per cent. second preferred and 30 per cent. common, a total of 77 per cent. Holders of common stock will receive 24 per cent. in first preferred, 17½ per cent. second preferred and 30 per cent. common, a total of 71½ per cent. The holders of the $6,161,000 debentures will receive 50 per cent in first preferred, 50 per cent. in second preferred and 40 per cent. in common, a total of 140 per cent.

Voting trust certificates representing first preferred stock are intended to be distributed to creditors and stockholders participating in the plan substantially as follows:

To depositing holders of debenture bonds and bond scrip (50%)	$3,080,755
To depositing holders of claims against the Motor Company only (25%)	475,906
To depositing stockholders of the Motor Company and of the Columbia Company duly paying the assessments hereinafter provided for:	
Preferred stockholders (24%)	2,763,152
Common stockholders (24%)	2,957,844
Total	$9,277,657

The second preferred stock shall be subject to the rights and privileges of the holders of the first preferred stock. No dividends shall be paid upon or set apart for the second preferred stock in any fiscal year unless and until full dividends at the rate of 7 per cent. per annum upon the first preferred stock for all previous years subsequent to January 1, 1913, shall have been declared and paid, nor unless and until full dividends at the rate of 7 per cent. per annum upon the first preferred stock for the current fiscal year shall have been declared and paid or provided for by a fund set apart for the payment thereof.

Voting trust certificates representing second preferred stock are intended to be distributed to creditors and stockholders participating in the plan substantially as follows:

To depositing holders of debenture bonds and bond scrip (50%)	$3,080,755
To depositing holders of claims against Motor Company only (25%)	475,906
To depositing stockholders of the Motor Company and of the Columbia Company duly paying the assessments hereinafter provided for:	
Preferred stockholders (25%)	2,878,283
Common Stockholders (17½%)	2,156,761
Total	$8,591,705

Voting trust certificates representing common stock are intended to be distributed to creditors and stockholders participating in the plan substantially as follows:

To depositing holders of debenture bonds and bond scrip (40½)	$2,464,604
To depositing holders of claims against Motor Company only (15%)	285,543
To depositing stockholders of the Motor Company and of the Columbia Company duly paying the assessments hereinafter provided for:	
Preferred stockholders (30%)	3,453,940
Common stockholders (30%)	3,697,305
Total	$9,901,392

To the extent necessary to make distribution of voting trust certificates to holders of such of the notes of the United States Motor Co. endorsed by one or more of the subsidiary companies as shall not be paid in full under the plan, the capitalization of the new company may be increased. In case none of these notes shall be established or admitted as claims against one or more of the subsidiary companies, it is intended that there shall be distributed to the holders of such notes participating in the plan 25 per cent. thereof in cash and voting trust certificates representing first preferred stock 25 per cent. of the par value of $169,995, representing second preferred stock 25 per cent. of the par value of $169,995, and representing common stock 15 per cent of the par value of $101,997, and that the authorized capital stock of the new company shall be increased by said amounts; in such event there will be added to the cash provided by the reorganization 75 per cent. of the amount of such claims, namely, $509,985.

All first and second preferred stock of the new company and all common stock other than shares reserved to qualify directors shall be vested for a term of five years in Charles H. Sabin, Harry Bronner and James C. Brady, and their successors as voting trustees, and voting trust certificates in such form as may be determined by the committee will be distributed in lieu of stock.

Chicago Contributes Triplex Gas Saver.

Fred G. Bremer, former manager of the Twitchell Gauge Co., of Chicago, and I. N. Wilson, president of the Fowler-Carnes Co., of Aurora, Ill., have formed the Bremer-Wilson Mfg. Co., with offices at 1256 Michigan avenue, Chicago, to manufacture and market the Triplex gas saver and, later, several other automobile accessories.

Bremer is an automobile engineer of wide experience. His first connection was with the Bremer Machine & Tool Co., of Kalamazoo, Mich. He later served with the Pope, American Mercedes, Midland and United States Motor companies. As the name of the Triplex gas saver implies, it is a device designed to break up such globules of liquid fuel as may have passed through the carburetter without perfect admixture with the air content, or, in other words, to make the mixture homogeneous. In form, it is a heavy copper gasket enclosing a fine screen, and is intended for insertion in the intake passage, preferably close to the carburetter.

Slight Falling off of Car Imports.

Although 66 cars, valued at $155,227, were imported into the United States during the month of August, the total for the first eight months of the year shows a falling off of 10 per cent. in number and 6 per cent. in value. Up to the end of August, 1912, the imports were 532 cars, valued at $1,237,528, as against 608 cars, valued at $1,312,969, during the corresponding period of the previous year. The record in detail is as follows:

	August.		1st 8 Months.	
	No.	Value.	No.	Value.
France	33	$82,639	285	$699,881
Germany	3	5,705	39	92,854
Italy	5	10,899	51	85,864
United Kingdom	13	31,684	101	240,870
Other Countries	12	24,300	57	118,059
Total	66	$155,227	533	$1,237,528

The Week's Incorporations

Los Angeles, Cal.—F. & K. Auto Co., under California laws, with $25,000 capital; to deal in motor cars. Corporators—T. F. Felt, W. B. Kerrick, Mary Felt.

Rochester, N. Y. — Fordham Co., under New York laws, with $3,000 capital; to deal in motor cars. Corporators—Gerald F. Fox, Eugene A. Reinke, Richard Stanton.

Detroit, Mich.—Detroit Standard Gear Co., under Michigan laws, with $50,000 capital; to manufacture gears. Corporators—D. M. Ireland, M. E. Smith, L. E. Straw.

Waterbury, Conn. — Taxi Service Co., under Connecticut laws, with $10,000 capital; to operate a taxicab service. Corporators—Charles B. Schoennahl, Michael W. Norton, Arthur A. Page.

Los Angeles, Cal.—Angelus Motor Truck & Transfer Co., under California laws, with $250,000 capital; to operate a motor delivery. Corporators—J. F. Clarke, L. W. Van Horne, and others.

Hopkinsville, Ky.—Hopkinsville-Cadillac Automobile Co., under Kentucky laws, with $10,000 capital; to deal in motor cars. Corporators—R. E. Cooper, T. W. Blakey, Odie Davis, Richard Levell, E. G. Peterson.

New York, N. Y.—Never Skid Mfg. Co., under New York laws, with $50,000 capital; to manufacture motor car devices. Corporators—Daniel E. Wing, George L. Lewis, Charles H, Staunton, all of 42 Broadway.

Indianapolis, Ind.—Glover Equipment Co., under Indiana laws, with $20,000 capital; to manufacture motor car accessories. Corporators—Frank L. Glover, Leonard Geiger, William A. Umphrey, Louis A. Libkings.

Salt Lake City, Utah.—Utah Automobile Livery & Taxicab Co., under Utah laws, with $50,000 capital; to operate a motor livery and taxicab service. Corporators—Abe Meeking, Jr., Charles A. Gillette, Frank J. Gustin.

Kingston, N. Y.—Taxicab Transportation Co., under New York laws, with $5,000 capital; to operate a taxicab service. Corporators—William Hilterbrant, Elizabeth K. Hilterbrant, Elsie Hilterbrant, all of Presidents' place.

Los Angeles, Cal.—American Tractor Co., under California laws, with $50,000 capital; to manufacture tractors. Corporators—Henry T. Boynton, Donci E. Newcomb, Co., under New Jersey laws, with $50,000 Russell Sears.

New York, N. Y.—Zilio Sales Co., under New York laws, with $5,000 capital; to deal in tire filler. Corporators—Edward Mayse, 300 Central Park West; Felix H. Mayse, Broadway and 98th street; Isaac J. Phelps, 305 Fifth avenue.

New York, N. Y.—Commercial Delivery Co., under New York laws, with $500 capital; to deal in commercial vehicles. Corporators—Abraham Miller, 1359 Third avenue; Nathan Tarakan, Louis Tarakan, both of 80 East 115th street.

Brooklyn, N. Y.—Mears Motor Vehicle Co., under New York laws, with $600 capital. Corporators—J. W. Mears, 139 Ocean parkway, Brooklyn; E. A. Kellam, Fort Hamilton avenue, Brooklyn; C. Mears, 136 East Fourth street, Brooklyn.

New York, N. Y.—United Tire Sales Co., under New York laws, with $500 capital; to deal in motor car tires. Corporators—A. G. Thaanum, 13-21 Park Row; Joseph T. Weed, 150 Hicks street, Brooklyn; Max Greenberg, 32 West 112th street.

New York, N. Y.—Used Car Company of New York, Inc., under New York laws, with $5,000 capital; to deal in motor cars. Corporators—Andrew F. McNamara, 220

FISK TIRE OFFICERS AND SALESMEN ASSEMBLED AT CHICOPEE FALLS

Broadway; Gustavo Galiani, 57 Chambers street; Jacob J. Kramer, 220 Broadway.

White Plains, N. Y.—General Rim Co., under New York laws, with $150,000 capital; to manufacture rims and parts. Corporators—William Kaul, Robert W. Ashley, Frank Oberkirsch, 47 West 34th street, New York City.

New York, N. Y.—Ames Automatic Shock Absorber Co., under New York laws, with $25,000 capital; to manufacture shock absorbers. Corporators—Louis Bomeisler, 135 Broadway; George H. Edwards, 250 Broadway; George Isaksen, 133 Broadway.

New York, N. Y.—Industrial and Trading Co., under New York laws, with $5,000 capital; to conduct a commission business in motor vehicles and parts. Corporators—A. M. Becker, John A. Lemline, E. H. Ferguson, all of 27 William street, New York City.

New York, N. Y.—Knickerbocker Havers Co., Inc., under New York laws, with $50,000 capital; to deal in motor cars. Corporators—Erastus M. Cravath, Locust Valley, N. Y.; Albert C. Hubbel, 92 Fifth avenue; Burwell M. Crossthwait, Pelham Manor, N. Y.

Grand Rapids, Mich.—Hand Corporation, under Michigan laws, with $30,000 capital; to manufacture and deal in motor car accessories. Corporators—George G. Whitworth, Louis A. Cornelius, Harold C. Cornelius, George H. Hand, J. Arthur Whitworth.

Brooklyn, N. Y.—Monarch Auto Trucking Co., under New York laws, with $5,000 capital. Corporators—Daniel R. Rice, Eighth avenue, New York City; Helen Person, 367 Sterling place, Brooklyn, N. Y.; Walter H. Babcock, 234 Powers street, Brooklyn, N. Y.

New York, N. Y.—Englebert Tire Co., under New York laws, with $100,000 capital; to manufacture motor car tires. Corporators—Samuel K. Kellock, 135 Kenmore place, Brooklyn; Clarence B. Campbell, 16 Sidney place, Brooklyn; Edward W. Elverson, 82 Beaver street.

New York, N. Y.—Detroit Cadillac Motor Car Realty Co., Inc., under New York laws, with $100,000 capital; to act as a property holding company. Corporators—Henry Amerman, 2 Rector street; Charles T. Green, 30 Pinehurst avenue; Edwin B. Griffin, 337 West 14th street.

Buffalo, N. Y.—Buffalo Resilio Co., under New York laws, with $25,000 capital; to manufacture tire filler. Corporators—Stafford D. Noble, Alexander D. Falack, Philip F. Lonergan, Henry B. Collin, Samuel Welsch, Daniel L. Tharp, Raymond F. Nicholas, all of Elmira, N. Y.

MARMON TO BE NEXT HEAD OF SOCIETY OF ENGINEERS

Nominating Committee Selects Indianapolis Manufacturer for S. A. E. Presidency—Others Slated for Office.

Howard Marmon, of the Nordyke & Marmon Co., Indianapolis, will be the next president of the Society of Automobile Engineers. He has been selected for the office by the nominating committee, which just has presented its report, the nomination being equivalent to election.

The nominees for the other offices are as follows: Vice-presidents, Russell Huff, Packard Motor Car Co., and John G. Perrin, Lozier Motor Co.; treasurer, Herman F. Cuntz, Automobile Board of Trade; members of council, Eugene F. Russell, Locomobile Co.; Harold L. Pope, Pope Mfg. Co., and Joseph A. Anglada. Coker F. Clarkson, of course, will remain secretary and general manager of the society. Marmon will succeed H. W. Alden, of the Timken-Detroit Axle Co., who, as vice-president, succeeded to the higher office on the death of H. W. Donaldson in August last. The constitution of the society does not permit of re-election to the presidency.

In addition to President Alden, the officers who will retire are Harold L. Pope, vice-president; Hermann F. Cuntz, treasurer; Henry May, Howard Marmon and Charles Ethan Davis, members of the council. The members of the council who hold over are Charles B. Whittelsey, Hartford, Conn.; Arthur B. Cumner, Philadelphia, Pa.; Andrew L. Riker, Bridgeport, Conn.; Hermann F. Cuntz, New York, N. Y.; Howard E. Coffin, Detroit, Mich.; Henry Souther, Hartford, Conn.

The officers are elected by mail vote, the result of which will be promulgated at the annual meeting of the society, which will occur in New York City in January.

Changes Among Prominent Tradesmen.

A. L. Talbott has been appointed manager of the Atlanta (Ga.) branch of the Swinehart Tire & Rubber Co. He succeeds C. E. Holmes, resigned.

Frank Blaney has been appointed sales manager of the Columbus Buggy Co., of Columbus, O. Previously he was identified with the Havers Motor Car Co., of Port Huron, Mich.

E. L. Rettig has been selected for the post of manager of the Pacific Coast branch which the Federal Rubber Mfg. Co. is about to establish in San Francisco. As he has been connected with the Diamond branch in that city for nine years, it goes without saying that he is well acquainted with the territory.

George S. Waite has been appointed sales manager of the W. A. Patterson Co., of Flint, Mich., maker of the Patterson car. Previously Waite was assistant sales manager for the E. R. Thomas Motor Co., of Buffalo.

J. W. Cully has been appointed manager of the Detroit branch of the Swinehart Tire & Rubber Co., succeeding S. G. Andrews, who recently went into the retail trade in Saginaw, Mich. Previously Cully was connected with the New York Swinehart store.

Walter C. Lineaweaver has been promoted to the management of the Newark (N. J.) branch of the Goodyear Tire & Rubber Co. He succeeds George Hancock, who hereafter will devote himself wholly to the Goodyear wholesale interests in the State of New Jersey.

W. A. Somerville has been appointed assistant sales manager of the Stromberg Motor Devices Co., of Chicago, to fill the vacancy caused by the death of Ray Ballinger. Somerville will combine his new work with his duties as advertising manager of the Stromberg company, which latter office he has filled for some time.

M. D. MacNab has resigned the general management of the United Motor Chicago Co. to become vice-president and sales director of the Marion Motor Car Co., of Indianapolis. For three years MacNab has had charge of the Maxwell and Columbia interests in a wide expanse of Western territory and, therefore, "knows his book." He will make his headquarters at the Marion plant in Indianapolis.

Owen and Reo Remove from Broadway.

High rental, which has cut so deeply into the profits of all who do business on the famous thoroughfare, has been instrumental in deciding R. M. Owen & Co., eastern distributers of Reo cars, to leave Broadway. Accordingly, they have removed from 1759 Broadway to 19-21 West 62d street, New York. R. E. Ingersoll, manager of the Reo eastern branches, frankly admits that the rental had reached such a figure that choice was left of either raising the price of the Reo car or finding a location elsewhere, and they chose the latter alternative.

Cook Heads New Body Company.

Robert H. Cook, former general manager of the Auto Body & Specialty Co., of Flint, Mich., which became enmeshed in litigation, has organized the Cook Body Co. and taken over the plant and property of the old concern. The factory is located on West Kearsley street in Flint and will employ 50 men.

ODD OUTGROWTH OF TIRE CHAIN PATENT LITIGATION

Dealer Buys Grips Which Court Said Did Not Infringe — When Court Reverses Itself He Refuses to Pay and Is Sued.

Had not the United States Circuit Court of Appeals in Chicago said one thing and then changed its mind and ruled oppositely, Max Ziesler, who is the proprietor of the Imperial Auto Supply Co., of New York City, might not now be the defendant in a suit in the Supreme Court for New York county, brought by the Whittaker Chain Tread Co., of Boston, Mass., which is suing him for $125, the price of a quantity of tire chains bought by Ziesler early last year. The matter has been decided adversely to the Whittaker people in the City Court, but they have carried it to the Appellate Term of the Supreme Court, where they hope to be able to secure a ruling more favorable to their interests. The matter had its beginning as early as two years ago.

Early in 1910, when the Weed Chain Tire Grip Co. brought an action in the United States District Court in Illinois, charging infringement on the Parsons patent by the Zigzag grip, that tribunal sustained the patent. On appeal the higher court reversed the ruling and declared the grip did not infringe, thereby apparently wrecking the patent and making tire chains "open" to the world. It was at that time that the Whittaker company sold a quantity of its chains to Zeisler. But before Zeisler could dispose of them the Court of Appeals, on reargument, reversed itself and on July 27, 1910, declared the patent valid. Zeisler then shipped back the chains to the Boston concern and refused to pay for them. The present action, while disclosing a somewhat remarkable outgrowth of patent litigation, is merely to cause payment for shipment of the chains.

Kosmak Takes Over Cubit $3 Horn.

The Cubit Electric Horn Co., of New York City, which two months since presented to the trade an electric horn at the sensationally low price of $3, has been taken over by the Kosmak Electrical Co., a New Jersey corporation, which was formed for the purpose, and which will not only continue the production of the Cubit horn but also will produce a spark plug, a dry cell, an induction coil and an electric whistle, all bearing the style Kosmak. The Kosmak cell, it is stated, will depart radically from present practices.

All of the men interested in the Cubit company are identified with the Kosmak corporation, which is located at 17 Stevens avenue, Jersey City, N. J. Its officers are as follows: Walter Kosinski, of Jersey City, president; Charles T. Cubit, Eatontown, N. J., secretary; Mungo J. Currie, Jersey City, treasurer; John R. Mack, New York City, general manager. Kosinski was for many years with the old Phoenix Telephone Co. and later with the Bell Telephone Co. It is claimed for him that he originated the present dry cell battery. Cubit is secretary and treasurer of the firm of Reid, Yeomans & Cubit, of 140 Nassau street, one of the largest drug houses in New York City; Currie is a well known corporation lawyer of Jersey City, and Mack is an engineer of repute.

Ohio Supply Project is Completed.

The Federal Motor Supply Co., of Cincinnati, which was incorporated under Ohio laws with $250,000 capital stock, has completed its organization by electing the following officers: G. W. Platt, president; Fred H. Berold, vice-president; Jesse W. Wozencraft, secretary; Emil G. Schmitt, treasurer; Edward H. Maffey, William C. Straehley, C. T. Woodrow, J. William Theobald and F. W. Stukenborg, directors. Offices have been opened in the Fourth National Bank building in Cincinnati, and it is the intention to maintain not only a large supply house in that city but to establish branches elsewhere.

Cleveland Dealers Admit Bankruptcy.

On the application of Edward L. Graves, one of the partners in the Alco Cleveland Motor Co., of Cleveland, O., F. H. Pelton was appointed receiver on Saturday last, 12th inst. The company, which is a copartnership, consisting of Graves and Otto R. Michels, has liabilities of $9,507.84 and assets of $6,895.35. Graves places his personal liabilities at $153.25 and lists as his assets two suits of clothes and one watch, valued at $20.

Tudhope to Move Nearer to Detroit.

The Tudhope Motor Car Co., which reproduces the Everitt car in Canada and in which B. F. Everitt and W. E. Metzger are interested, is making ready to remove its plant from Orilla, Ont., to Windsor, Ont., which is directly opposite Detroit. The removal, bringing the Canadian corporation in close proximity to the Everitt factory in Detroit, naturally will greatly facilitate its operations.

Top Company Financially Involved.

The French Auto Top & Supply Co., of Chicago, Ill., has filed schedules, showing assets of $3,157.08 and liabilities amounting to $4,188.84.

MANUFACTURE OF TIRES TO BE UNDERTAKEN IN ST. LOUIS

J. A. Swinehart, Not Swinehart Company, the Prime Mover—Expects to Produce Tires Within Six Weeks.

Reports that the Swinehart Tire & Rubber Co., of Akron, O., was making ready to locate a plant in St. Louis, Mo., and which emphatically and authoritatively have been denied, have been followed by the incorporation of the St. Louis Tire & Rubber Co., in which J. A. Swinehart, formerly of Akron, is the chief stockholder. He, however, absolutely has no connection with the Swinehart company and the Missouri project is in no way identified or associated with the latter.

The St. Louis Tire & Rubber Co., which was incorporated early this week, is capitalized at $150,000, of which $59,100 is represented by Swinehart's patents and a contract executed with him. The remainder of the shares represent cash subscriptions. Swinehart is the principal stockholder, holding 900 shares. The other six, with Swinehart, constitute the board of directors, each of whom holds 100 shares. They are Harry C. Barker, C. M. Skinner, Webster Groves, Alfred C. Einstein, William H. Glasgow, Roy F. Britton and C. C. Collins, all of St. Louis.

The new company has acquired a building in University City, which is a suburb of St. Louis, in which the necessary machinery will be installed so quickly that, it is stated, automobile tires will be produced within six weeks. It also is the intention almost immediately to erect an addition, 30 x 100 feet, to the building in University City.

Ohio's Officers Appeal to Creditors.

Although differences between C. F. Pratt, president, and A. E. Schafer, vice-president of the Ohio Motor Car Co., of Cincinnati, were said to be in part responsible for the appointment of a receiver, both of those officers have joined in an appeal to the creditors, urging the rejection of what is described as "the proposition recommended by a wrecking attorney" and which aims to put the company through bankruptcy proceedings.

They declare that the company is not insolvent and will not confess insolvency, adding that it is their understanding that the receiver has under consideration "two offers for the plant as a going concern, either of which will realize more than twice as much for the creditors as the wrecking proposition."

AMERICAN MOTOR CARS STILL GAINING ABROAD

No Indication of Let-Up in Exports—August of Present Year 28 Per Cent. Better Than a Year Ago—Canada and Oceania Are Largest Buyers but Other Markets Develop.

Exports of automobiles from the United States continue to maintain their strength, the statistics for August—the latest period for which the figures are available—marking a gain of 28 per cent. in the total valuation of cars, parts tires and engines as compared with the same month in 1911. The increase in value of the exports was $507,700 and the figures for the Augusts of 1911 and 1912 were, respectively, $1,806,462 and $2,314,162.

Of a total of 1,321 automobiles exported, 57 were commercial cars and their value $107,245. The largest taker was Canada, which received 320 cars valued at $486,285. Next in rank are British Oceania, South America, Other Europe, Asia and Other Oceania and the United Kingdom. The greatest monetary gain over the exports of August, 1911, was made by Canada, which surpassed the previous figure by $171,848, an increase of 54 per cent. The geographical sub-division Other Europe gained by 55 per cent., or $62,011. The United Kingdom, which ordinarily is a heavy taker of American cars, fell away 53 per cent., or $113,238. Others who reduced their purchases were France, British Oceania and Asia and Other Oceania.

Of the South American countries, Argentina took 26 cars valued at $26,090 and 4 trucks valued at $7,053. Brazil purchased 107 cars valued at $102,132, and Chile, 2, Ecuador, 7, and Uruguay, 14 cars, $14,939. Other countries and their takings were: Australia and Tasmania, 143 cars, $60,842, and 1 truck, $2,163; Spain, 17 cars, $10,622; Sweden, 12 cars, $8,554; British South Africa, 32 cars, $27,218, and 1 truck, $570; Japan, 34 cars, $36,472; British India, 19 cars, $13,127; Panama, 6 cars, $4,931; Cuba, 9 cars, $11,126.

The American possessions—Hawaii, the Philippines, Porto Rico and Alaska—took cars in proportion to the order named, the total being $121,876 for August. The respective shipments to these four were $60,519, $31,562, $28,595 and $1,200, Alaska taking but one car. Hawaii took 42, the Philippines 29 and the island of Porto Rico 24 cars.

The valuation of cars, parts, engines and tires exported for the eight months ending with August was $23,103,855, a monetary gain of $8,737,062, or 60 per cent., over $14,366,793. the figure for the eight months ending with August, 1911. The gain in cars alone during the eight-month period was 61 per cent. Of the 16,807 vehicles shipped outward during the eight months, 135 were trucks, valued at $263,703. The record in detail is shown by the appended table:

August Tire Exports Show Big Gain.

During the month of August there was no indication of a let-up in the steady growth of the exportation of American tires, the gain for the month amounting to 57 per cent. The exports were valued at $405,781, as against $251,262 during August, 1911, an increase of $154,519. The chief takers of tires during the month were as follows:

England	$133,126	Brazil	$3,615
Canada	105,226	Trinidad	2,507
Belgium	87,241	Jamaica	1,880
Mexico	51,987	Panama	1,814
Japan	7,782	Philippines	1,333
France	4,140	Australia	1,226

For the eight months ending with August, 1912, the valuation of the tires exported was $2,240,826, while for the first eight months of 1911 the figure was $1,977,899, a gain of $262,927, or 13 per cent.

Oakland Locates Branch in Louisiana.

The Oakland Motor Car Co., of Pontiac, Mich., has established a branch in New Orleans, La. It is located at 745 Baronne street and is in charge of W. C. Gray.

NEW YORK, OCTOBER 17, 1912

EXPECTING TOO MUCH OF SALESMEN.

"Intensified salesmanship" has an awe inspiring sound but it well may be doubted that in seeking to improve the breed of order-takers their "intensification" may not be carried too far and to impracticable lengths.

It affords picturesque play for the imagination to maintain that the true salesman of automobiles, for instance, shall possess that knowledge which carries so very deeply as to reach into the mines from which the metal itself is extracted, or that the tire salesman shall be able to converse freely and entertainingly of the means employed to extract the priceless gum that grows on the banks of the Amazon; but it is greatly to be feared that if any salesman, or many salesmen, brought such knowledge to bear in prosecuting sales the prospective purchaser would be amazed and wearied to the disappearing point.

Carried to logical lengths, it requires that automobile salesmen incorporate the knowledge and virtues of the metallurgist, the botanist, the chemist, the electrician and heaven knows what else. It sounds superbly in theory, and such information undoubtedly makes interesting reading matter and is the sort of material of which attractive catalogs and other publications are made, but it has small place on the salesroom floor. People who seek to purchase motor cars or motor tires are not inclined to listen to lectures on metallurgy or rubber gathering.

In educating the salesman, it is of first importance that the educator keep his feet on the ground. The history or the romance of a particular industry cuts small figure in practical salesmanship, even of the "intensified" sort.

Generally speaking, knowledge of things in being is the chief essential, which implies that the salesman should know his car, or his tire, and that he should not be unfamiliar with the cars and tires of rival manufacturers. Such knowledge combined with tactfulness and a cordial manner will come near to carrying any salesman to the point of success. The blue skies, the mines and the rubber fields, the romance and the history, and the visions which they inspire, should be left to the writers of "fine frenzies."

WHEREIN TRUCK IS AKIN TO TROLLEY.

It is an indication of the progress that has been made in the construction of commercial motor vehicles that owners now are inclined to place them in charge of former drivers of horses rather than qualified chauffeurs. Were the motor truck a machine of many moods and whims, so to speak, requiring the constant attention of a highly skilled mechanic, the horse driver would have no place behind the wheel; and, as a matter of fact, it is only of comparatively recent times that it has been practicable to dispense with the high-priced specialist.

In this respect the motor truck is getting into the same class with the trolley car, which is intended to be driven by the motorman, but given what extra care it needs by specialists in the shops. Only in this way can the motor vehicle be made to operate with maximum economy, for it is obviously extravagant to pay a skilled mechanic to do drivers' work.

Apart from his inability to cope with mechanical troubles, the better sort of horse driver is a more suitable man for motor truck work than a regular chauffeur, not only because he is well satisfied with smaller pay, but because he is thoroughly familiar with trucking conditions and, moreover, knows many details of the handling of the material he hauls, all of which usually cannot be said of the "graduate" chauffeur. So it comes that the truck builder is solving more problems than the purely mechanical one of the truck itself, by making possible the economic division of labor.

FUEL TANKS THAT REQUIRE PROTECTION.

The increasing number of manufacturers who are adopting pressure feed fuel systems with the gasolene tank hung beneath the rear of the tonneau in the region of the rear axle, serves to emphasize the necessity for adequate tank protection. Not only does lack of protection lay the motorist open to the inconvenience of a shortage of fuel at a critical moment but there is the fire risk as well—made a visible hazard by the ever present tail lamp—with which to reckon. Already several dangerous fires have resulted from accidentally punctured tanks, at least two of which, both occurring the same night in New York City, during the crush incident to the recent naval demonstration, were occasioned by rear end collisions in which both the tank and the tail lamp were smashed, and other accidents of a similar nature are probable whenever and wherever traffic is congested, not to mention other occasions.

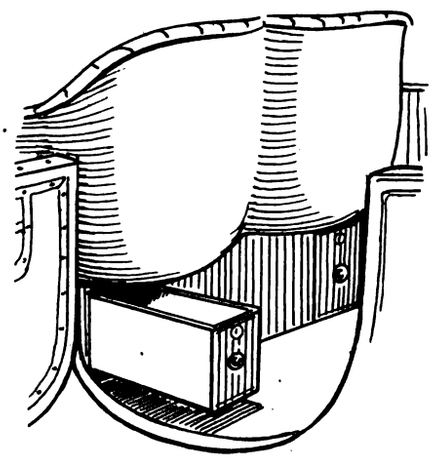
NEW COMPANY PROPOSES CHAIN OF COAST GARAGES

Already Has Purchased Three Garages in Los Angeles—Primary Object To Relieve Peculiar Local Situation.

To operate a chain of garages on the Pacific Coast, and particularly in Los Angeles, the Consolidated Garage Co., capitalized at $1,000,000, has been organized in that city. It has already acquired the "P. E." garage in the Pacific Electric building, the Wall street garage and the three-story C. C. & C. building on Los Angeles street. An option also is held on the White Garage on South Olive street. It is probable that other garages will be acquired or will be erected before the first of the year.

While its ultimate plans include the maintenance of a chain of garages reaching from Mexico to Canada, the immediate purpose of the Consolidated Garage Co. is to relieve a peculiar situation which exists in Los Angeles. According to a local ordinance, no car may stand in any one place for a period greater than 20 minutes, and as some 4,000 cars are used daily in the business district, the embarrassment which results is acute and much mixed. The garages which the company has acquired, and which it plans to erect in Los Angeles, are or will be located in the business district and will be so laid out as to permit of ready ingress and egress. In fact, by the system in view, it is figured that it will be possible to deliver cars to patrons at the rate of one every 30 seconds.

The officers of the company, nearly all of whom have been identified with the Los Angeles trade, are as follows: F. C. Fenner, president; Elton Isbell, vice-president; H. A. Eckert, secretary; S. S. McKinney, treasurer; A. C. Guild, general manager; John C. Stick, counsel.



Nashville has a "Clearing House."

Nashville, Tenn., has decided to try the clearing house plan in coping with its used car problem, and the dealers of the city apparently are welcoming the new enterprise, although it has failed ignominiously in other cities. The style will be Nashville Automobile Clearing House, Inc., which will do business at First street and Broadway in a three-story garage and salesrooms.

Officers have been elected, with F. L. Richard, formerly with the Sutherland Automobile Co., of Louisville, Ky., as president and general manager; E. A. Burrows, formerly with the Packard factory at Detroit, vice-president; J. M. Redditt of Nashville, secretary and treasurer. The other directors are R. M. Miller, attorney, of Nashville, and A. J. Casey, of Lebanon, Tenn.

Little Known Features of Well Known Cars

Where to carry tools and spare parts always has constituted more or less of a problem with motor car designers, a problem which was merely side tracked but not solved by the box located on the running board. The necessity, or at any rate the desirability, of having the tools and materials where they were "handy" naturally was accountable for the location; the call for cars of clean design, however, has set body designers to seeking out new locations, or, in cases where the running-board location is adhered to, to designing boxes which fit into the curves and lines of the body.

CADILLAC TOOL DRAWERS

One of the solutions—the one which is offered by the designers of the Cadillac car—comprises the usage of space not otherwise utilizable, and yet leaves nothing to be desired as to the facility with which the tools can be reached or so far as concerns the appearance of the car. As shown in the sketch, the instruments and spares are carried in two drawers of ample capacity for the accommodation of even more tools than generally are carried, which are located underneath the front seat, one on either side of the gasolene tank. The drawers open into the tonneau, and can be reached very handily by a person outside the car, simply by opening the tonneau door. A "catch" with which the drawers are provided prevents their jarring open when the car is in motion.

"Gasolene Engineers" as Reformers.

Just what will come of it is as yet a matter of speculation, but the radical reformation of the chauffeur is at hand, if any substantial results are achieved by the Gasolene Engineers' Protective Association, Inc., which on Tuesday last, 15th inst., filed its "papers" with the secretary of state in Albany, N. Y. The object of the organization, which may become national if it grows at all, is to put a stop to joy-riding, drunkenness and vice of every kind among chauffeurs and to help the police enforce the "rules of the road." Inasmuch as it has been charged that some 200 of New York city's chauffeurs are ex-criminals, it is needless to state that the "gasolene engineers" will begin work in the metropolis. Among the fifteen directors are William Hurst, Chauncey E. Drummond and Henry J. Ritzel, all of New York city.

SOLUTIONS OF
THE USED CAR PROBLEM

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Four Best Articles Dealing With the Subject.

By DR. H. M. FRYER, Riverside, Wash.

Revision or amplification of the guarantees that now prevail, doubtless will impress most of those engaged in the automobile industry as a radical means of solving or lessening the used car difficulty, but radical though it may appear, I am firm in the belief such revision or amplification will serve the purpose. For instance, let the guarantee be made to read about as follows:

We, the undersigned..... warrant this car No..... 1912 series..... to be made of good materials, and will replace free of charge, any part that proves defective within one year, provided such parts are returned charges prepaid to any dealer handling this car at the time.

At any time in the future, we agree to receive the above numbered car at our nearest agency equipped to make necessary repairs, repair the car at a reasonable charge to be paid for by the owner at the time of the repair.

We further agree to use reasonable diligence in reselling this car and to deduct from such sum received for the car an amount equal to the same per cent. of agents' profit as the original sale.

Signed.....

Analysis of the workings of this guarantee will disclose its far-reaching nature. Undoubtedly the older established makers would fare best, but as long as the advantages would be shared by the user, that feature would be without objection.

Mr. A may represent a class of users who purchase new cars every year. After a season's use, under ordinarily favorable conditions, cared for by a competent chauffeur, a car of the sort is worth two cheap cars.

This car Mr. A returns to his nearest dealer, who puts it in order and receives a fair remuneration, which the dealer ordinarily can figure clean profit as such work can be done by help regularly employed, and when not otherwise engaged.

The garageman has been benefitted and the car goes on the floor for sale.

Mr. B represents the buyers of the second class who believe such a car is better than a new cheap car, and presents himself as a prospective customer.

The dealer presents to Mr. B the guarantee originally given to Mr. A and makes the statement that if there is any doubt as to the guarantee being authentic, Mr. B may write the factory to have it verified. Mr. B buys the car at a price agreed upon by Mr. A and receives the same guarantee from the makers as was given when sold to Mr. A. The dealer receives his commission according to the guarantee.

This makes a fair return to Mr. A, the repair fees go to the mechanical department of the garage and the dealer has earned two commissions and received them.

Mr. B finds the car exactly as represented and has received a satisfactory amount of service out of it, and after a year or two the question again arises as to the disposition of the used car. Mr. B looking over his guarantee finds that any dealer representing the makers will take it back and repair it, provided Mr. B pays the charges, and the car will be resold in the same manner as long as the car has any value.

It is believed that Mr. A and Mr. B and the repair department and the dealer have gotten out of this car the greatest amount of profit and service, which has been equitably distributed.

Failure of the maker to stay in the business soon must become known to the users and a tendency follows to buy from the older manufacturers.

Makers would be stimulated to maintain a high standard of workmanship and materials, to the end that the advertising feature of a frequently resold car would be available.

The buyer would have access to a reliable history of any used car in which the maker would be equally interested with the buyer.

Every used car at the present time advertised for sale by parties not agents for the maker, is a menace to the reputation of that car, for the specific reason that the seller is not interested further than getting the greatest amount possible out of it.

The buyer of such a car is as likely to get little satisfactory service out of it, and the maker comes in for a share of the blame.

The makers of cars can well afford to stand back of their product as long as there is any usefulness in it.

By W. F. S., Cambridge, Mass.

In Massachusetts, as, I believe, in most other States, there are a large number of people who change their cars regularly each year. They will ride in nothing but the "latest model." They do not change because of any defect in their old car or any particular advantage in the new one; it is merely a matter of pride.

Now if all the manufacturers will adopt what is the only logical method of building cars; namely, producing them by "series," merging one into the other without distinction or loss of time, this class of yearly buyers will keep their old cars for a longer period than 12 months. Instead of yearly flooding the market with cars—perfectly good, but almost impossible to sell—the dealer could devote his energies to selling a new car to the man who otherwise would have been a more or less difficult prospect for a used car.

SYSTEMATIC ADVERTISING.

Why It Is Absolutely Necessary in Order To Bring Results to Dealers—Plan Worked Out by One Dealer That Proved Efficient.

The word "advertising" is used by many men to cover almost every phase of merchandising. If display windows are dirty or even poorly lighted, it is said to be bad advertising; very likely it misinforms the public as to the kind of dealer operating the store and the kind of cars he sells; therefore it is bad. If, on the contrary, windows are kept clean and neatly dressed it is called good advertising. All this is in the sense that anything that represents either the dealer or his methods to the public at large is some kind of advertising.

But, in this article, the word "advertising" is intended to cover the use of the printed message in the form of newspaper advertising—circulars, folders, booklets or letters. There is no doubt but that all these forms of advertising may be and can be used profitably by any dealer. There is likewise no doubt but that many of these forms of advertising are being neglected.

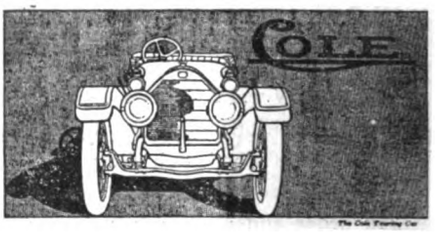
Manufacturer's Service a Big Opportunity.

These remarks are prompted by the remembrance of two barrels full of booklets, catalogs and other handsome literature standing beside the junk pile of a Pontiac (Mich.) dealer, whose garage and salesroom had been visited for the purpose of replenishing gasolene and oil supplies. Familiarity with printed matter made it easy to estimate that at least a hundred dollars of the manufacturer's good money was tied up in the barrels which were destined for the scrap heap.

It was obvious that, in spite of all that had been written and said about advertising, this dealer failed to appreciate the opportunities that came his way. All of which makes it pertinent to remark that advertising is one of the most important links in the chain of plans and activities that mean good salesmanship and good sales. This is true in any business, but especially true in the automobile business.

Merchandising plans that fail to take into account the varied dollar-making opportunities afforded by a systematic, carefully planned advertising campaign, may succeed, but they are quite likely to fall short of the mark. Therefore, the automobile merchant who is not only selling cars but building a business from which he hopes and expects to obtain a reasonable income for many years, finds it advisable and necessary to make a certain definite advertising appropriation for the season, based upon the number of cars he expects to sell.

Careful Planning Essential to Success.



How much the appropriation should be depends upon many factors—the price of the car, competition, local conditions, etc. No fixed rule applies equally everywhere, but in advertising, as in selling, the same general principles fit any locality or condition.

One of the first principles of good advertising is to have a plan. You do not get far in personal salesmanship unless you have a definite plan and work to it; you cannot get far in advertising unless you have a definite plan and work to it. Just as soon as one recognizes this fact he begins to emerge from haphazard methods to the era of good business and higher efficiency. In a word, he begins to eliminate waste or lost motion.

The Pontiac dealer had no plan: he was depending upon the sales that floated in; he worked solely upon the prospects with whom he came into personal contact. He neglected entirely the seed-sowing process that might have been working upon a thousand prospects at a cost of $10 a week for postage. The two barrels full of attractive, business-promoting literature might have been turned into a sales-building campaign.

Study Your Car and Your Prospects.

The successful fisherman is the one who not only knows what the fish looks like, but where it is found, what it feeds on at difference seasons of the year—the kind of bait that appeals to it—the best time to go after it, etc. In a word, he knows all about what he is angling for, and, using the proper bait, he generally lands it. The successful advertising plan works in just the same way. Usually there is no mystery about success when you study it backwards; the mystery is why so many men miss doing the plain, simple, direct, common sense things that would bring success frontwards.

122-Inch Comfort!

The beauty of the $4,000 or $5,000 car is its comfort. Passengers are not packed in like sardines and huddled up close to the motor. There is room to spare and the occupants are out of the zone of motor vibration.

That is because the high-priced car has a long wheelbase. Long wheelbase also makes the car ride easily, smoothly, steadily. It reduces road bumps and smothers vibration.

Like the high-priced car the Cole has a long wheelbase. 122 inches—every inch for comfort. And the Cole price is not $4,000 or $5,000. It is $1,885.

If the Cole had no other distinctive feature, it would deserve the consideration of every motor car owner or prospective owner.

But the Cole also has a reliable Self-Starter—no cranking. It has the Ward Leonard Dynamo Electric Lighting System—lamps and headlights lighted from the seat. It has demountable rims—no trouble to change tires.

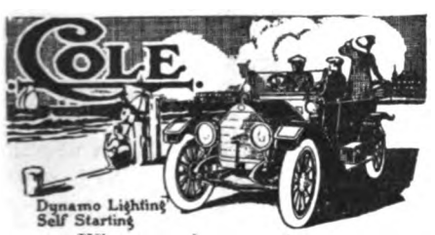
From every standpoint the Cole is the car for ease of riding and ease of mind. Made in Coupe, Limousine, inside drive Limousine, 5-Pass. Touring Car, Toy Tonneau, Torpedo Roadster, and Special Speedster.

All Cole models will be on exhibition at the Grand Central Palace Automobile Show

Colt-Stratton Company

2000 Broadway, at 66th St. Phone, 6000 Columbus

ONE OF THE COLT-STRATTON ADS WHICH EMPHASIZED COMFORT.



Digitized by Google

AWAKE-NDISING WORLD

The Colt-Stratton Co., 2000 Broadway, New York, eastern distributors of Cole cars, are typical of the modern automobile dealers who study their prospective customers and see in each piece of literature forwarded by the factory a selling opportunity. When anything new comes from the factory, time and thought are given to determine how best it can be used in business-building. They advertise in the newspapers and advertise well; they follow it up by letters to their prospects. By these common-sense, tried-out methods they have built up a big business.

Sought Out a Convincing Point.

After carefully canvassing the situation at the beginning of the 1912 season, the Colt-Stratton Co. decided that inasmuch as all cars in their price class were uniformly reliable the great feature the buyers of cars of this class were particularly interested in and keen on getting was—comfort. A series of advertisements was prepared, all emphasizing comfort—comfort through the long wheelbase; comfort through the luxurious upholstery; comfort through the long springs; comfort through the lighting dynamo and the electric starter, etc., but always and everywhere the long 122-inch wheelbase was featured.

ANOTHER COLT-STRATTON AD. WHICH MAKES THE MOST OF WHEELBASE

Hammered Hard On One Point.

Now, here is where the cleverness of the planners is seen: They placed their advertisements in the newspapers, but their campaign did not end there. As each advertisement appeared it was clipped from the paper or a newspaper proof of it sent to a list of prospects, with a letter.

The first letter was just fourteen lines long. It told the receiver that the Colt-Stratton Co. would like to write him (or her) a letter occasionally, or perhaps send a folder once in a while telling about Cole cars. A postcard was enclosed, and if the recipient did not wish to hear more about Cole cars the postcard could be used to head off further letters. At the same time Mr. Stratton, vice-president, who signed the letters, closed the letter by saying, "I hope I won't get the postcard."

Needless to say, he got very few postcards. The second letter was accompanied by the folder referred to in letter No. 1 and further stated that a catalog was waiting for the prospect and that signing the enclosed postal would bring it. This time, Mr. Stratton said, he "hoped he would get the postal." Those who did not return the postal received another letter enclosing another postal and another folder. The fourth letter told how successful the Cole company had been; the fifth asked criticism of the advertisement that had run in the papers and enclosed a copy. The opening paragraph stated that in the course of a discussion some people had argued that the feature most buyers were interested in was reliability, but that the writer thought all cars of equal price were reliable and that buyers were chiefly concerned in comfort.

The series consisted of twelve letters, the crowning piece of literature being an advertisement quoting the experiences of a large number of local Cole owners.

The characteristic feature of all letters was a friendly yet dignified tone—and a conspicuous lack of any intention of "hounding" sales. There was just the right measure of enterprise mixed with a cordial invitation to have the prospect come to the salesroom and see and judge for himself. It was an ideal series; it was carefully and thoroughly planned and systematically carried out. And in these two points, careful planning and systematic execution, are found the salient principles of any successful campaign of advertising or salesmanship.

"Annealing" Glass with Salt Water.

Strange as it may seem, merely to boil glass articles in a weak solution of salt and water and then to allow them to cool slowly has a very marked effect in reducing their brittleness. Incidentally, the treatment makes the glass less susceptible to fractures due to quick cooling after it has been heated, as, for instance, under the influence of the acetylene flame in head lamps or the oil flame in side lamps. The treatment is styled annealing.

PROBLEMS INVOLVED IN GAS TURBINE CONSTRUCTION

How Overcoming First Difficulties Has Raised Others and What They Are—Heat the Greatest Problem of All.

Despite the strong attraction of the gas turbine and the advances which have been made toward its perfection within a comparatively few years, there still remain many problems which must be solved in a practical way before such prime movers may become practical. The steam turbine no longer is an object of curiosity. But the word gas as applied to turbines is intended to convey that the actuating medium is composed of the products of combustion. Nominally, to burn coal, for instance, in order to obtain gas which may be utilized in a turbine, appears on the surface and actually is a simpler matter than to burn the coal to produce steam, which in turn is used in the turbine. And briefly this explains one of the principal reasons for the appeal of the gas turbine, for by its use at least one function is eliminated.

Gases Difficult To Explode.

With the elimination of that function, however, another is added. Coal gas, or illuminating gas, or producer gas, or gasolene gas is difficult to explode unless it is compressed and mixed with the proper proportion of air. The mixture of the gas with air, of course, is a simple matter, though the compression of the mixture introduces problems which are difficult of solution. Without going deeply into the matter, the effort required to compress the mixture generally is only slightly less than the effort put forth by the machine when it is running, the concrete result being that the efficiency is considerably lower than can be entertained. Gradually, however, such difficulties have been overcome, and there are at present several excellent examples of the gas turbine in operation abroad. In America, Nikola Tesla has been actively engaged in perfecting a gas turbine of his own which operates on an entirely different principle from any of those which are in existence. The machine, however, still is in an experimental state.

Intense Heat of Burning Gas.

With the practical elimination of the difficulties attending compression of the mixture to an explosible degree, still another problem crops up, and it is with this one that designers chiefly are concerned at the present time. With the steam turbine, extreme temperatures of 1040 degrees Fahr. with super-heated steam are handled quite readily, but with the gas turbine the burning gas often reaches to four or five times that temperature and therein lies the difficulty. The solution of the problem requires first that proper materials to withstand the terrific temperatures be used, and, secondly, that some means be provided for cooling the rotor blades and the combustion chambers. The cooling of the combustion chambers presents no particular difficulty, for they may be water jacketed after the manner of the ordinary gasolene or gas engine, but in cooling the rapidly rotating blades other means must of necessity be employed.

Holzwarth's Scavenging System.

In the Holzwarth system, which is of German origin, the stream of hot gases introduced into the revolving parts is followed by a scavenging current of cold air to ensure a moderate temperature, the walls of the explosion chambers being thus exposed to the high temperature gas only for the fraction of a second. The inventor of the system considers that the influence of differences of temperature does not constitute an obstacle to the construction of an explosion turbine on this plan, and experiments carried out on machines made under his system would seem to indicate that the materials in common use—cast iron and steel—can be employed safely for all the constructive details and parts, including the turbine blades and nozzles.

Has Several Combustion Chambers.

One of the peculiarities of the machine constructed under the Holzwarth-Junghans patents is the employment of several combustion chambers, each with the requisite adjuncts which are arranged in a circle around the motor and come into action one after the other, by which means the turbine rotor receives equalized power impulses. In running the machine the combustion chambers are filled with the mixture of air and gas at a comparatively moderate pressure, and the gases resulting from the explosion are discharged against the rotor and there exert their useful effect. After expansion is complete and the pressure of the injected gas has subsided, atmospheric air is blown or sucked in at low pressure and sweeps out the residual products of combustion. The chamber is then filled freshly with atmospheric air, the fuel mixture is blown in, and the charge is exploded by a spark. According to Holzwarth the extra work entailed by the operations of conveying the air needed for scavenging and for admixture with the fuel gas can be effected by the agency of the heat extracted from the waste gases.

A gas turbine on this principle, running at 3,000 revolutions a minute, has given up to 1,000 brake horsepower on suction gas of 1,100 to 1,200 calories per cubic meter. Experiments also have shown that liquid fuel of all kinds can be utilized, but if petroleum, gas-oil, or coal-tar-oil is employed it is necessary to raise the initial heat of the combustion chamber to approximately 1,000 degrees Fahr. if complete combustion is to be obtained.

Mixing Steam With the Gas.

Another method by which the high temperature of the ignited gas may be reduced has been patented by the Deutz Gas-Motoren Fabrik. According to this system, high pressure steam is mixed with the charge of fuel gas and air before ignition, and it is claimed to lend itself to gas turbines driven by separate explosions, charges of compressed air, and a charge of superheated steam being passed alternately into the combustion chamber. The advantage of this arrangement is that there is not only a decrease in the temperature but also that the work done at each explosion is augmented.

The characteristic feature of the system patented by Aug. Reuff, of Strassburg, Germany, is the periodic admission of air and of the fuel in such a way that the gas is introduced into the combustion chamber when it is filled with air. The unmixed charge of air is then allowed to pass out through a valve and the fuel gas is free to spread itself throughout the entire space available for combustion.

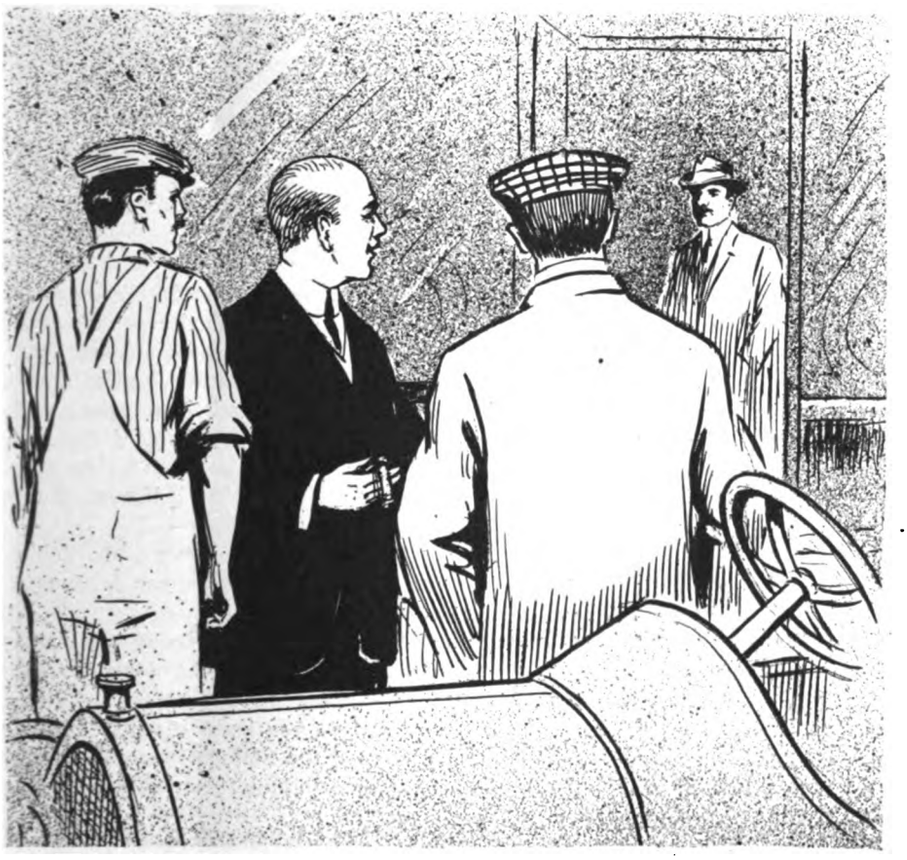
Big Screwdrivers and Broken Screw Heads.

A big screwdriver should be used very gingerly on a small screw that turns hard, for under the circumstances it is quite an easy matter to break off half the head Should this happen, the screw often can be removed by sawing or filing a new slot through the remaining half of the head and partly into the shank at right angles to the old slot, or by filing small flats on the half head and using a heavy pair of pliers.

Filing by the Reverse Process.

A small piece of metal can be filed to a true surface by moving it over a file which is held stationary much more easily than by the more usual reverse process. It is extremely difficult to run a file perfectly straight, but it is not difficult to hold the work flat on the file.

Blows that Cause Invisible Tire Damage.



A violent blow on a tire, such as may result from striking a good sized stone while running at considerable speed, is capable of rupturing the fabric inside sufficiently to cause a blow-out at some future time.

"TOO MUCH UNNECESSARY LYING" SAYS REILLY

Lets Fall the Opinion in the Course of a Discussion on Repair Work with Sales Manager—Truthfulness, Telephone and Human Nature Factors that Make Friends and Relieve Even Emergency Situations.

Reilly interrupted the conversation with the factory Sales Manager as a dust covered tourist tooted his horn in front of the doors, and before the stranger had time even to wonder if anyone was coming to see what he wanted the little dealer was on his way to the street; in his haste to leave the office he neglected to put on his hat, and the Sales Manager, remaining within the office,

"I'LL TRY TO FIX YOU UP," REMARKED REILLY

smiled as he saw the autumn sun transform the dealers' almost thachless scalp into a near-imitation of the dome of that famous State House in Boston. Then, moved by curiosity, the Sales Manager strolled to the door.

Transient With a Broken Spring.

The tourist was explaining that he had broken a spring and wanted a new one put in immediately so he could reach before supper the big city where was located the factory in which the car had been built and where the Sales Manager made his headquarters. Reilly called the repair-shop foreman.

"How long will it take to fix this? Can you do it at once?" asdked Reilly.

"It won't take long to put in a new spring," answered the foreman, as he inspected the damage, "but," and he looked at his watch, "it's three o'clock now and we've got the Clarendon car which is promised for four o'clock. It's almost finished, but all the men are pretty busy on hurry jobs, and if we get the Clarendon car out I don't see how we can do this before five."

"Just a minute, Mr. ———?" said Reilly to the stranger.

"Foote's my name."

"Well, wait just a minute, Mr. Foote," and to the Sales Manager who still was at the door the dealer said, "Jim, ask the girl to get John C. Clarendon on the 'phone. will you? Tell him I want to speak to him."

"I'll try to fix you up," remarked Reilly to the tourist, and straightaway hurried into the office, where the telephone was waiting.

"Mr. Clarendon?" said Reilly. "Yes, about your car. We promised it for four o'clock and it is nearly done now, but a tourist in one of our cars has just pulled in with a broken spring and wants it fixed. I don't want to disappoint you, and if you say so we will go ahead with your car, but you certainly will be doing him a favor if you could take your car an hour later. How about it? Will it be any inconvenience to you?"

Gets Permission to Delay Job.

The reply evidently was satisfactory, for Reilly, with a "Thank you," hung up the receiver. "Go ahead with the job," he directed the foreman; "Mr. Clarendon says five o'clock will suit him as well as four. He isn't going to use the car until late in the evening, anyway."

"We can have your car ready in an hour or less, Mr. Foote; won't you come in and wait? Our waiting room and, in fact, the whole establishment, is at your disposal."

"Oh, no; it will do us good to stretch our legs; we'll walk around town a while."

As Reilly and the Sales Manager went back into the office the whole Foote party was well on its way down the "row."

"Kind of fussy about an hour or so, aren't you?" ventured the Sales Manager in a tone which sounded as if he really meant it.

"Why not?"

The Sales Manager's answer was a shrug of the shoulders as he again settled into the chair he had vacated when the Foote party interrupted.

"Jim," said Reilly, "do you remember that order of five cars I sold to the several members of the Brownell family?"

A Five-Car Sale and the Reason.

"I certainly do. That was one good piece of work," was the enthusiastic answer. "Why?"

"Nothing," said Reilly, "except that just such a thing as I did to-day, bothering about 'an hour or so,' made those sales."

"How?"

"Well, to begin with, old man Brownell—

Digitized by Google

the one who owns the stores—generally leads the family in buying cars. What he gets the rest get. He used to drive a car that is about as high priced as any that is turned out. One day he pulled up in front here in tow of a taxicab. His clutch was broken. He wanted to know if I could fix it. I told him I could. He wanted to know when I could have it done. I called the repair-shop foreman and he said we could have it out the next night at six o'clock. I thought that was about the time we'd need, but I always like to get the foreman's word to make sure. Old Brownell didn't say anything except that he would send the chauffeur after the car at six o'clock the next night. Then he got into the taxicab and made off.

Ready Right on the Minute.

"The next night at six sharp the chauffeur walked in and asked if the car was ready. And it was ready, and inside of ten minutes the car must have been at Brownell's house. He used to send down here after that for all of his repairs, although the service station for his own make of car is nearer to him. I began to suspect that he was coming here because we turned things out as we said we would do, for he always took pains to ask the exact hour the car would be done and the chauffeur was always here on the minute.

"One day the old man himself dropped in to leave the car for repairs, and he came right out in his blunt way and said he was pleased with the way we turned out our work. He said it was not so much that we were better workmen than any other shop, but we always had things done when we said we would have them."

"But, Reilly," interrupted the Sales Manager, "How can you always tell just how long a job is going to take? That's something our engineers and expert repairmen at the factory can't tell."

Adds Margin to Estimated Time.

"I can't tell," said Reilly. "I can, however, tell just about how long it ought to take, and to make sure I add a little extra margin of time. The bigger the job, the more the margin. This spring job ought not to take long with the men hard at it, and unless something unforeseen turns up it will be out safe enough inside of an hour. And if we can notify a man his car is done ahead of time, don't you think he's pleased?

"But to get back to old Brownell. Even if I was somewhat surprised when the old man kept sending his car here instead of to his own service station, I was due for the biggest surprise of all when he drove up one day and began to talk car. He wanted to know if I thought we could make our car give as good service as the car he had been using. I told him we sure would, and then he wanted to trade in his car and get one of my new ones. He wanted too much, but when I showed him why I couldn't give so much he bought a car right then and there.

"Then the rest of the family began to come in, and inside of two months I sold the five cars. The rest of them were so anxious to follow the old man's lead that they were willing to take good prices on their old cars. I wouldn't wonder but that those sales also had paved the way to others, and the whole thing hinged on giving old man Brownell his car that first time just when I said I would.

"I always make it a practice to do that. The surest way of finding the right thing to do at any time is to put yourself in the other man's place. If one of my customers, or anyone else, for that matter, comes in here and wants to know when I will have a car done, I first find out when we can expect to get it out and then make the promise—and once the promise is made I'll move heaven to keep it. Take Clarendon, for instance. I told him I'd have his car out by four o'clock. Some men would have taken a chance on his not calling for it before five and would have gone ahead with the transient job, for transients certainly are entitled to consideration. I could have gotten away with it all right, but Clarendon is a much satisfied man since I called him up and asked him if he would wait another hour. He knows I'll have the car ready when I promised, and it will be ready, too.

Getting Permission to Break Promise.

"Very often I have to break a promise like this, but I seldom have had any trouble in getting permission to break it. Generally it doesn't make such a great difference to a man if his car is delayed for a time, and even if it is going to inconvenience him a bit, unless he is an out-and-out crank he will gladly do a favor for a transient who wants to get out on the road again.

"Down where Brownell used to get repaired, he told me, they used to promise anything. Their idea of making a satisfied customer was to promise anything he wanted, regardless of whether they could keep the promise or not. One day he went in with a worn brake band. It was so bad he disliked driving any further with it. They said they would have the car ready by the next day at 2 o'clock. At 2 o'clock his chauffeur telephoned him that the car was still in the shop. Brownell telephoned the shop, and this time he got a promise for three hours later. Three hours later they put him off again, until the next forenoon, and it was the following afternoon before he got the car. Then he went down and got it himself. He asked the manager why they hadn't got the car out on time. The excuse was that 'emergency jobs' had interrupted. He then asked them why they hadn't notified him. There was no answer to this. 'I suppose,' said Brownell, 'if emergency jobs keep coming in I would have to wait until Christmas for my car; is that the idea?' The manager began to trot out excuses, but the old man said, 'Don't say any more. There may be enough excuses, but there is no reason.' That was about the end of his business in that shop. His last experience there made it necessary for him to postpone a long tour to the mountains, and by the time he got the car it was raining and the roads were mud.

Keeping Promises as an Asset.

"Reliability in the promising line, Jim, is one of the most valuable assets a business man can have. It has taken me some years to build up the business I now have, but, without blowing my horn too hard, I believe I have a reputation for being truthful. I detest a liar; he's worse than a thief—and he steals more from himself than he does from anyone else. If I tell a man in this town anything he believes it, and there certainly are times that it comes in handy to be believed. There's an awful lot of lying in this business than can be avoided simply by remembering that human nature is pretty much alike the world over and that when it is necessary to delay a job or break a promise, if the truth is told, the 'other fellow' will be found ready to meet one more than half way. And with telephones so handy, it——"

"Mr. Foote on the 'phone, Mr. Reilly. He wants to know if his car is done," announced the office girl.

By the office clock it was ten minutes to four. "Tell him it'll be done in ten minutes," answered Reilly.

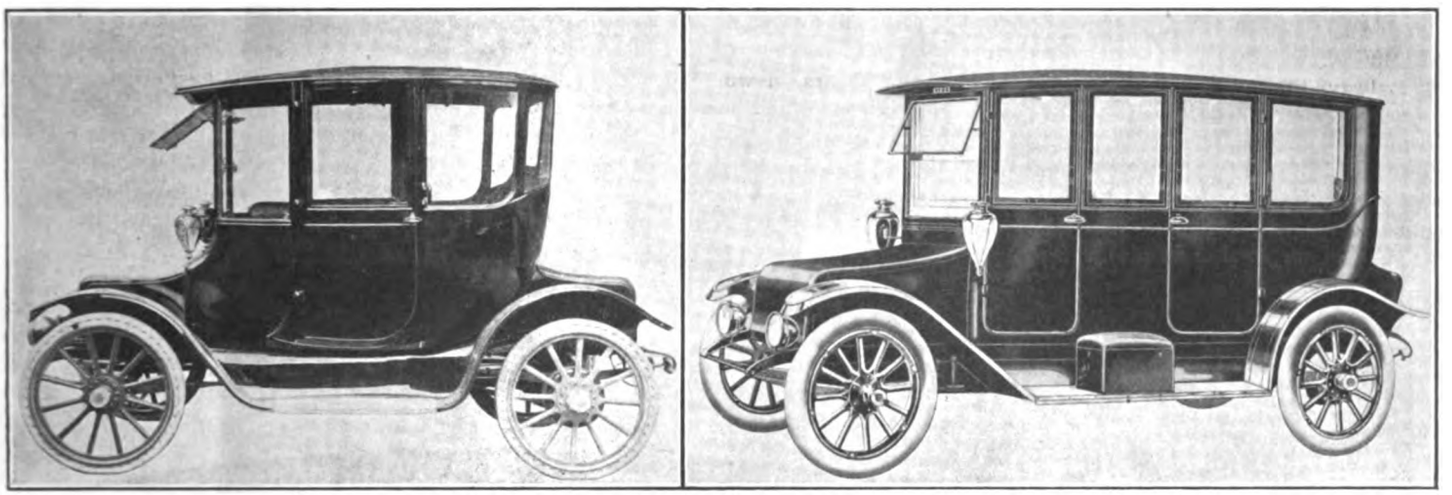
"How do you know it will?" impatiently exclaimed the Sales Manager. "You never even went to look. That's fine reliability!"

The Employe Truthful, Too.

"The foreman said it would be done at four o'clock, didn't he?"

"Yes," answered the Sales Manager, "but——"

"But nothing!" said Reilly; "if he said so it is so. I make him be just as truthful with me as I am with the public."



As Reilly spoke, the casting of a shadow across the salesroom floor caused both men to look across and out into the alley which led to the repair shop.

"See?" said the dealer with a gesture of triumph. Rolled out in readiness to be cranked up was the Foote car—and there were seven minutes to spare on the promise.

AUTOMOBILES CONSPICUOUS AT ELECTRICAL SHOW

Two New Trucks and Two Rectifiers Constitute Chief Elements of Newness – Pleasure Cars Illustrate Advances in Body Design and All Vehicles Exemplify Simplified Mechanism.

TWO NEW DETROIT ELECTRICS—A "CLEAR VISION" BROUGHAM AND A 7-PASSENGER LIMOUSINE

There can be no doubt that the sixth annual electrical show—it is styled in full, New York Electrical Exposition and Automobile Show—which is housed in Grand Central Palace, where it will remain until Saturday night, 19th inst., is a pleasing spectacle to look upon, what with its myriad of twinkling lights and its weird and wonderful apparatus.

Vehicle Makers to the Fore.

As becomes an exposition of electrical light, heat and power, the lights form practically the only decoration that has been attempted, although no shortcoming in this respect is apparent. Also, there is an abundant exhibition of heat, if it may be styled an exhibition—electric heaters in full blow, electric toasters and a hundred and one other heat producing electrical devices of which the average individual scarcely ever dreams. But the power element of the show is most eloquently suggested by the capable appearing trucks and the neat and silent electric pleasure cars that dot the main floor. Altogether there are just 11 brands of trucks and pleasure cars on view, which lends color to the forecast that the show would be the "greatest ever" as an exposition of electric vehicles exclusively, the word exclusively implying that no gasolene propelled vehicles share the limelight with the electrics, though, as has been told, there are many other things besides electric vehicles to catch the eye of the visitor. For instance, there are exhibits of four of the foremost storage battery manufacturers, any one of which individual "shows" is an exhibition in itself, admirably staged, well managed and educational to a degree seldom exceeded.

Of the twelve manufacturers of electric vehicles who were scheduled to exhibit their wares, only one, the S. R. Bailey Co.., failed to put in an appearance. The others are as follows: General Vehicle Co., General Motors Truck Co., Buffalo Electric Vehicle Co., Anderson Electric Car Co., Lansden Co., Studebaker Automobile Co, Atlantic Vehicle Co., Baker Motor Vehicle Co., Cleveland-Galion Co., Champion Electric Vehicle Co., and Ward Motor Vehicle Co. The battery manufacturers represented are: Edison Battery Co., Electric Storage Battery Co., Philadelphia Storage Battery Co., and Gould Storage Battery Co.

Baker Alters Design of Coupe.

Among those manufacturers whose exhibits embrace both pleasure and commercial vehicles, the Baker exhibit is conspicuous by reason of the inclusion of a new type of coupe in which the seats are so arranged that the occupants of the forward seats may face in practically any direction without obstructing the view of the operator. The design provides for the option of two methods of control, one being by means of the regulation steering lever operated from the rear seat and the other by means of a steering wheel on which is mounted the controller handle, operated from the forward seat, in which case all the passengers face forward. The front glass is in the form of a rain-vision windsheld and is especially low at the lower edge in order to permit the driver an unobstructed view of the road. Fenders are of leather, and throughout the construction unusual attention has been paid to details with a view to producing an exceptionally handsome and serviceable vehicle of the most luxurious type.

Improved Battery Suspension.

In the Baker two-ton commercial chassis which is displayed, several important alterations in construction are apparent. The battery tray, for instance, now is heavily braced to the side frame members in order to minimize the chance of injury to the batteries in backing up to loading platforms; the single set of service brakes has now been supplemented by an emergency set applied by means of a side lever and operating on drums on the countershaft; the frame has been strengthened by liberal reinforcements; a dust-tight casing has been placed over the controller mechanism; the trigger preventing the controller from being inadvertently thrown to the reverse position has been taken off the controller handle and placed on the segment, thus necessitating two separate movements to obtain reverse. Also, the Baker line of commercials has been increased by the addition of a new model which is rated at 3½ tons capacity and which is quite similar to its heavier and lighter predecessors except as regards the size of parts which are commensurate with the truck's capacity.

Digitized by Google

Detroit Adds a New Model.

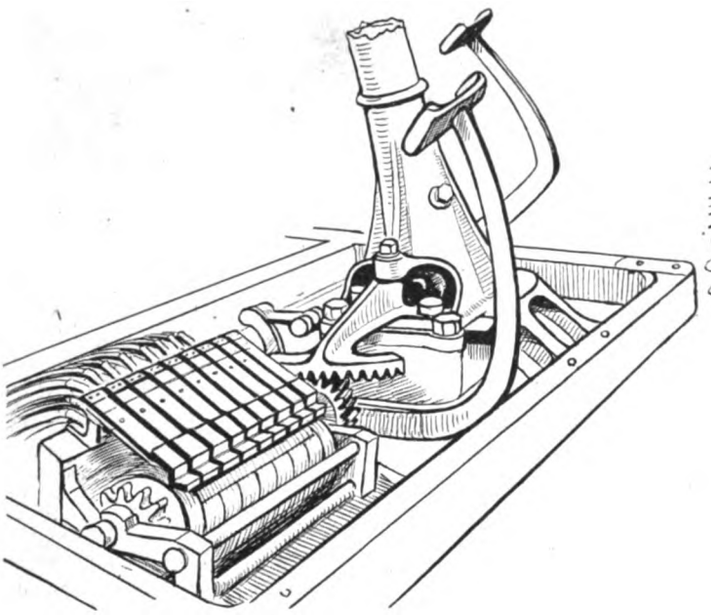
The Anderson Electric Car Co. of Detroit, Mich., also exhibits both pleasure and commercial vehicles, though the single delivery car which is displayed is not shown with the pleasure cars on the main floor but together with three or four other pleasure cars, is in demonstration service on the improvised "track." Of the two vehicles that are displayed on the main floor one is a brand new creation which displays a number of unusual features. It is styled a clear vision brougham, the designation serving as an indication that, regardless of the position of the occupants of its seats, the driver's view is unobstructed. The forward seats are of the individual type and are arranged so that the occupants face forward. The control mechanism is placed in front of the left forward seat. The other front seat is of the swivel type and is arranged to fold up out of the way when not in use. The clear vision idea is carried even to the construction of the back of the car, in which the older pattern corner panels are replaced by curved glass panels which permit an unobstructed view to the rear and sides.

Weight Reduced Where Possible.

Another quite unusual feature of construction is the use of aluminum for the roof instead of wood, the concrete result being that the weight of the vehicle is materially reduced. Weight reduction has been carried out systematically in other parts of the vehicle as well, castings and machined parts in a great number of instances having given way to drop forgings. By way of rendering control easy alike to the tall and to the short, a new type of pedal has been adopted, the new construction, which is pictured herewith permitting easy and quick adjustment of pedal height by the simple expedient of removing a couple of bolts and replacing them.

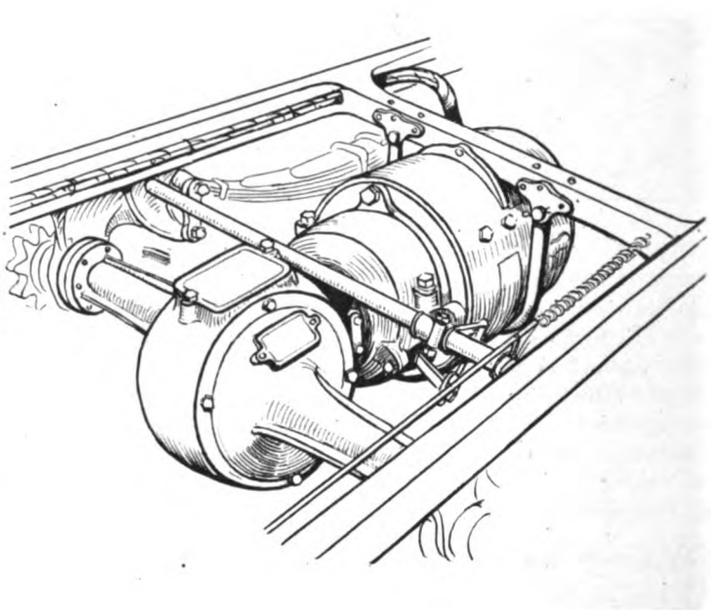
Buffalo Changes Hood Design.

Appearing for the first time under its new name, the Buffalo electric, as is natural, exhibits many of the earmarks of the former Babcock, though in the refinement which has been made a new type of slanting hood, which is the most apparent visible change from previous construction, has been adopted, to say nothing of several constructional alterations, which include a new type of rear axle calculated to raise still higher the high standard of efficiency of the cars.



First Electric With Wire Wheels.

Conspicuous among the four cars in the exhibit is a coupe mounted on McCue wire wheels—it is said to be the first electric pleasure car ever to be so equipped. In fact, wire wheels are optional equipment on any of the models, though on some of them their choice entails a slight increase in price. In all of the models except one a wheel is employed for steering, the different model being the first of its kind in the line to employ a lever steering gear. In the roadster models a decidedly "gasolenish" effect has been obtained with the aid of the new sloping hood, low hung bodies and carefully shaped fenders. And the effect is in no wise belied by their speed. They are capable of a maximum speed of 35 miles an hour, and under favorable conditions can cover as much as 75 miles on one charge of the battery. The standard battery equipment consists of 42 cells of 15 plate Philadelphia; Hycap-Exide Ironclad or Edison battery is optional, though at a slight increase in price, however.



Champion and Atlantic Make Debut.

Of the 11 makes of vehicles displayed, but one, strictly speaking, is new, though another is comparatively new in that it is making its first appearance at any show. The newcomer is the Champion, manufactured by the Champion Wagon Works of Owego, N. Y., for which the Champion Electric Vehicle Co., of 100 William street, New York City, is the sole sales agent. The other—the Atlantic—has, within the few months it has been on the market, created considerable of a reputation for itself, though it has not previously been publicly exhibited. It is manufactured by the Atlantic Vehicle Co. of Newark, N. J.

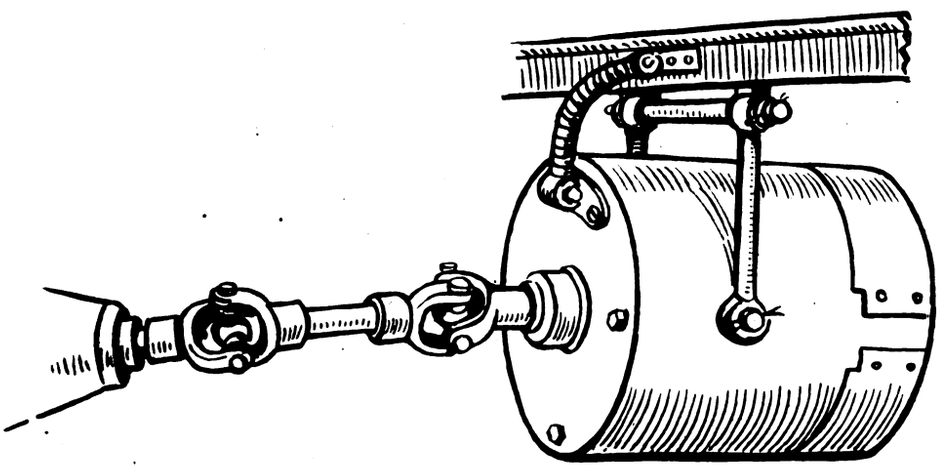
In evolving the Champion truck, the manufacturers have adhered closely to the use of standard materials, the idea behind the production being to market a vehicle for which repair or replacement parts can be obtained quite easily and with the least possible loss of time.

LANSDEN INTERCONNECTED CONTROLLER MECHANISM

LANSDEN UNIT POWER PLANT, SHOWING SUSPENSION

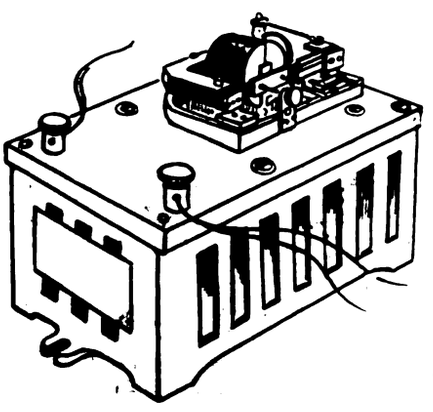
Replacement Question Studied.

With this desirable end in view all the component parts are of standard construction, produced by recognized parts specialists, and are readily obtainable from stock. The vehicle is made in two sizes, the larger rated at 2,000 pounds capacity and the smaller at 750-1,000 pounds capacity. In both vehicles accessibility has been made a fetish as much as it has in any other car, and as in an electric the battery is the part which generally requires the greatest attention and care, it has been placed up under the driver's seat, which may be tilted bodily, thus exposing the whole battery tray. Either Edison or lead batteries are supplied. Edison equipment consisting of 60 cells of either A4 or A6 capacity, and lead



Digitized by Google

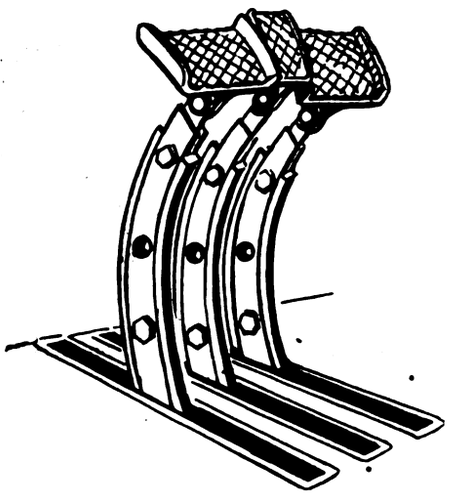
equipment consisting of 44 cells of 13 plates for the larger vehicle. For the smaller one, the equipment consists of 26 cells of 11 lead plates or 40 cells of Edison A4.



Simple Motor Suspension.

In the smaller vehicle, the manufacturers have adopted what is probably the simplest possible method of drive. The motor, which is a Diehl, rated at 36 volts and 35 amperes, is flexibly hung from a cross frame member and drives through a short shaft and two universal joints directly to the rear axle. The shaft is encased in a tight housing and the reduction gear is a combination bevel and spur. The whole arrangement is simple in the extreme, and there are few parts that are likely to get out of order or to require attention beyond occasional lubrication. In the larger vehicle, the motor, which is a General Electric mounted in Hess-Bright bearings, is similarly hung, but the first reduction is through the intermediary of a Morse silent chain with the final drive by side chains in one model and the same shaft drive in the other. The wheelbases of the two models are 80 inches and 100 inches, respectively, the available loading space being 122 inches by 60 inches in the smaller and 142 inches by 60 inches in the larger. Both are mounted on solid rubber tires, wheel sizes being 32 and 36 inches for the two models; tire diameters are proportionate.

The Atlantic, which is the other truck new to show-goers, is distinguished principally for its clean-cut, business-like appearance. To be brief, there is nothing radical or out of the ordinary in its make-up. The effort which has been made in its production to reduce parts to the minimum and to bring accessibility and simplicity to the forefront are easy of discernment in the single two-ton chassis which is displayed. The battery, which in the case of the vehicle on view consists of 44 cells of 17 MV Hycap-Exide, is carried beneath the loading platform, which is unusually long by reason of the location of the driver's seat nearly over the front wheels. The motor is an 85-volt, 28-ampere General Electric machine and drives through a "silent" chain to a countershaft and the regulation side chains. The wheelbase of this particular model is 9 feet 6 inches, and on a standard tread of 62 inches the available loading space measures approximately 10 feet 6 inches by 5 feet. Altogether, there are four sizes of trucks in the Atlantic line, including 1, 2, 3½ and 5 ton capacities, the specifications varying only as regards the size of parts.



MOTOR SUSPENSION AND DRIVE OF CHAMPION ELECTRIC TRUCK

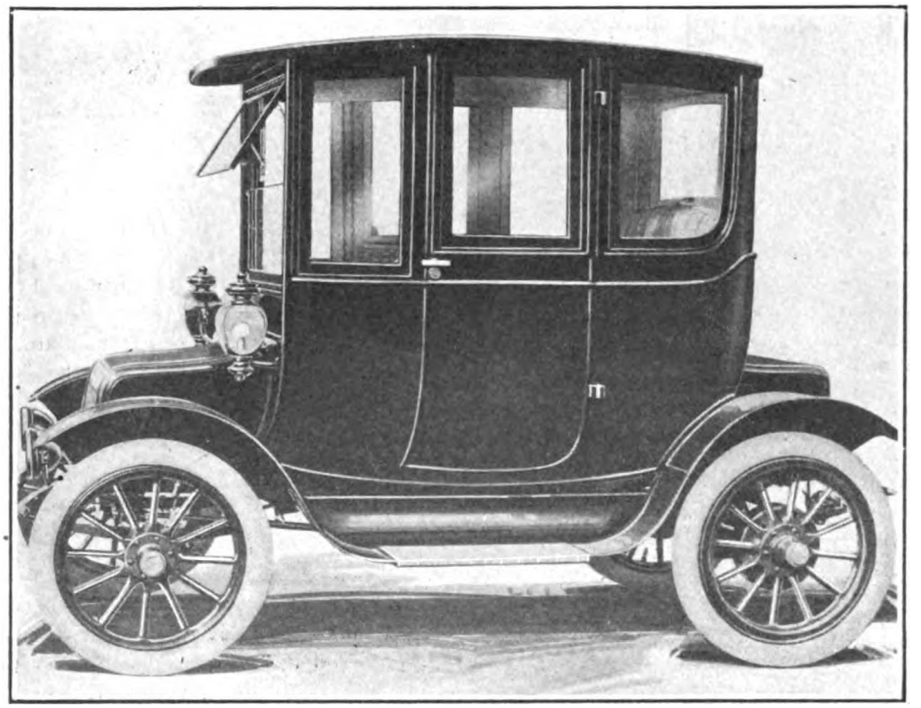
WAGNER A. C. RECTIFIER

Lansden Adopts Unit Construction.

The Lansden exhibit is conspicuous by reason of the fact that it contains, in addition to a brand new type of tank wagon which incorporates not a few new and interesting features, and a standard two-ton chassis, one of the new one-ton capacity chassis built around a new unit-construction motor and transmission system. In the new construction the motor, countershaft and differential mechanism form a rigid unit, which by reason of the method of attachment to the chassis frame provides three-point support. The motor drives forward to the countershaft by means of a very short shaft, final drive being by

DETROIT ADJUSTABLE PEDALS

means of the orthodox side chains. The controlling mechanism also has been altered slightly in order to provide means for interconnecting the emergency brake pedal and the controller. Under the new arrangement, which is illustrated herewith, depression of the emergency brake pedal first returns the controller handle to the neutral position, regardless of its position at the time the pedal is pressed, and then applies the brakes.



Five-Ton Electric Tank Wagon.

The Lansden tank wagon which forms a very effective background for the exhibit was constructed for the street cleaning department of the Borough of Richmond and is mounted in a standard five-ton chassis. The particular feature of the wagon lies in the incorporation of an automatic pressure maintaining apparatus by means of which the fluid in the tank is forced out over the road in two flaring sprays. Pressure is maintained on the water or oil, as the case may be, by means of a small electric motor driving a two-cylinder air compressor, the whole mechanism, together with the automatic switch, being carried in a small house just forward of the end of the tank. The usefulness of the pressure spraying apparatus, it is pointed out, lies in the fact that the water or oil may be thoroughly distributed over the road surface and does not tend to collect in puddles. Incidentally, the air pressure is useful in cleansing the tank of oil when it is desired to utilize it for water sprinkling.

General Motors Makes Few Changes.

A single five-ton chassis occupies the space alloted to the General Motors Truck Co., and except for a few minor alterations, which are strictly in the nature of refinements, it is the same chassis that made its initial appearance at the automobile show in Madison Square Garden last January.

Digitized by Google

NEWEST BAKER COUPE, RATED A MODEL OF LUXURIOUSNESS

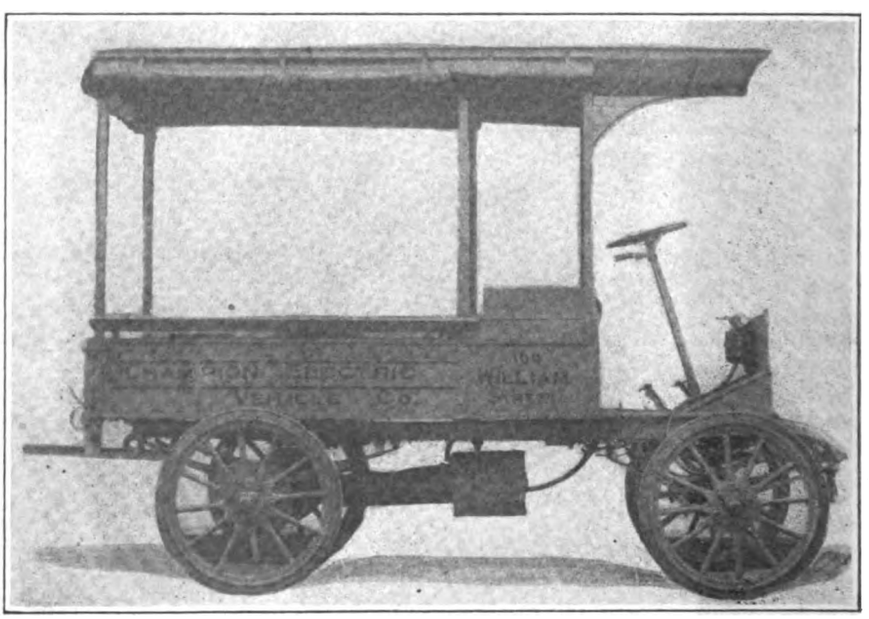
Carries Batteries Above Chassis.

One of the refinements which has been made lies in the adoption of a new composition material for the mounting of the controller and switches, which, as heretofore, are carried in an accessible position beneath a foreshortened hood in front of the dash. The vehicle is one of the few in which the batttery tray is carried above the chassis frame, which position, it is pointed out, is advantageous for the reason that any loading platform may be used in removing the battery from its tray; special battery platforms are unnecessary. The distinctive initial drive from a single heavy-duty motor through a flexible ribbon of steel to the countershaft ahead of the rear axle is retained without material alteration, and the final drive is by means of side chains.

G. V. Demonstrates Baggage Truck.

The General Vehicle Co.'s exhibit is another which is graced by a really big vehicle, a 3½-ton stake body truck, which, like the exhibits at the Studebaker and Lansden spaces, already has been sold and shortly will be delivered to its new owners. The remainder of the exhibit is made up of a 1,000-pound delivery wagon of the same type as several which recently were delivered to a prominent New York firm of jewelers, and a light station baggage transporting truck. For the edification of those who care to see the baggage truck in operation, and the remarkably easy way in which it can be manipulated in small spaces, one of these vehicles is demonstrated almost continually on the third floor, where an improvised "track" has been laid out for demonstration purposes.

Battery Tray Supported on Springs.



Among the few other manufacturers who stage really big electric trucks is the Studebaker Automobile Co. of South Bend. Ind., whose space is directly opposite the main entrance to the hall. In all, three vehicles are exhibited—a five-ton brewery truck, a two-ton truck and a 1,000-pound delivery wagon. In the smaller models few, if any, alterations have been made, though in the five-ton vehicle a number of important changes are apparent. The frame, for instance, now is of channel instead of angle section: the battery equipment has been changed to consist of thin plate cells and the mileage of the truck considerably increased; both the countershaft and the motors now are mounted in heavy-duty ball bearings; corresponding to the change in battery equipment, the motors now are slightly larger and are rated to consume 45 amperes. As heretofore, the two motors drive through self-contained spur gear reduction to the countershaft and thence to the rear wheels by means of side roller chains. One of the distinctive features of the line is that the battery is mounted on auxiliary leaf springs within the battery tray, thus effectually cushioning it from shock and preventing deterioration consequent to the plates.

Baggage Truck With Four-Wheel Drive.

One drive unit, consisting of an axle and a pair of wheels mounted on horses, is exhibited at the space of the Cleveland-Galion Truck Co. The vehicle of which the unit forms part is somewhat similar to the General Vehicle baggage truck in that it is intended for the same purposes, though it differs from it in very nearly everything else. For instance, whereas the General Vehicle truck drives and steers from only one end, the Cleveland-Galion truck drives and steers from both ends, the motive power in each case being supplied by a storage battery. The Cleveland-Galion truck was illustrated and described in detail in Motor World under date of September 5, and since then it has undergone no material alterations in design.

Ward Shows Only Trucks.

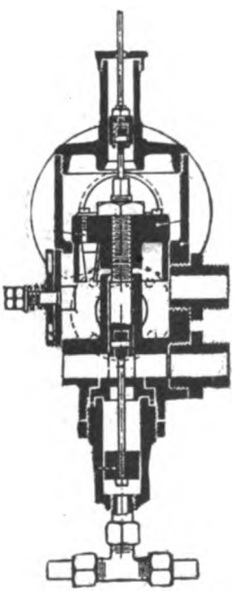
Other than those that have been mentioned, the Ward Motor Vehicle Co.'s space is the only one which is given over entirely to an exposition of commercial vehicles. But one truck, rater at 2,000 pounds capacity, is exhibited and is in the popular stake

CHAMPION 1000-POUND DELIVERY WAGON, SHOWING DRIVE

Digitized by Google

body form. As is the case with so many other manufacturers of commercial vehicles, little room for improvement in design or construction has been found, and such slight alterations as have been made have been by way of further standardizing parts so as to minimize time and labor lost in making necessary repairs or replacements. Wheels are fitted with S. A. E. standard rims as a means of facilitating tire replacements, and throughout the construction of all the vehicles in the line a visible attempt has been made to preserve a uniform appearance.

In the realm of the battery producer, four prominent manufacturers are represented—Gould, Philadelphia, Electric, and Edison. At the exhibit of the Electric Storage Battery Co. there is shown a complete power house unit set up and connected, in addition to vehicle, ignition and central station batteries in every condition of manufacture. Similarly, at all of the other three exhibits, batteries are exhibited with all their secrets laid bare, the Edison exhibit including the familiar and ingenious "jarring" device by means of which a half a dozen cells continually are lifted and dropped several inches the while they continue to light with undiminished brightness a row of incandescent lamps. At the space of the Philadelphia Storage Battery Co. considerable display of the thin plate type of battery which of late has come into such general use is made and the exhibit is rounded out with battery cases and plates and materials.



In the way of accessories, there is little to interest the average car owner, unless he happens to be one of the few who rely upon outside sources of current for charging their ignition or lighting batteries. Both the Edison alternating rectifier, which was illustrated and described in Motor World last week, and the new Wagner A. C. rectifier are displayed in operation. The Wagner rectifier, like the Edison device, is of the vibrating type, though it differs from the latter in that the vibrator coils are excited from the battery current instead of from the A. C. current. The device is simple in the extreme, is very small and compact, and is automatic in action. Its operation merely requires that it be attached to a convenient electric light socket and to the battery to be charged. It may then be forgotten until the battery has absorbed all the current necessary to bring it to a fully charged condition.

A very convenient form of material for some kinds of work is cold-rolled steel in rectangular bars. This is of the same quality as steel shafting, is soft and easily worked and is accurately finished and polished, as is shafting. It is made in quite a large variety of cross-sections.

KEROSENE CARBURETTER OF NEW DESIGN APPEARS

British Product of American Lineage Shows High Efficiency—Heat and Gasolene Necessary, However.

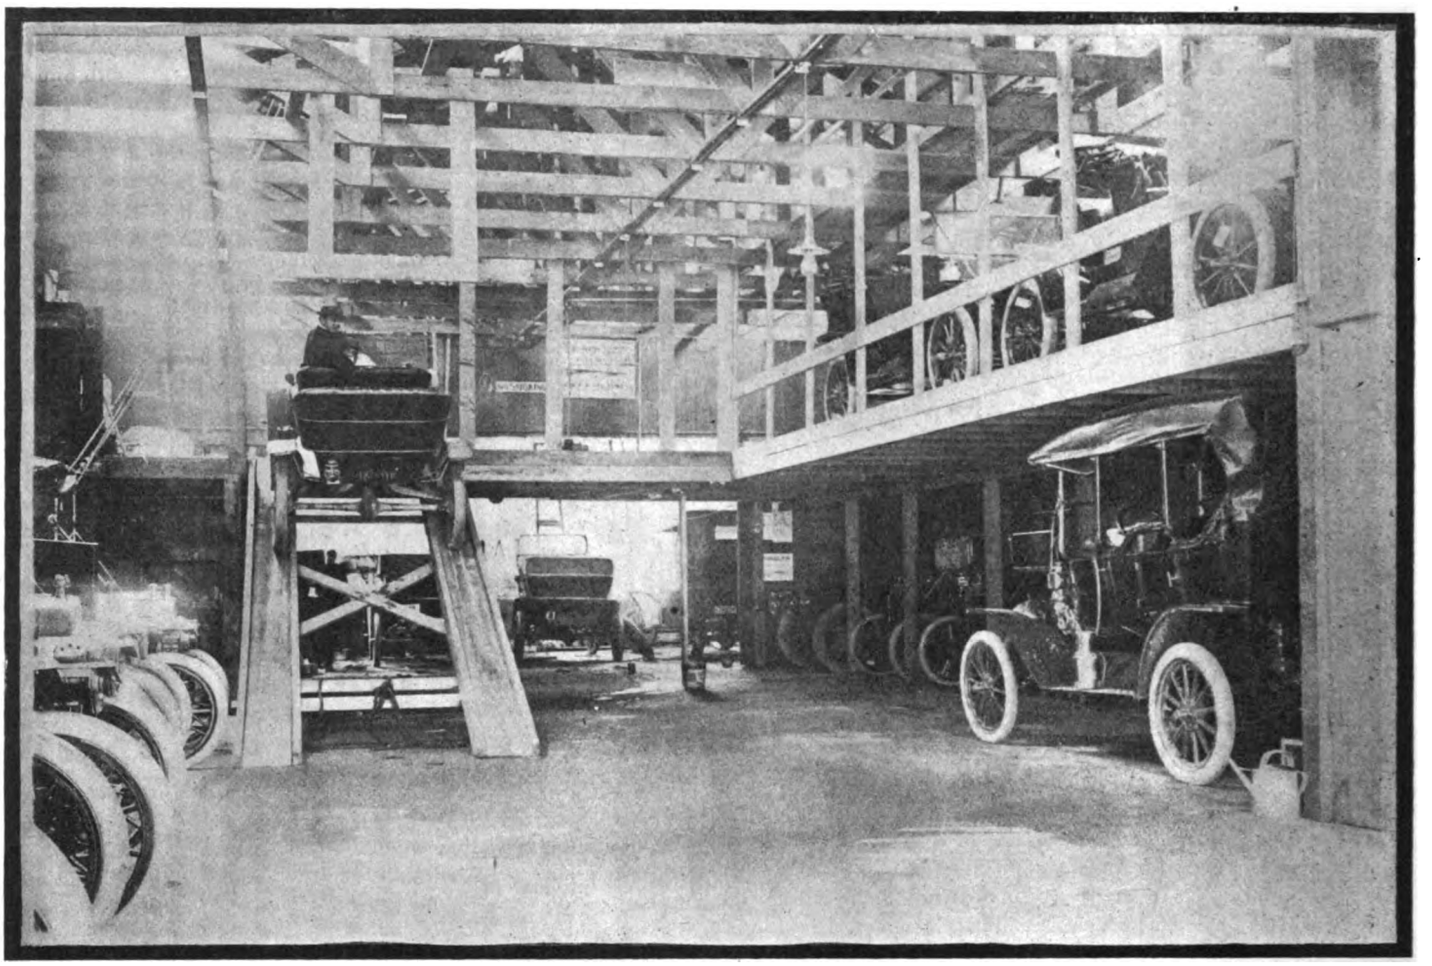
Kerosene carburetters have been no less striven for abroad than they have in America, and though an almost unlimited number of British and Continental devices of the nature have been brought out within a comparatively short space of time, none appears to hold more real promise than does the Stewart-Morris, which only recently has made its appearance. The device is the product of the Stewart Precision Carburetter Co.—which is the outgrowth of

STEWART-MORRIS CARBURETTER

the California carburetter of that name—of 199 Picadilly, W., London, England, and according to tests which were made under the supervision of the Royal Automobile Club, its economy in the matter of kerosene consumption was nothing short of remarkable. Despite its noteworthy performance, however, it still retains the inherent disadvantage of many other kerosene carburetters apparent in its inability to furnish gas upon which a motor can be started "from the cold." In other words, to make it an effectual device necessitates the carrying of a supply of gasolene for use in starting. Incidentally, heat is essential to its operation.

In structure, the carburetter differs considerably from anything else of its kind, though, as might be expected, it bears a striking resemblance to the Stewart gasolene carburetter produced by the same company. Its principal characteristic is that the suction of the engine is not relied upon to atomize the fuel. Instead, the fuel is forced through a small orifice under pressure and thus is effectually sprayed into the intake pipes. Before entering these pipes, however, the mixture of kerosene vapor and air first is passed through a "heater" formed of a copper coil inserted in the exhaust manifold. Having passed through the "heater" and thereby having become gasified, the mixture is returned to the carburetter for a further admixture of cold air and then is passed into the engine cylinders in the orthodox manner. For starting purposes, a small supply of gasolene is carried in an auxiliary tank connected to the carburetter, with the kerosene, by means of a three-way cock which serves to allow either fuel to be used. No adjustments for kerosene consumption are necessary.

According to the tests which were made by the R. A. C., the Pathfinder car to which the carburetter was attached was driven some 2,000 miles at an average consumption of 21.24 miles to the gallon of fuel. During the test, 1,000 miles were driven over ordinary roads, in which case the consumption figures out at 20.90 miles to the gallon, and 1,000 miles were driven on Brooklands track, when 21.59 miles were covered to the gallon of fuel. The best performance of the carburetter, gained at 25.2 miles an hour, showed a consumption of 27.19 miles to the gallon. In the course of the test the engine was started directly on kerosene 23 times, the longest interval between stopping and starting being 17 minutes. On nine occasions the engine was started on kerosene after gasolene had been injected into the induction pipe, the longest interval between stopping and starting being 45 minutes. The shortest period between starting on gasolene and switching over to kerosene was 10 seconds and the longest was 4 minutes 20 seconds.



To Determine "Squareness" of Pistons.

Though it is absolutely essential to the proper operation of an engine that its pistons be lined up "square" with the crankcase, in order to minimize wear, at factories there are a number of methods in use for determining their squareness, such methods scarcely are suitable elsewhere. It is a simple matter, however, to make sure that pistons are square by placing a straightedge between the lower edge of the piston and the crankcase, first making sure, of course, that the surface of the crankcase is perfectly clean. If the piston is not square, the discrepancy will show if a light is held behind the straightedge. Each piston will require to be treated separately and the amount of error in each should be determined before any corrections are made.

INCREASING SPACE WITHOUT ENLARGING GARAGE

How One Dealer Met the Requirement for Greater Storage Facilities by Erecting a Hanging Gallery Within His Premises—Inclined Runway That Serves a Dual Purpose.

SIMPLE METHOD OF GAINING STORAGE SPACE ON SAME GARAGE AREA, SHOWING RUNWAY LEADING TO GALLERY

Though the problems of the automobile dealer located in the West, on the Pacific Coast, for instance, are in many respects similar to those which have to be solved by the Eastern dealer, there are several phases of the situation which are peculiar to each. With but few exceptions the really big automobile manufacturing centers are located on the Eastern side of the United States, and the dealer thus is in close touch with the factory which he represents but there must of necessity be longer breaks between correspondence, and particularly between car shipments, in the case of the Western dealer.

This unalterable situation requires that the Western dealer carry a large stock and perforce provide considerably more storage space for cars to meet his demands. In order to be prepared for just such a demand, the arrival of which no man can foretell, the Western dealer must provide more ample storage space—and generally he must do so on the same capitalization as the Eastern dealer.

In this respect, the truth of the time-worn old saying to the effect that where there is a will there is a way has on more than one occasion been proven in the Western agency business. It is possible, for instance, where additional floor space cannot be obtained, either because it is unavailable or because its cost is prohibitive, to erect a gallery around an existing store-room and in this way practically double the floor area at a comparatively small expense. Which, briefly, is exactly the plan that has been adopted by McCabe & Brentnor, distributors of Ford cars in San Diego, Cal. The arrangement of the reconstructed garage is clearly shown by the accompanying picture.

The gallery is supported by means of steel rods from the ceiling, supplemented by heavy timbers resting on the floor, and the improvised structure affords a considerable increase in storage space. The cars are placed in their temporary resting places with the aid of an inclined runway, and, despite its steepness—the grade measures out at 43.52 per cent.—they are driven up it under their own power. Incidentally, the runway serves as a convenient test hill to demonstrate to purchasers the hill-climbing ability of Ford cars.

Penetrative Properties of Kerosene.

The power of kerosene to penetrate between metal surfaces that are in contact is surprising, but it requires time, and if sufficient time is not allowed no good results can be expected. Soaking for several hours generally is necessary.

Digitized by Google

GARAGEMAN WHO ADMITS HE'S MAKING MONEY

Says the Garage Business is Not Necessarily a Losing Venture—Recommends Watchfulness in Credits as One Essential—"Gasolene Discount" and Other Methods He Employs.

If asked, probably a large majority of the garagemen in New York City would second the sentiments expressed at a recent dinner of the New York Garage Association, when several speakers declared in open meeting that they were not making money; but Earl D. Wright, proprietor of Wright's Garage at West 158th street, Riverside Drive and Audubon place, admits that he is making a living and also putting aside something for a rainy day. In fact, Wright at the meeting in question arose and in substance said: "What's the use of saying we are not making money when we are? I am making a little money, but I want to make a little more. That's one reason why I'm here to-night."

Business Man First of All.

Wright, when a Motor World man called at his garage this week, said he meant what he said at the meeting but did not think it was particularly wonderful that a garage should make money. This latter part of his assertion may be the cause of some raising of eyebrows among those garage owners who declare life a financially profitless existence, but before anything is said about Wright's methods the whole story may be explanatorily prefaced with the statement that Wright is a business man in every sense of the word who before opening his garage, a year ago, had spent a dozen years in mercantile pursuits in the metropolis.

Many Cars Pass the Door.

His establishment is a two-story brick building which occupies the point of a triangle formed by West 158th street, Audubon place and Broadway, while a few feet distant is Riverside Drive. Last week a multitude of sailors from the fleet of battleships anchored in the Hudson River passed his door every day, but they were not more numerous than the cars which daily make use of the drive. This passing trade, however, is not the source of the garage's income; the profits come from the regular run of city garage business, storing, supplies, repairs, etc .

Capacity for Eighty Cars.

Although it has but the two floors, the garage can store 80 cars. One reason for the advantageous storing of such a number is the fan-like arrangement possible, the elevator being near the center of the base of a nearly isosceles triangle, the base being the longer of the three sides. Of course, this makes it necessary to place some cars in difficult corners or in front of others, but those which are left in the more difficult locations are those which are the least used; when they are to be used notice generally is given in advance, which permits their being ready by the time the owner is ready.

Space Economy Imperative.

An instance of the business training which helps make the garage pay is illustrated in a recent instance. Wright formerly had a storeroom for tires and supplies on the second floor at one end of the base of the triangle. He figured that room for the supplies could be found in a more convenient location downstairs, so he tore out the stockroom and made room for two small cars. This means $40 a month more without any increase in equipment, labor or rent. Also, instead of hiring a man to tear out the stockroom partitions Wright put on a pair of overalls and did it himself. The job performed, he cleaned up and went back to the office, the same business-like appearing manager he was before.

Bad Debts May Ruin Business.

He was asked what he regarded as most important in making his business pay.

"Following up credits," he promptly responded. "Bad debts," he added, "are the ruination of any business. You can go into some garages and look over the books and they look like ancient history. I have had but four accounts that I have failed to collect, and I expect to collect them. I apply a rule that used to appear on little blotters gotten out by a wholesale lace house with which I was connected for twelve years. It said, 'We predict failures; not notify you of them.' The interpretation is that the time to jog a man about his account is when he begins to grow lax, not to wait until he is so far in the hole that failure is almost inevitable."

Novel Gasolene Selling Plan.

Wright, like most other garagemen who attain to any success in the metropolis, insists that gasolene be purchased in the garage by the men who store with him. His price is 25 cents a gallon, a figure which may appear high to many owners, but it is subject to an arrangement whereby prompt payment of the monthly bill secures a price of 22 cents. Thus, a man who stores with Wright, provided he pays the storage and supplies bill by the 5th of the following month, is charged but 22 cents for "gas." If a man uses only 40 gallons a month, prompt payment saves him $1.20.

If he does not pay he is billed by the 10th, and if the account is not adjusted by the 15th the garageman begins to investigate. If necessary the car is held in the garage until the bill is paid. Several cars have been so tied up to secure an adjustment of accounts, but Wright states that never has he lost a customer because of this policy. They seem to appreciate being made to keep up.

Rates Not So High As Downtown.

Prices in Wright's garage are somewhat lower than they are further downtown. He is in what is known as the Washington Heights section and states that the class of owners in his locality are not so wealthy as those further downtown. His lowest rate is $20, this being for the smaller cars. From this figure the storage rate runs upward to $35 and $40, which is asked for the large limousines. The ordinary five- and seven-passenger touring cars are admitted at $25 and $27.50. These rates prevail in the eight or ten garages which are in the Washington Heights district.

Has Co-operative Scheme.

Supplementing his gasolene discount arrangement, Wright already has under way a scheme for co-operation among the garages in his section. He himself is a member of the recently formed New York Garage Association, but he believes small groups within the parent body can accomplish much good. He therefore is forming what may be called the Washington Heights Garage Association to protect credits and ensure against loss from bad debts. Although New York City is vastly different in many respects from almost any other city in the country, Wright's credit scheme is easily adaptable in any city or village which

Digitized by Google

has five or six garages or from that number up.

His idea is to form what is commonly termed a "blacklist," although a less harsh sounding name might be more desirable. If a man stores with Wright and leaves under circumstances which caused him to be termed undesirable, his name will be written on a sheet of paper and this sheet will be passed on to the next man in the local association. The second man will copy the undesirable's name on a private memorandum and, having added any undesirable he may have, he will pass the paper on to No. 3. No. 3 will copy what No. 1 and No. 2 have written and will pass it to No. 4. When the paper again reaches No. 1 he will tear off the names he had entered, everyone having seen them, and the next week will start the sheet again, adding at the bottom his new undesirables. Each week the paper will follow the same course, and when it reaches a man he will add his new undesirables and tear from the top of the list the names he wrote upon it the previous week.

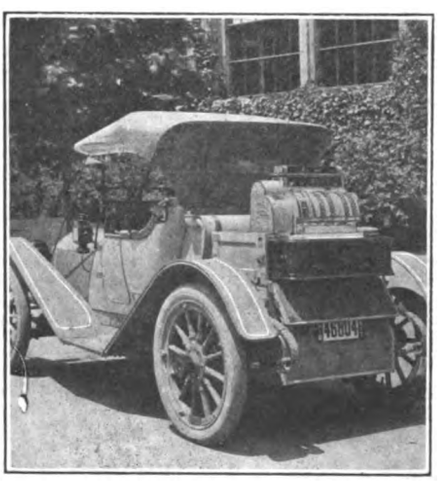
Neither is there any chance of a man's account being lost in the shuffle in Wright's office. There is no shuffle. The accounts are kept in original and carbon in a loose-leaf book, and when billing time comes one copy is sent to the owner. When the bill is paid the other copy, which is of a different color than the first, is removed from the loose-leaf book. A mere rapid turning of the leaves serves to show if any bills remain unpaid.

The "blacklist" scheme has been in use for some time in an unorganized way on Washington Heights. Only a few days ago a man, whose name may be the traditional and well-worn Smith, left the Wright garage declaring that he would not pay 25 cents for gasolene when he could buy it elsewhere more cheaply. To this arrangement Wright agreeably acquiesced, but told Smith he doubtless would have difficulty finding a garage where he could secure storage apart from the purchase of fuel. Smith, however, declared he would take his chances. Wright knew, from his association with other local garagemen, that Smith had stored in several Washington Heights garages and had left because of this same trouble. He therefore was sure Smith would go further downtown, in the direction of Harlem.

Wright has quite a number of good friends in the Harlem district, and accordingly telephoned to one that Smith had just left and might be down that way looking for storage and probably would fail to make any extensive purchases of gasolene at the garage. When last heard of Smith had been turned down at one or two garages, and by this time probably has located with a garageman who is not within the circle of co-operation. With such a system in rigid working order the garagemen would be fully protected from taking customers who are likely to cause regret on the proprietor's part.

Firm handling of business matters and strict attention to business has made Wright's establishment as popular as any of those in his section. Figuring things down to a business basis and then seeing that the garage gets every cent it is entitled to are secrets to his success. Just how much money Wright is making he declined to say. He was asked if his investment was paying 6 per cent., and he smilingly said, "Yes, I think I can safely say it is paying 6 per cent."

The expenses include Wright's salary. Figuring an investment was a bit difficult, for when Wright started in business the location was new for a garage and he had little to invest outside of his lease. His true investment, however, now may be said to consist of the value of his business, the reasonable price at which he would sell it were he to dispose of it today.



Accessories is an item which adds to the profits, although there is a wide field for improvement. At present such goods are displayed in a showcase in the office, whereas were they exhibited in a spot where they were visible to and had to be seen by every owner who entered the garage or by the thousands of motorists who pass the door, there would be greater knowledge of the fullness of the line carried. It is complete in that it consists of the articles which are in daily call among owners of cars, but as compared with those garages where the display is more pronounced the appearance of the stock indicates that its prominence is not sufficient, nor even just to the stock itself.

Knob that Indicates Position of Wheels.

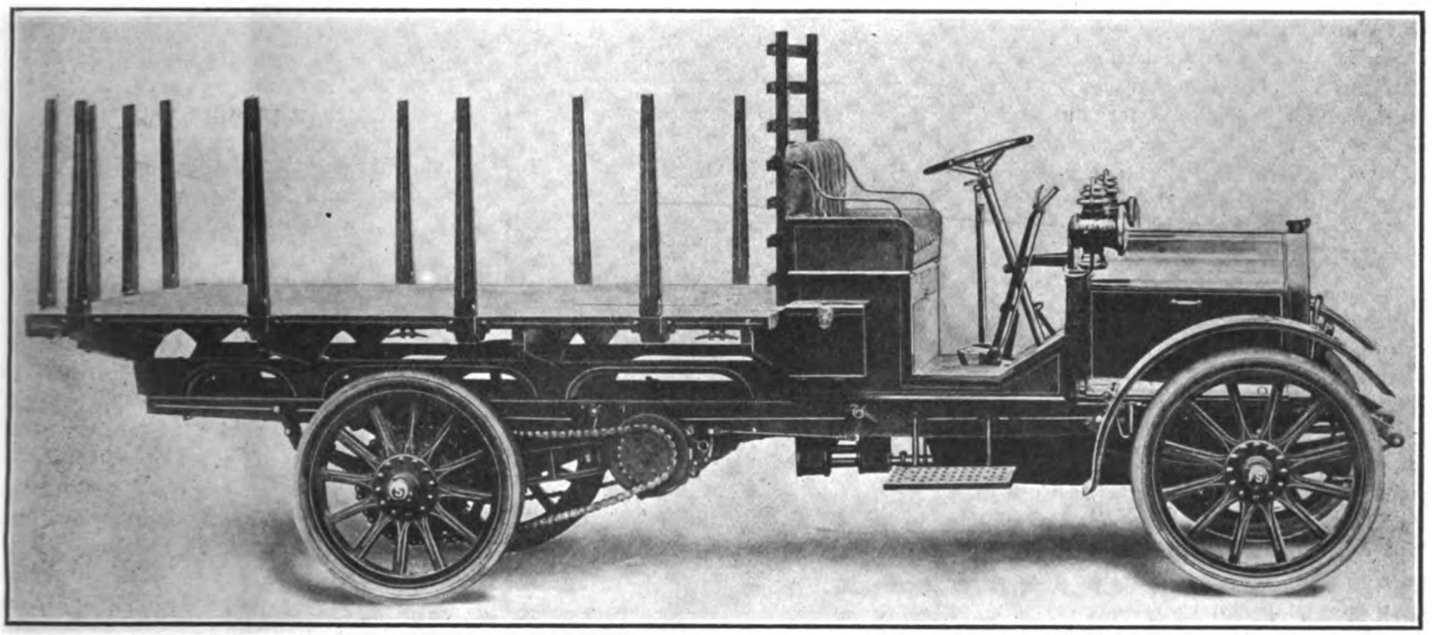
Indicative of careful attention to detail and unusual forethought regarding the operation of their vehicles, the manufacturers of Siddeley-Deasy cars, which are British productions, have adopted a novel method of making plain to the driver the position of the steering wheels, and it is so simple that the method may be modified to be applicable to any car. The method consists of inserting in the steering wheel a small "ivorine" knob the position of which indicates the angularity of the steering wheels. For instance, if the wheels are straight, the knob will be at the lowest point in the periphery of the wheel; turning the steering wheel so that the white knob is either to the right or the left, indicates in which direction the wheels are pointed and approximately their angularity. The usefulness of the device is apparent in garage maneuvers when the fenders obscure the wheels. A piece of string tied around the steering wheel, or even a small nick filed in it, would serve the same purpose and probably would save much confusion and prevent the car being damaged.

Car that Aids Sale of Cash Registers.

The enterprise which has characterized the National Cash Register Co., of Dayton, O., and which has given the sales force of

that company an enviable reputation, has found further field for operation in the designing of a motor car which is especially equipped for use by the cash register salesmen. The car is a Republic roadster of standard chassis, but upon the rumble deck is bolted a trunk capable of containing the largest size of register made by the company, as shown by the accompanying illustration. Beneath the trunk is a drawer four inches deep in which advertising matter may be carried. Under the front seat is a drawer for the automobile and cash register tools. With this equipment the merchant to whom access is difficult is no longer immune from the invasions of the N. C. R. salesmen.

Safety Spark Gap May be Abused.



Although the safety spark gap in a magneto is put there for a definite purpose, which purpose is to protect the comparatively delicate windings of the instrument in the event of short circuits or broken high tension wires, the spark, nevertheless, should not be permtited to cross this gap for any length of time if it is avoidable. The high tension spark is a hot spark and it tends to burn away the terminals. If the terminals are burned away ever so slightly, the safety spark gap will be too wide properly to fulfill its mission in life.

NO RADICAL FEATURES IN SELDEN TRUCK DESIGN

New Vehicle for Which Easy Payments Will Be Accepted Is Standard—Long Stroke Block Motor Employed.

Unusual interest attaches to the new Selden truck, manufactured by the Selden Motor Vehicle Co., of Rochester, N. Y., and sold by a separate organization, the Selden Truck Sales Co., if for no other reason than that it is the first commercial vehicle to be built by the Selden company and the first that has been offered by a well known concern on the easy payment plan; moreover, the vehicles are sold direct from the factory without the intervention of the usual agents, which is another innovation of more than passing interest.

NEW SELDEN ONE-TON TRUCK EQUIPPED WITH PLATFORM STAKE BODY

Following well established precedent, but one model will be turned out, the policy of the makers being the concentration of energies on a single type. The new Selden truck has a carrying capacity of one ton and is propelled by a four-cylinder motor rated at 23 horsepower. Left-hand steer, center control and a governor which limits the road speed to a maximum of 16 miles an hour are among the features of the car.

The frame is low hung, and when the truck is carrying its normal load is only 29½ inches from the ground. As the wheels are 36 inches in diameter, the frame is below the tops of the wheels; if the body is carried directly on the frame its maximum width outside is 46½ inches. By using a 3-inch bolster or sub-sill to raise the body above the level of the driving chains the maximum width can be increased to 52½ inches, while a 10½-inch bolster will raise the body high enough to clear the wheels under all conditions, so that it can be made of any width desired. The length of the loading space normally is 8 feet 6 inches.

In the construction of the motor the unit power plant plan has been adopted, the gearcase being bolted to the rear end of the crankcase. The cylinders, which are block cast, have a bore of 3¾ inches and the piston stroke is 5¼ inches; this long stroke is considered especially advantageous in commercial motor vehicles because of its efficacy in making hard pulls at low speeds. Under the control of a sealed governor the motor has a maximum speed of 1,150 revolutions per minute, which corresponds to a road speed of 16 miles an hour on the high gear. A dual ignition system is employed, a peculiarity of which is that the magneto is driven at the same speed as the crankshaft. A positively driven gear pump circulates the cooling water through a vertical tube radiator.

Transmission of power is through a multiple disk clutch, three-speed gearset and jackshaft, with side chains for final drive. The gearset provides for three speeds forward and the usual single reverse, selectively controlled; gears and shafts are of heat treated nickel steel and the shafts run in Timken roller bearings. The clutch is of the dry disk type. There is a single universal joint in the short shaft between the tail-shaft of the gearset and the jackshaft. Special construction has been employed to make the binding or straining of the jackshaft in its bearings a practical impossibility in case of the distortion of the frame due to abnormally rough roads. Spherical boxes are mounted in spherical sockets on the frame, and the boxes carry the Hyatt roller bearings in which the jackshaft runs. Frame twisting can have only the effect of turning the spherical boxes slightly in their sockets, permitting the roller bearings to adjust themselves accurately and automatically to the changes in the relative positions of the frame members. The differential on the jackshaft is of the approved bevel gear type; drive shafts, of heat treated alloy steel, are 1⅜ inches in diameter.

Both front and rear axles are steel forgings, heat treated. The front axle is of the familiar I-beam cross section, 3 inches deep and 1⅜ inches across the flanges, with a web thickness of ⅜ inch. The rear axle is a solid rectangular forging 2¼ inches deep and 2 inches thick. There are 12 2-inch hickory spokes in each of the 36-inch artillery wheels; solid rubber tires are used all round, 3½ inches wide in front and 4 inches wide on the rear wheels. All rims are S. A. E. demountable. The tread is 56 inches for the front wheels and 60 inches for the rear wheels, and the wheelbase is 125 inches.

A good, substantial depth of 5½ inches is a characteristic of the pressed channel steel main frame, which is designed to carry real loads. The front cross member is detachable, so that the unit power plant can be removed bodily in case of emergency, to the great facilitation of repair work. The rear end is protected by a stout steel bumper. Ample length, as well as ample weight, is given to the springs, and the car should be an easy riding one for its kind. Front and rear, the springs are semi-elliptical; in

Digitized by Google

front they are 42 inches long and 2¼ inches wide and in the rear 48 inches long and 2½ inches wide. No driving stresses are transmitted through the springs, heavy radius members being provided to take the thrust.

Worm-and-nut steering gear is employed, with a hand wheel 18 inches in diameter; this gear is, of course, irreversible. Gasolene is carried in a drawn seamless steel tank, tinned inside and out, located under the driver's seat, having a capacity of 23 gallons. Without load the car weighs 2,900 pounds. The price is $2,000. The equipment consists of a horn, three oil lamps, jack and set of tools.

Blocking out Clutch to Avoid "Freezing."

If a car is to be allowed to stand idle for more than a month it is a wise plan to block out the clutch by inserting a piece of wood between the pedal and the heelboard, and thus prevent it becoming frozen." The pressure of clutch springs varies, and what may appear to be a "soft" spring in reality may be the very reverse, as the question of leverage of the withdrawal gear may deceive the operator.

First slack off the spring and then insert a piece of wood of suitable size. If this is not done, the clutch may "freeze up" during the period of idleness. This is particularly true of dry plate clutches and plate clutches in general. Leather cone clutches have been found to suffer through having a rib formed on the outside edges preventing the total engagement. If leather clutches are blocked out a good soaking with pure castor oil will tend to restore life to the fibers of the material, care having been taken first of all to wash away any foreign matter with gasolene

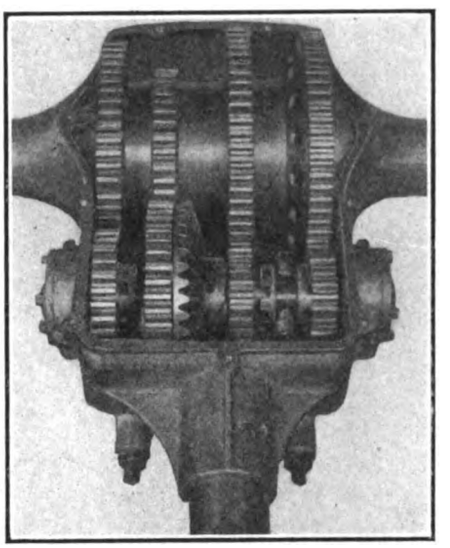
Long Plugs for Hard-Starting Engines.

A motor that is difficult to start sometimes can be made an easy starter by using long spark plugs which will cause the spark to occur deep in the mixture in the combustion chamber. Care should be taken that the plug does not interfere with the piston head, if the clearance is small.

Simple Lock Washer for Temporary Use.

A lock washer that will work fairly well for a short time can be made of a common iron washer by making a number of radial cuts in it with a coldchisel and also nicking the bottom of the nut. This is merely a temporary expedient, however.

Effect of Quenching Heated Metals.



Steel and brass are affected oppositely by heating and sudden cooling in water. Steel is hardened in this way, but brass is made softer, as is also copper and German silver.

COMBINED AXLE GEARSET WITHOUT SLIDING GEARS

Dog Clutches That Make for Quietness Feature of Bennett's Device—Case-Hardening Obviated by Position of Pinions.

The trite old saying to the effect that in the making of books there is no end might almost and with equal aptness be applied to the construction of change gear mechanisms; for there are few who are entirely satisfied with the present types of sliding gearsets, despite their satisfactory operation in most hands.

The Bennett rear axle gearset which is illustrated herewith, and which is the invention of Stephen S. Bennett of 216 Fairview avenue, Chicago, Ill., represents the latest development and, unlike many others, it would seem to hold real promise, for it not only works, and works well, but is comparatively cheap to manufacture and presents few engineering difficulties. The device, incorporated in a Packard car, was demonstrated to a Motor World man, and during the course of the demonstration it was made very plain that it not only is feasible and quite easy to change from any gear to any other gear while the car is running, but that the operation is noiseless. Which, briefly, is the principal claim made for the device by its inventor, this and other claims being covered by letters patent numbered 1,014,036.

BENNETT'S AXLE GEARSET

The general design of the device may be seen from the accompanying illustration, which shows that the whole gearset is incorporated in the rear axle housing with the differential mechanism, and is not, as is the case with so many other axle gearsets, contained in a separate housing bolted to the differential case. Its comparatively small size, which, of course, also means light weight, accounts for its construction. The driving gears, which are four in number, are mounted loosely on a transverse shaft and are constantly in mesh with the driven gears, which are solidly keyed to the driving axles through the intermediary of the differential mechanism. By reason of the fact that the gears always are enmeshed, there can be no clashing and wear when speeds are changed, all the wear coming on individual dog clutches. These clutches are shifted by means of the orthodox side hand lever and serve to key their individual pinions to the transverse shaft, which is driven by means of the usual bevel gears.

It is pointed out by the inventor that as all the drum or driven gears are considerably larger than the driving gears, the strain and wear between them is equalized to a greater extent than it is in the usual gearset and that the resultant drive is much akin in effect to the drive by side chains. Incidentally, as the driven gears are behind the driving gears they quite naturally rotate at speeds one-third to one-fourth less, depending on the gears in use, than the peripherial speeds of ordinary gear wheels in the usual gearset. One of the features that would seem to bear out the inventor's contention that wear is much less with his gearset than it is with any other of the ordinary pattern, is the fact that they are not case-hardened, he points out, reduces considerably the cost of manufacture. Summarized, in the words of the inventor, the advantages of the gearset are: Increased durability, increased simplicity, greater ease of operation and low cost of manufacture.

Why Radiator's Water Should be Changed.

Everybody knows that water pours more freely than molasses, but few motorists from one year's end to the other think of drawing the water from the cooling system. Unless cleaned periodically locomotive boilers "furr up," and the cylinder jackets of the gas engine, as well as the radiator and water pipes, are affected in a similar manner. The rubber hose connection becomes rotted inside, and cases are not hard to find where these burst, simply due to rot. Radiator bases readily adapt themselves as receptacles for mud, and instead of a free passage for the water to flow, the chambers become constricted, throwing an unnecessary amount of work on the pump, if such is used; or, in the case of thermo-syphon cooling, minimizing the efficiency by 30 to 50 per cent. Before using anti-freezing solution a thorough cleaning of the circulation system is necessary.

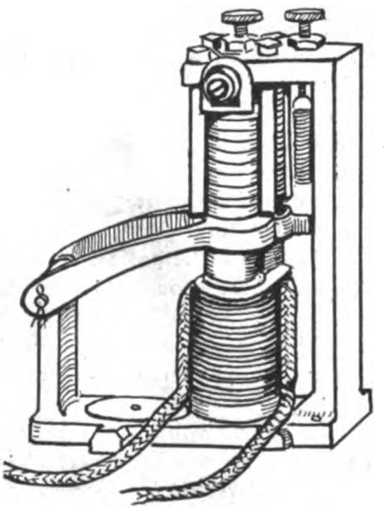
ELECTRIC LIGHTING SYSTEMS—THEIR WORKINGS

Use of Combined High Tension Magneto and Generator Explained—Magnetic Regulator and Its Function—Locating Possible Causes of Trouble—Excessive Current Obviated by Fuses.

(This is the fourth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by dealer and owner alike.)

It is altogether probable that if the old methods of ignition of automobile engines by means of hot tubes and other equally crude and objectionable systems still obtained, electric lighting systems still would be a dream of the future. But with the development of ignition systems to their present state of high efficiency, it has been demonstrated that electricity can be put to many other uses as well, and it scarcely is less the necessity for electricity for ignition than it is the convenience and dependability of electric lights that has within the past few years so stimulated the development of lighting systems.



Idea of Complexity Exploded.

The continued success of the high tension ignition system, in the face of one-time criticisms to the effect that its complexity would serve as an effectual bar to its general adoption, has served also to demonstrate that, after all, electricity is not such a terribly mysterious and subtle fluid and that, with the help of even average intelligence, its way can be made the will of whosoever wishes. All of which has been made very plain in the three preceding articles which have appeared in Motor World, and in which have been laid bare the secrets and "mystery" which is no mystery at all, of a number of modern electric lighting systems.

Double Purposes That Are Served.

As has been explained, high tension current and low tension current are quite different in their characteristics. High tension current is used for ignition purposes only—low tension ignition of automobile engines being practically obsolete—and is low tension current "stepped up" by means of a transformer until its voltage is very high, though its amperage is so low as to be scarcely measurable with ordinary instruments. Low tension current is the base which invariably is used in producing high tension ignition current. In many of the modern magnetos the transformer coil is incorporated directly in the instrument, which thereby becomes to all intents and purposes a high tension instrument. In others, the transformer coils are located in a box on the dash with the contact breaker and the distributing mechanism on the magneto, and these also are styled high tension instruments, though in any or all of them low tension current must first be generated.

Of course, where an electric lighting dynamo forms part of the equipment of a car it is a simple matter to utilize some of the current generated for ignition purposes by the simple expedient of passing it through an individual induction coil and a distributer. So far as is known, however, there are only two manufacturers who attempt to combine the high tension magneto and the lighting generator in the one instrument, which is complete in itself, together with a suitable dash coil, for either purpose. Of these two, only one, the Remy Electric Co. of Anderson, Ind., is an American manufacturer regularly engaged in the production of instruments for the market. The other, which is the British Simms company, is a foreign firm that has developed a combination instrument utilizing two separate and distinct armatures rotating within the same field, one armature for the ignition circuit and the other for the lighting circuit.

REMY MAGNETIC CONTROL

Regulation Effected by Combined Fields.

The Remy instrument truthfully may be styled a combined high tension magneto and low tension lighting dynamo. The low tension current is generated in a drum-wound laminated iron core armature rotating in a field composed of permanent magnets supplemented by an electro-magnetic field formed by a shunt field winding around the permanent magnets. The magneto portion of the instrument is orthodox in every particular and consists of the usual contact breaker and distributer gear attached directly to the magneto and actuated by the armature shaft. The transformer coil is located in a coil box on the dash.

In the lighting portion of the instrument the initial current is generated by the armature rotating in the field of the parmanent magnets. As the current strength increases, part of it is passed through the shunt winding, thereby strengthening the field and thus increasing the current output. The method of regulating the output is ingenious and consists of varying the strength of the shunt field through the action of a magnetic regulator formed of an armature, a coil in which the armature operates, and a pile of carbon disks one upon the other. When the engine is idle, the pressure upon the carbon disks is such that they become virtually a solid conductor, permitting all the current to pass through the shunt field.

Carbon Disks Control Field Strength.

As the speed of the dynamo armature increases, however, the electro-magnetic regulator, which is connected in series with the shunt field, decreases the pressure on the carbon disks, and as they loosen, under the action of a spring, their resistance becomes greater and the strength of the shunt field is decreased. In action, the regulator is automatic and compensates for engine speed fluctuations by maintaining the magnetic field of the dynamo constant so that the current output of the machine never exceeds eight amperes. The same device—it is mounted in the coil box on the dash, where it is instantly accessible—also serves to disconnect the generator from the battery immediatealy the engine is stopped, in which case the lighting load automatically is taken up by the storage battery, which in the lingo of electrical engineers is "floated on the line."

Simplicity a Characteristic.

Despite the manifold functions of the Remy instrument, it is little, if any, more complicated in structure than any other lighting dynamo, and its installation and

Digitized by Google

care require no special knowledge of electricity. The instrument is designed to be run in either direction—clockwise or anti-clockwise—though when it is run clockwise the green-red "jumper" wire should be connected to the brush holder marked No. 1 and the red "jumper" wire to brush holder No. 2. If it is to be run in anti-clockwise direction the connections should be reversed. It is difficult to conceive that trouble with the wiring connections could manifest itself, for with each instrument is supplied a complete wiring diagram on which the various wires are marked in color to correspond to the color of the wires themselves. It is merely necessary to connect the colored wires to the terminals indicated on the wiring diagram.

Attention That Nets Perfect Results.

Failure to generate could only result from improper wiring connections or a poor condition of the brushes or commutator caused by wear or lack of proper lubrication. Occasionally the commutator should be cleaned by pressing very fine sandpaper lightly against it, and it will do no harm to apply a minute quantity of good quality vaseline to it while the instrument is running. No oil should be used on the commutator nor should the usual lubricating greases be used upon it. As a last final injunction, it is absolutely essential that a storage battery be used with the instrument. The instrument cannot be used without one, and only the battery specified by the Remy company should be used, for repeated tests have shown that only one style of 6-volt 120-ampere hour capacity lead plate battery can be expected to give good results.

In the Remy system the current output is controlled by means of a mechanical regulator, and a somewhat similar mechanical device is employed in the Adlake system, which is manufactured by the Adams & Westlake Co., of Chicago, Ill., though the dynamo and, in fact, the whole system, is entirely different in theory. The Adlake machine is a straight shunt-wound dynamo in which permanent magnets find no place. The field pieces are electro-magnets.

How the Adlake System Differs.

The complete system includes the dynamo, the Adlake-Newbold regulator, which governs the dynamo output, and a storage battery. In general construction, the Adlake dynamo differs somewhat from other dynamos, though its component parts are the same and in general the same instructions regarding upkeep apply to it as apply to others. By simply removing a small wing nut the aluminum cover may be removed, disclosing the interior mechanism and the brushes, holders and commutator. The brushes, it may be noted, bear on the commutator at a slight angle favoring rotation, and in removing and replacing them care should be taken to see that they are put back properly, or damage to the commutator will result.

In caring for the dynamo, it is well occasionally to wipe out the inside of the case with a clean cloth moistened with gasolene. The brushes also may be removed and cleaned, though if they have been run for some time their adjustment should not be altered for the reason that they are self-hardening with wear, and after a short use the springs seldom, if ever, require adjustment. The same cloth will serve to remove such dirt as may have collected on the commutator. The commutator should present a smooth, hard surface of a dark brown color when in the best of condition, and if it should show signs of scratching or pitting, such marks should be removed by holding fine sandpaper against it until they disappear.

Brush Adjustment an Important Point.

Naturally the brushes will wear out in time, and when they so they should be renewed. When the tension levers commence to touch the box in which the brushes slide, it is time to put in new brushes. The machine should not be run as long as it will run and generate current without attention to the brushes, for the greatest damage is done to commutators when the brushes are just too short to make perfect contact and still are not short enough to prevent the generation of current. When they are in this condition they cause undue sparking, and as a result the commutator wears rapidly.

The current and voltage regulator is an ingenious device, which, nevertheless, is quite easily understandable in construction and operation. Mounted on the same panel with it is the automatic circuit breaker, and this also is ingenious in conception as well as positive in action. Briefly, the circuit breaker consists of two pairs of coils, one pair shunt and the other pair series. As the speed of the dynamo armature increases and the current strength becomes greater, the shunt coils are energized sufficiently to lift an arm, thereby connecting the dynamo to the battery. As the current flows from the dynamo to the battery it passes through the series coils, causing a greater pull upon the arm and making the contact still more effectual. At the instant the battery current becomes stronger than the dynamo current—when the dynamo armature speed is reduced as the engine is slowed down—the current backs up in the series coils of the circuit breaker and causes the arm to drop, breaking the circuit.

The regulator consists of a solenoid actuating an arm carrying a contact bearing on a series of other contacts, and operating through the resistance of a variable dashpot. The solenoid coil is placed in series with the field of the dynamo and, as the armature speed increases, more current is passed through the solenoid, which responds by pulling the contact bearing arm across the permanent contacts and thereby inserting steps of resistance in the dynamo field. In this way, the output of the dynamo is maintained constant regardless of the speed of the armature. By varying the weight of the piston in the dashpot against which the solenoid works, the current output of the generator can be varied within certain limits. There is a small cover over the dashpot, which, if removed, reveals a small cavity in the piston, which is partly filled with bird shot. Increasing the weight of shot increases the current output of the dynamo, for the reason that more magnetism then is required for the solenoid to lift the weight, and before the magnetism can be increased the dynamo output must be increased. In practice, however, just the reverse obtains. That is to say, altering the adjustment of the regulator automatically alters the output of the generator.

Care of Component Parts.

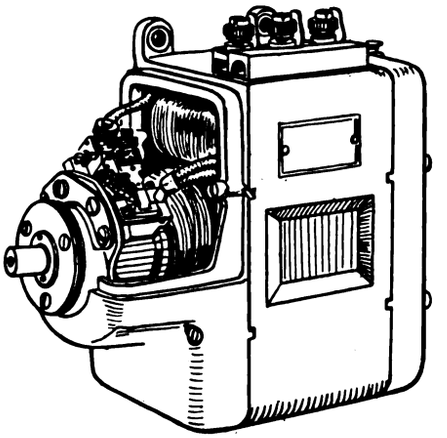
In caring for the regulator, the segments against which the sliding contact bears should be kept clean and bright and the spaces between them should not be permit-spaces between them should not pe permitted to fill up with dust and dirt. The movable brush should press firmly against the segments, and not more than one drop of oil may be placed on the pivoted bearings of the wheel about once in six months. One of the sure signs that the apparatus is working properly is that the arm will move up and down with variations in engine speed.

Functions of Fuses Made Plain.

Throughout the system, protection against short circuits is provided by means of fuses, and in case of failure to generate these always should be examined first to make certain that they have not "blown out." Of course, if they have "gone," current will not pass until they have been replaced with new ones. The reason for the fuse "blowing out" should invariably be discovered before a new fuse is inserted, for the fuse is a safety valve and serves as an indication that something is wrong. If the regulator arm should stick and the device become inoperative, permitting a very heavy current to pass to the battery when the engine runs at high speed, the main fuse will "blow." It is put there for that purpose. Or, if the automatic circuit breaker should fail to break the circuit between the dynamo

Digitized by Google

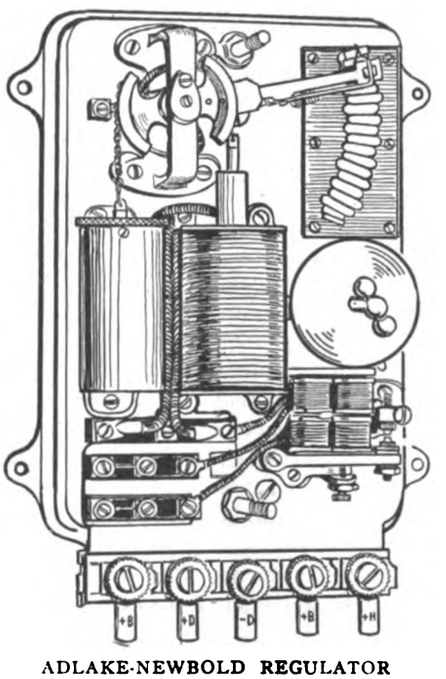
and the battery when the engine stops, then the field fuse will "blow." The dynamo may fail to generate sufficient current because of the failure of the brush on the regulator arm to press properly on the segments. This would permit the resistance to remain in the field circuit all the time. Naturally, loose connections or a broken wire also will manifest themselves in a failure to generate or failure properly to light the lamps.



Protection That Fuses Afford.

By reason of the design of the system it is virtually self-protecting through the fuses. It is very unlikely that trouble of any kind will develop which will do other than cause the system to fail to generate current and thus allow the battery gradually to discharge itself. If, for instance, one of the wires to the battery should become loosened or broken, the regulator would become inoperative and this, in turn, would result in a heavy current being passed through the field fuse, which, of course, would "blow," thus protecting the dynamo. If the lights were connected they would flicker badly, due to the changes in armature speed, the output of the dynamo then being uncontrolled. Thus it may be seen that one kind of trouble almost invariably brings on another and that all trace upon the original one. It should be a simple matter to trace out the original fault and, once remedied, its location will serve as a guide in making subsequent searches. One of the principal points to watch in the Adlake system is the regulator arm. If this is kept in an operable condition through occasional inspection and attention the system will work properly and there is little reason to expect any great amount of trouble.

To those who have the courage to look the situation squarely in the face, without peering through a purely hypothetical fog raised by themselves alone, trouble must appear to be spelled "i-g-n-o-r-a-n-c-e." And though it has been said that a cobbler's children are always the ones whose shoes are down at heel, despite their father's intimate knowledge of the repair of shoes, at least the cobbler knows the parts that are most likely to wear and he can provide against it. Anyway, he can repair such breaks as occur. It is very much the same way with the modern lighting system. It is "O. K." when it comes from the manufacturer and it will stay "O. K." if it is properly installed and intelligently cared for. But—it can no more be properly installed than it can be intelligently cared for unless its construction is known.



Similarity That Should Assist Learning.

Fundamentally, all systems are all very much alike. To know one almost is to know them all, though each has its peculiarities and each requires separate treatment to make plain its distinctive features. Still,

ADLAKE DYNAMO CONSTRUCTION

there are so many systems, and there is such very great variety in the method of establishing the proper relationship between the various component parts that it

ADLAKE-NEWBOLD REGULATOR

is beyond the scope of a single article to treat of them all.

Seeks to Assist the Breather Pipe.

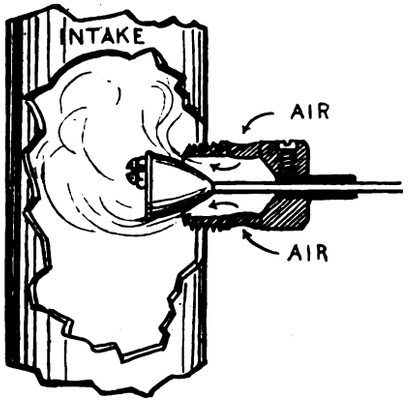
Regardless of the popular assumption that the pressure in the crankcase of a four-cylinder four-cycle engine is no pressure at all, but is equalized through the "balancing" of the pistons, such is not the case, as a superficial examination of the conditions obtaining will make plain. Owing to the obliquity of the connecting rods during certain portions of the cycle, the pistons do not move up and down at equal speeds, and as a result the pressure in the crankcase is alternately slightly higher and slightly lower than atmospheric pressure, which fact is demonstrated by the alternate puff and suction at the breather pipe.

The breather pipe is put in an engine in order to permit this pressure to be equalized in so far as is possible, but that it serves its end with but mediocre results at best is the contention of a British expert who has developed what he styles a "vacuum suction valve" for insertion in the breather pipe. According to the theory of the device, which theory, it appears, will stand investigation, the "vacuum suction valve" operates to permit the increased pressure to escape but does not permit air to be drawn in through the breather pipe. As a result a partial vacuum is formed in the crankcase, and instead of the lubricating oil being forced out through bearings and valve tappets, the vacuum tends to draw it in and in this way to keep the engine clean and free from accumulations of road dust and dirt.

Measuring the Diameters of Tires.

Despite the widespread use of tires, there still exists confusion regarding manufacturers' methods of designating tire sizes. Briefly, a 36 x 4 inch tire, when fully inflated, measures 36 inches in diameter outside the casing between the point of road contact and the uppermost side of the tread. The sectional measurement—4 inches—also is taken to mean the actual distance between the outermost points in a section. Such measurements vary considerably, however, in the products of different manufacturers, which may perhaps account for the confusion that obtains. Thus, for instance, though tires seldom, if ever, are undersize, not a few makes are slightly oversize, and consequentiy their measurement cannot be expected to correspond exactly to the dimensions stamped on the tire. Diameter measurements never are taken at the felly band of the wheel, as sometimes is supposed to be the case.

Extemporizing a Pressure Feed System.



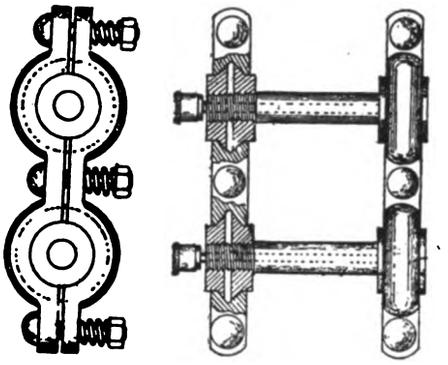
In the event of the exhaust pressure device in a pressure feed system becoming inoperative, and provided that the hand pump also is out of order, it still is a comparatively simple matter to raise sufficient pressure in the tank to start the engine. If the exhaust pipe is carefully plugged and the engine "spun" for about a dozen revolutions with the throttle wide open it then becomes an air compressor and compresses the air drawn through the carburetter in the exhaust pipe, the air first having passed through the intake and exhaust valves. The pressure in the exhaust pipe will be raised sufficiently to operate the exhaust pressure device and the air will pass through into the tank.

Digitized by Google

Saunders Auxiliary Air Valve.

While simplicity is desirable in any mechanical device, it is especially important in auxiliary attachments, which are not part of the ordinary equipment of a car but are intended to be applied as extras. The fact that there are but two main parts to the Saunders gasolene saver is, therefore, a point very much in its favor. The attachment, which is the product of the Leslie R. Saunders Co., of 927 West Seventh street, Los Angeles, Cal., is of that type in which the mixture of gasolene vapor and air can be controlled as to its proportions by means of the auxiliary air valve, opening into the intake pipe, controlled from the driver's seat.

The valve itself is a simple brass cylinder in which are four air holes, and in it a conical plug which can be moved by means of a Bowden wire attached to the valve stem with an operating lever on the



SAUNDERS GASOLENE SAVER

steering wheel column. By opening the valve the proportion of air in the mixture is, of course, increased and at the same time the mixture is made more intimate by the mechanical agitation resulting from the impact of the two currents coming together at right angles. The mixture can be made exactly right for the momentarily existing conditions, even if the carburetter does not give just the right mixture. With the throttle closed and the air valve open the cylinders will draw in pure air when the car is coasting, and by allowing air to be drawn in when stopping the motor the operation of a motor starter of the gas type is made more positive than if the cylinders contained an uncertain mixture of gas. The method of attaching the valve is as simple as the valve itself.

Spring Shackle That Absorbs Shocks.

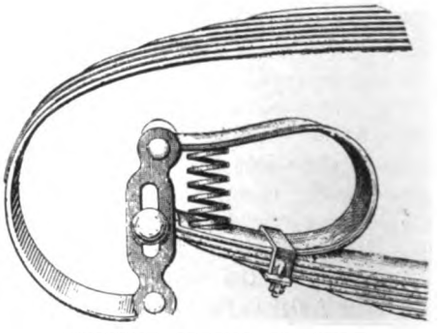
To make one part or mechanism perform the functions of two and thus do away with superfluous parts has been the object of not a few motor car designers and not a few interesting devices have been the fruit of their labors. Recently the Cleveland Car Co., Ltd., Darlington, Eng., has placed on the market a new form of spring shackle which not only performs all of the duties of the older forms of such devices, but acts as a shock absorber as well. The device, as shown in the accompanying drawing, consists of the usual bolts which protrude through the eye in the end of the spring and the frame bracket, respectively. However, these bolts bear at either end short

CLEVELAND SHOCK ABSORBER

double cones. The links, which are split and "V-grooved" to fit over the cones, are bolted together by means of a trio of bolts provided with short but "stocky" helical springs, which squeeze the two halves of the links together with cones between them. Obviously, the friction between the cones and the links can be increased or decreased by altering the tension of the springs and the damping effects of the shock absorbing shackle altered to suit requirements.

"Creeper" That Facilitates Under-Car Work.

There is nothing that is much less inviting than the prospect of having to lie under a car when the garage floor is in the usual state of ooziness and dirt, to say nothing of its chilling temperature and dampness in cold weather. Too often the cushions of the car are used for the protection of the unfortunate worker, with dis-



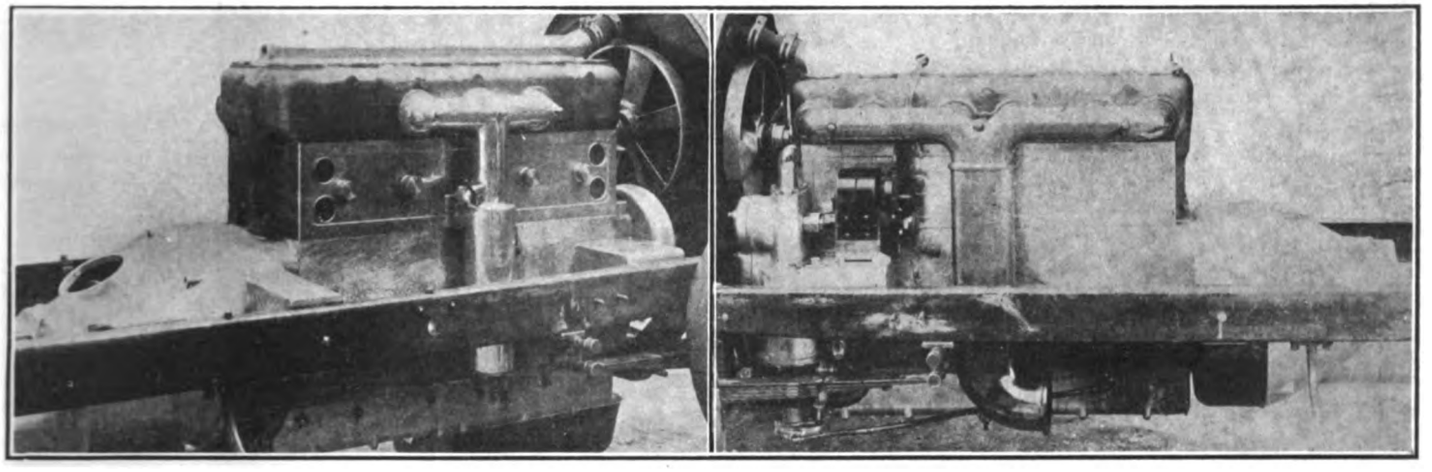
KEYSTONE SHOP CREEPER

astrous effect on the cushions. All such troubles are overcome and the comfort of the worker and his ability to do his work satisfactorily greatly increased by the use of the so-called "creeper," which consists of a very low castor truck upon which a man can lie. The one shown in the accompanying illustration, which just has been placed on the market by the Keystone Wire Matting Co., of Beaver Falls, Pa., is made of neatly finished hard wood, and is mounted on 1¼ inch steel wheels or castors running on ball bearings, so that shifting positions is an easy matter. The whole creeper is substantially built for hard service, being designed with every-day garage work in view.

Combining Shackle and Shock Absorber.

To permit free spring action at the time that the wheels are passing over rough places in the road, and to limit the spring action, or, in other words, to "choke" the rebound of the springs after obstruction has been passed over, is the object of a combined spring shackle and shock absorber of which A. P. Vincent, of Paris, France, is the inventor. As shown by the accompanying illustration, the device is charmingly free from complication. The links which connect the ends of the springs are slotted, and through the slots passes the bolt which fastens the links to the end of one of the springs. On the end of the lower spring, which is fastened to the shackle in this manner, is mounted a looped piece of

VINCENT SPRING SHACKLE



spring steel which is provided with an eye in the upper end, through which passes a bolt which engages with the upper holes in the links. Between the turned-over ends of the looped spring is mounted a short helical spring made of square wire. The upper spring is fastened to the links in the usual manner, with a bolt which passes through the holes provided in the links and through the eye in the end of the spring. The combined action of the looped spring and the short but strong helical spring supports the weight of the car when things are normal, and the bolt which passes through the slots in the links takes a central position. When, however, the wheels meet an obstruction, the bolt approaches the top of the slot and, if the shock imparted to the wheels by virtue of the speed of the car and the height of the obstruction is great enough, the main springs come into action when the bolt reaches the uppermost position. The recoil of the main springs is hindered by the bending action of the looped spring, which latter is held in position by means of a bridge clamp in the manner shown.

UNUSUAL CONSTRUCTION IN "HIGHEST PRICED" MOTOR

Simplicity and Accessibility Paramount Features of Julian Engine —Has Six Cylinders and Long Stroke.

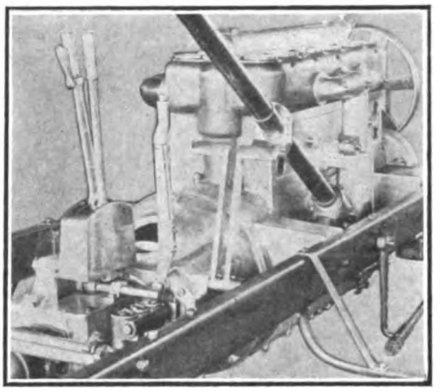
Although the design of the poppet-valve automobile engine has become almost thoroughly standardized through years of constant application, its construction and the methods of manufacture and the materials of which it is constructed are by no means standard. In these respects, the Julian Motor Co. of Syracuse, N. Y., though not attempting standardization in any form, would seem to have made a long step forward in both design and construction, for in the six-cylinder Julian motor, which shortly will be placed on the open market, the manufacturers have adhered very little to even such set practices as have become fairly common and instead have been active in seeking out brand new designs, new materials and new methods of construction. The concrete result is an engine which embodies the best points of the best designs, though at the same time it differs very greatly in many respects from the ordinary automobile engine.

INTAKE AND EXHAUST SIDES OF JULIAN MOTOR, SHOWING MANIFOLD CONSTRUCTION AND COMPACT DESIGN

As a matter of fact, the Julian engine is not an ordinary engine in any sense of the word; it really is extraordinary in both its design and its construction, though the plans that have been laid down are not such as to engender the slightest feeling of unrest regarding the operation of the completed machine. In developing the motor, accessibility has been the keynote of the design, and it is noteworthy that the theory behind the design has been adhered to even to the extent that the draughting room has been permitted to dominate the production department. In other words, no expense has been spared, either in design or construction, to make the motor as nearly perfect as human ingenuity and labor can be expected to make it, and as a result it is freely admitted by the manufacturers that the engine will bear the distinction of being the highest priced stock automobile motor either in the United States or abroad.

In conformity with the general tendency toward long strokes, and also to obtain the degree of flexibility and smoothness in operation which that type of motor permits, the stroke and bore ratio has been made fairly high. The bore is 4½ inches and the stroke is 7 inches, the ratio therefore being 1.55 to 1. The nominal horsepower rating is 48, though by reason of the valve design and the shape and construction of the intake and exhaust manifolds which have been designed to obviate the slightest possibility of "loading up" or choking, well over 100 horsepower is given off at 2,200 revolutions a minute, this figure having been obtained through an actual block test. At present the motor is constructed in only one style — six cylinder — though production plans anticipate the early addition of a four-cylinder model which will be practically a duplicate of the "six." The cylinder dimensions will be 3¼ x 6 inches.

In the six-cylinder model the cylinders are cast in a single block which is very nearly rectangular and is singularly free from projections. Both the intake and the exhaust manifolds have been made as short as is consistent and set close to the casting. The valves and the valve arrangement are peculiar and the design of the mechanism is distinctive. The valves themselves are exceptionally large, the heads measuring 3 1-16 inches in diameter, and the stems, which are no less than ½ inch in diameter, are hollow. The valve seat angle is 30 degrees, thereby providing, with ⅜ inch lift, a slightly larger opening than ordinarily would be possible. The valve heads are nickel steel welded to carbon steel stems. The push rods also are hollow, in order to obtain lightness, and instead of being round, as is the usual practice, they are made square. By way of ensuring perfectly accurate fit the push rods are subjected to no less than four processes before final assembly. They are first rough broached, then machine broached, then hand broached and then lapped in by hand. Quietness in the valve action has been obtained by preventive rather than by remedial methods. On the top of each push rod there is a tiny dash pot formed of a tight fitting metal cap which is ventilated at the sides. The effect of the dash pot is to prevent the valve stems from jumping and also to ensure positive lubrication of the lower ends of the stems.



As an indication of the length to which accessibility has been carried, the camshafts, which are exceptionally heavy and are carried in bearings that are unusually liberal, may be removed from the front end without the necessity for disturbing the bearings or any of the other mechanism of the motor. The camshaft bearings are lubricated by means of small wells which are cast in the crankcase immediately above each bearing. They are kept full by splash, and the bearings thus are ensured of continual lubrication. Additional cams on the shaft, much smaller than the valve actuating cams, serve to raise the valves slightly and thus reduce the compression when the camshaft is moved forward bodily by means of a lever provided for the purpose. The whole valve mechanism is completely housed by means of two tight aluminum plates which extend the whole length of the crankcase and are held in place by means of thumb screws. The screened holes in the plates, visible in the accompanying illustration, serve to admit the air to the carburetter. As the air must pass nearly the length of the motor before it enters the carburetter it is effectually warmed and the homogeneity of the mix-

Digitized by Google

ture is ensured without the necessity for water jacketing the carburetter.

Despite the size of the motor and the length of the stroke, the connecting rods are exceptionally light. They are of I-beam cross section and weigh, complete, just three pounds. The pistons, which are 6½ inches in length, also are very light, one piston with its wrist pin, complete, tipping the beam at 4¾ pounds. Each piston is fitted with three concentric piston rings and provided with several oil grooves which facilitate lubrication and reduce the tendency to smoke. Lubrication is entirely by splash, the connecting rod big end bearings dipping into small troughs which are fed from a reservoir in the crankcase. Small holes in the center of each trough maintain the oil at the proper level for normal motor speeds. As the speed is increased, however, the amount of oil fed into the troughs is too great to pass through the holes in the interval of time between the piston strokes, and consequently the supply of oil is increased. Baffle plates in the bottom of the crankcase prevent the front or the rear cylinders getting too much oil when the car is ascending or descending a grade, as the case may be. The several troughs are constructed in a unique manner that makes cleaning an easy operation. By simply removing two plugs, one at either side of each trough, a brush may be inserted and the whole interior swept out.

Cooling is effected by pump circulated water, the pump being located at the forward end of the casting on a vertical shaft, the lower end of which serves to actuate the oil pump. By reason of the proximity

JULIAN MOTOR IN PERSPECTIVE

of the pump to the casting, intake water pipes are unnecessary, the pump being connected directly to the jacket. The return water pipe is enclosed in an aluminum housing on top of the cylinders. A six-blade cast aluminum fan serves to induce a draft through the radiator.

The flywheel is housed in an integral extension of the crankcase and the clutch housing, enclosing a multiple disk clutch composed of 13 Raybestos faced and 14 saw steel plates, is bolted directly to the flywheel. The motor is supplied either with a change gear mechanism and control levers or without these parts. When a gearset is supplied it may be either three or four speed. Similarly, in the equipment of the engine the option is given of either an electric or a compressed air starter. The engine which is illustrated is equipped with the air starter. The system consists of a three-cylinder combination air motor and compressor and a tank. When the motor is to be started the compressor becomes an air motor, geared 17 to 1, and operates through the gearset, pressure being supplied from the air tank.

By way of emphasizing the extreme simplicity and accessibility of the motor, it is pointed out that through the whole construction but two sizes of nuts and bolts are used, thus reducing the requirements of the tool kit to but two wrenches. Another detail which is indicative of unusual attention to detail is the construction of the starting crank. The crank is mounted on a tapered shaft and its position may be shifted to any position relative to the compression stroke for easy starting.

AMERICAN CARS PROMINENT AT MELBOURNE'S FIRST AUTOMOBILE SHOW

Diversified Display of Products of Eight Different Nations, England and the United States Leading—Few Exhibits of Commercial Vehicles—Thirty-two Exhibitors Show Eighty-four Different Makes.

For a new institution, the Victorian Automobile Show, staged in the Exhibition Building, Melbourne, Australia, during the week of August 31 to September 7, under the auspices of the Automobile Club of Victoria, Ltd., loomed large. In all there were 84 different makes of pleasure cars exhibited by 32 exhibitors; also 10 commercial vehicles were displayed. Of the pleasure cars, 18 were of American manufacture; most of the others came from Great Britain. But one American commercial car was shown—a Sampson truck.

While in general the show had a British flavor, the decoration of the individual stands being left to the tastes of those who occupied them according to English practice, evidence of the American plan of preserving uniformity throughout the various booths was exhibited in the color scheme, which was limited to blue, gold and white, the colors of the Automobile Club. The usual complement of lattis work booths and myriad incandescent lamps added to the effectiveness of the show.

The American exhibits were confined to low and medium priced cars, and in each case save one—the Studebaker Corporation, which staged its own exhibit—the displays were made by Australian agents. Two dozen accessory dealers were on hand with a full line of products.

The American cars shown were: Stearns-Knight, Stoddard-Dayton, Warren, Lambert, Kelsey, Maxwell, Buick, Studebaker, Hupmobile, Chalmers, Overland, Ford, Marathon, Abbott-Detroit, Krit, Pullman, Cadillac, and Metz. The foreign cars on view were: Mors, Loreley, Sperber, Briton, Turner, Salmon, Mathis, Metallurgique, Belsize, Russell, Arrol Johnston, Lorraine-Dietrich, Nazzaro, Opel, Hispano-Suiza, Hotchkiss, Daimler, Austin, Delaunay-Belleville, Napier, Albion, Renault, Rolls-Royce, Minerva, Talbot, Wolseley, Vinot, Adler, Lanchester, Siddeley-Deasy, Gregoire, Le Gui, Fafnir, Dennis, Lancia, A. C., Clement-Bayard, S. C. A. T., Imperia, Vulcan, Sunshine, Argyll, Standard, Sunbeam, F. N., B. S. A., Mercedes, Berliet, Armstrong-Whitworth, La Buire, Singer, Martini, Adams, Thames, Excelsior, Delahaye, Brenna, Straker-Squire, Swift, Calthorpe, Darracq, Rapid, Roland, Bianchi, Hortu, Enfield.

The commercial vehicles exhibited were: Sampson, Lorraine-Deitrich, Lacre, Auto-Carrier, Karrier, Clement-Bayard, Commer, Thornycroft, Berliet, Hallford.

Dates Selected for Importers' Show.

January 2nd to 11th have been selected as the dates for the Importers' Salon which, as usual, will be held in the grand ballroom of the Hotel Astor, New York City. Of necessity, the show will not be a large one but, as heretofore, it will comprise the productions of at least five nations—England, France, Germany, Italy and Belgium.

Another American Car Enters Japan.

C. A. Pereira, of Yokahama, Japan, has secured the selling rights of the Halladay car for all of the Japanese empire and considerable contiguous territory. Pereira closed the contract with the Halladay people during a recent visit to this country.

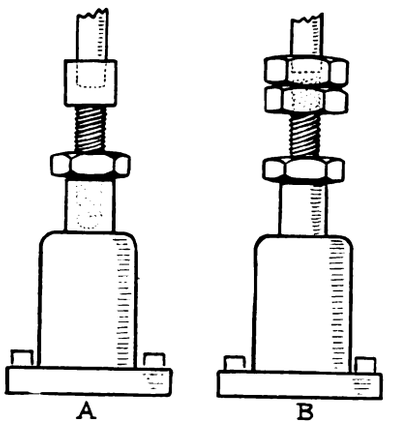
INGENUITY THE REPAIRMAN'S STOCK IN TRADE

Quick Thinking and a Varied Collection at the Bottom of the Tool Kit Work Wonders—Roadside Repair of a Broken Valve Lifter an Excellent Illustration of What can be Accomplished by a Handy Man.

Some repair shops are so situated that they get a large number of calls for help from more or less distant points, while others rarely hear from travelers in trouble; there are few, however, that are unfamiliar with telephone conversations that end with some such assurance as "All right; I'll send you a man. How soon? Oh, right away—just as quick as he can get his tools together." Which is a sure sign that someone is stranded on the road and can't get going again without assistance.

When Telephone Reports "Dead" Car.

The repairman who goes out on such a road job sometimes knows what sort of work lies ahead of him and can to some extent figure out his work as he goes to the scene of action; at other times he has not the slightest idea what he will have to do because the man who telephoned could give no more definite information than that the car was "dead."



A little ingenuity on the part of the repairman and an appreciation of the utility of various odds and ends that form a heteroneneous jumble in the bottom of his tool bag are valuable assets in helping cars out of roadside troubles. There are dozens of things that can be used for purposes for which they never were intended.

Motor That Jerked and Died.

A concrete example will serve to elucidate the principle. The owner of a well-known and popular car, a man who enjoyed driving his own machine but had a decided aversion to doing any more adjusting and "fixing things" than absolutely was necessary, telephoned to his garage, which included a well equipped repair shop, and complained that he was several miles out in the country with two cylinders on strike. In reply to questions, he said that one cylinder commenced missing early in the day and gradually went out of business. Running home on three cylinders was not such a terrible prospect; but when another cylinder suddenly "died" and the motor started jerking along on only two, the agony became too great to be borne with equanimity, either by the man or the motor. Hence the call. He was pretty sure the first cylinder to go wrong was suffering from ignition trouble; but the plug was apparently all right and the owner's engineering ability did not permit him to go deeper. The other cylinder, however, had something the matter with one of the valves, which would not open. The owner didn't know just what the trouble was, and anyway it was pretty dark and he didn't want to mess around.

Trouble Readily Is Located.

Out went the repairman into the night. Arrived at the scene of the trouble, the

BROKEN VALVE LIFTER REPAIR

causes for the failure of the two cylinders to function soon were discovered. In one the high-tension lead had chafed against the sharp edge of a flange nut until the insulation had become just thin enough to permit the spark to short-circuit. A few turns of tape and the tying up of the wire to avoid further chafing put that cylinder in working shape again. The other cylinder, in which there was "something wrong with a valve," was not quite so easily put right, but the job was quite a simple one for the experienced trouble man.

Valve Lifters Were Jarred Loose.

The inlet valves were in the cylinder heads, operated by rocker arms, the lower ends of which rested in sockets in the valve lifter adjusters. The arrangement of the adjuster is shown at A in the accompanying illustration. The adjuster consisted of a screw, with a long hexagon head, threaded into the lifter; a recess in the hexagon head received the lower end of the push-rod and a lock-nut held the adjuster in place in the lifter. By loosening the lock-nut and screwing the adjuster up or down the adjustment could be changed. Probably through some hidden defect in the hardened steel, the recessed head had broken off, letting the push-rod drop and, of course, rendering the valve inoperative.

Tool Kit Scrap to the Rescue.

The stub of the adjuster remained in place, and the trouble man made use of it in his quick and simple repair, which is shown, completed, at B in the illustration. Rummaging round in his tool-bag, two nuts were found that would fit the thread of the adjuster screw. These were put on the screw; the upper one was screwed down only a few threds, leaving the top of the nut higher than the top of the broken screw and so forming a recess for the foot of the push-rod. The second nut was brought up and screwed hard against the top one, acting as a lock and holding it securely in place. The difference in the length of the adjuster, due to the breakage, was compensated for by bringing the screw up in its thread and locking it in its new position with the original lock-nut.

Suppositions Easily Answered.

Twenty minutes was the time for the whole job, including the temporary repair of the worn high-tension lead, and when the motor was started it ran as though there was no way to run except the right way. The adjuster had broken off straight across, and the foot of the push-rod had a pretty good seat. There did not happen to be an adjuster in stock in the shop, so the car ran for several days before a permanent replacement was made, and was none the worse for it, beyond a little roughening of the lower end of the push-rod, which was quickly remedied by grinding.

"But what would you have done," inquired the owner, "if the screw had broken off down near the lock-nut?"

"Ask me something harder. Put in another screw, that's all, and fix it up the same way."

"What if the screw broke off so short you couldn't get it out?"

"Well," retorted the trouble-man, practically, "she ran twenty miles on three cylinders. Guess she ought to be good for three more."

In the RETAIL WORLD

H. L. Garton has opened a garage in Centerville, Ia.

Fred C. Schmidt is about to build a garage in Holland, Ia.

Edward Hayford & Sons are erecting a garage in Newton, N. H.

W. L. Kloppenburg is about to build a garage, 44 x 60 feet, in Everly, Ia.

Pieper & Krause of Norwood, Minn., are about to erect a garage, 36 x 40 feet.

A. C. Pollard of Nashua, N. H., has let contracts for a garage, 65 x 52 feet.

Herman Lundby of Ostrander, Minn., plans to establish a garage in that town.

S. P. Cleek, of Sebastopol, Cal., is having plans prepared for a garage, 50 x 100 feet.

The Boone (Ia) Auto Co. has awarded the contract for a new garage, 75 x 100 feet.

Frederick W. Davis of Fall River, Mass., plans to build a garage at 279 North Main street.

Paul Scott of Moundridge, Kan., has sold his interest in the Auto Garage to C. C. Kaegi.

Barney Gilinsky is building a garage in Council Bluffs, Ia. The cost will approximate $8,000.

John Page, formerly of Anderson, Ind., is about to establish a garage in Marion, in the same state.

The Superior Motor Car Co. has opened a new garage in Middletown, Ohio. Eugene Urtz is in charge.

G. C. Reames has purchased the Jackson Garage in Ellendale, Minn. He also will handle the Overland line.

Charles M. Wells of Scranton, Pa., has been granted authority to build a garage, 22 x 36 feet; it will cost $2,600.

The Montana Auto and Garage Co. of Butte, Mont., is building a new garage at Broadway and Arizona streets.

H. D. Easton of Oneonta, N. Y., is to reconstruct a barn for use as a garage and repair shop; it will be 30 x 100 feet.

Owen Letter's Sons are about to build a garage, 50 x 90 feet, at Trenton avenue and Westmoreland street, Philadelphia, Pa.

The Empire Garage, in Portchester, N. Y., which was recently destroyed by fire, is being reconstructed; the repairs will cost $7,000.

Rekenthaler & Heilman, garage operators in Cushing, Ia., have dissolved partnership; Rekenthaler will continue the business.

Construction is now under way on the Pavilion Garage, a new enterprise in Montpelier, Vt. It is located on Court street.

Charles C. Chase has had plans drawn for a garage which he will build in Bradford, Mass.; the estimated cost is $25,000.

Frank Leflem of Philadelphia, Pa., is securing estimates on a garage, 56 x 176 feet, to be built at Broad and Rockland streets.

Boyd & Michaels of Cedar Rapids, Ia., have sold their garage business; they will open another in Waterloo, in the same state.

The Bering Tire & Rubber Co. of Houston, Tex., has opened a branch store at 1114 Preston avenue; the main store is on Main street.

Canutesson & Godagen of Clifton, Tex., are making ready to build a garage, 30 x 80 feet; at present they operate a blacksmith shop.

John Scully is having plans prepared for a garage to be erected in Newark, N. J., at 235 Central avenue; the plans call for an expenditure of $5,000.

Oscar Harris and Martin White have laid the foundations for a garage at 725-727 Madison avenue, Paterson, N. J. The cost is estimated at $2,500.

E. H. Mahoney and Paul Clement of Cedar Falls, Ia., are about to open a garage in La Porte City, in the same state; it will accommodate 20 cars.

M. Bennett, manager of the Ridgeville (O.) Garage, is planning the establishment of a garage in Elyria, O. The location is on East Broad street.

John Torrent is building a garage in Muskegon, Mich. It will cost $10,000 and when completed will be occupied by O. C. Schultz of the Ford Motor Co.

Stillman & Devalon, proprietors of the City Garage in Portersville, Cal., have become automobile dealers; they have taken on the Detroiter agency.

Ralph C. Hamlin, the Franklin dealer in Los Angeles, Cal., has let the contract for a garage to be erected at 1040 South Flower street; it will cost $16,000.

The Missouri Taxicab Co., of St. Louis, is to build a $25,000 garage on Euclid avenue, south of Washington boulevard; the front section of the building, which will be leased for other business, will be 50 x 60 feet and two stories.

L. H. Roosa of Dimondale, Mich., has purchased the interest of Clifford Rhodus in the garage firm of Losee & Rhodus, in Charlotte, in the same state; the new style will be Losee & Roosa. The business includes the selling of Ford and Rambler cars.

The Barlow Garage Co., recently organized in Newark, N. J., has leased quarters in a building now being constructed at 133-35 High street. The new building will have facilities for charging 60 electric cars a day and will contain a 6-ton electric elevator.

C. W. Halderman and William Milroy have leased the Coliseum, at Adams and 6th streets, Marion, Ind., for five years and will make of it a garage and salesrooms; Small Bros., Buick dealers, will be associated with the two men in the remodeled building.

The North Star Auto Co., of 913 North Kansas avenue, Topeka, Kan., has been sold by W. T. Williams to P. Rutty, who formerly was interested in the North Topeka Cycle & Supply Co. The automobile company's style has been changed to North Topeka Auto Co.

New salesrooms are being built in Toledo, O., for L. E. Barger, Charles T. Lauer and Eli W. K'Burg, automobile dealers, at Madison avenue and 15th street; Barger is dealer in Abbott-Detroit and Pope-Hartfords, Lauer in American and Marion cars, and K'Burg in the Hupp-Yeats. The building will be one-story, 100 x 160 feet.

Affairs of the Flanders Manufacturing Co. of Pontiac, Mich., in New York City, heretofore conducted on the branch plan with William R. Chandler as manager, were taken over Tuesday of this week, 1st inst., by the Holt-Chandler Co., as an agency; associated with Chandler in the new company is H. Emil Holt, for a number of years metropolitan dealer in Pope cars. The salesrooms of the agency will be at 1808 Broadway, with a service station at 146 West 63d street; the former Flanders quarters at 1932 Broadway will be given up.

ATHLETES AGAIN TRIUMPH DESPITE NEW SCORING PLAN

"Extra Credits" Fail to Help Chicago Automobile Club's Team—Fifteen Finish 170-Mile Contest With Clean Scores.

Although rules were altered so that those contenders who were sufficiently fortunate to finish the 171-mile run "in good order," so to speak, received credit points to balance against the demerits of their less fortunate team mates, the results of the sixth interclub reliability contest of the Chicago Automobile Club and the Chicago Athletic Association, which was contested on Saturday last, 12th inst., was the same as the results of all save one of the previous contests—a victory for the "athletes." The final reckoning gave the C. A. A. team 32 points on the credit side of the book and the team of the C. A. C. 233 points on the debit side.

Under the new rules, each of the contestants—there were ten on each team—received five credit points provided he finished without incurring penalty. Demerits were meted out under Grade 3 rules of the A. A. A., and the algebraic sum of the points of merit or demerit charged to the individual contestants gave the team scores. Only W. C. Thorne, on the "athletic" team, who drove an American car, was penalized. He had 13 points marked against him for work on his motor. On the Automobile Club team, A. M. Robbins was penalized the most heavily of the four contenders who helped to pile up the demerits. He received 250 black marks for time consumed in adjusting shock absorbers and lateness at the noon control at Brook, Ind. H. P. Branstetter (Kissel) and F. A. Yard (Inter-State), who received 3 points each for stalling their motors, and W. R. Roberts (Cadillac), who received 7 points for road work on his motor, were the others who helped to swell the wrong score of the Automobile Club team.

Both the Ray trophy, which is awarded for the team with the least penalization, and the White trophy, which goes to the team with the greater number of perfect scores, were captured by the victorious team, as well as a banquet served at the South Shore Country Club at the conclusion of the run at the expense of the losers.

The final scores were:

Chicago Athletic Association.

Grennon Stars at New England Meet.

Things went Joe Grennon's way at the race meet on the Imperial Park track, Springfield, Mass., promoted by E. W. Powell, on Saturday last, 12th inst. Driving a Mercer car, he won three of the seven events on the program, including what proved to be the most interesting contest of the day, the five-mile free-for-all handicap, which he finished in 7:34⅗ from scratch. His other victories comprised a half-mile free-for-all and a three-mile Class E event, which he accounted for in 49⅕ seconds and 4:28, respectively, in each case driving against two contenders, H. Hickman (Mercedes) and J. Berriman (Stoddard). Harry Kyle (Pope) took two of the remaining events, and Louis Menenghetti (Fiat) and Henri Hickman (Mercedes) accounted for the remainder. The summary:

Three miles, free-for-all—Won by Henri Hickman (Mercedes); second, Joe Grennon (Mercer). Time, 4:49⅘.

Five miles, for cars with displacements of under 601 inches—Won by Harry Kyle (Pope); second, George Cook (Zust). Time, 7:39.

One mile, time trial—Louis Menenghetti (Fiat). Time, 1:28.

One-half mile, free-for-all—Won by Joe Grennon (Mercer); second, Henri Hickman (Mercedes); third, J. Berriman (Stoddard-Dayton). Time, 0:49⅘.

Three miles, for cars with displacements of under 601 inches—Won by Joe Grennon (Mercer); second, J. Berriman (Stoddard-Dayton). Time, 4:28.

Ten miles, match race—Won by Harry Kyle (Pope); second, Henri Hickman (Mercedes); third, George Cook (Zust). Time, 15:06.

Five miles, free-for-all, handicap—Won by Joe Grennon (Mercer), scratch; second, Harry Kyle (Pope), 10 seconds; third, Henri Hickman (Mercedes), 30 seconds. Time, 7:34⅗.

TROPHY GIVER STARTS HIS OWN GLIDDEN TOUR ALONE

Several Cars Accompany Him from Detroit to Indianapolis But There Stop—Stimulating Interest Avowed Object.

Accompanied by an escort of eight cars, among which were the Flanders electric coupe which blazed the trail, and one of the three Maxwell cars which finished the National Reliability Tour of 1911 with clean slates, Charles J. Glidden left Detroit Monday morning last, October 14th, to cover the 1,600 mile course which had been laid out for the abandoned A. A. A. National tour of this year. Mr. Glidden's professed purpose in piloting his Maxwell between the Automobile Capital and the Crescent City, over roads which are none too good, to put it mildly, is to stimulate interest in the run which will be made next year, and with this in view invitation has been extended to motorists along the line to accompany the trophy donor for distances as long or as short as they will. As for the eight cars which accompanied Glidden out of Detroit, they proceeded only as far as Indianapolis, which was reached on Tuesday evening last, October 15th.

Before the first night stop—Ft Wayne, Ind., 170 miles from Detroit—had been reached, one of the eight consorts, a Maxwell car driven by Dr. F. E. McClure of Cleveland, was overturned in a ditch. The accident was caused by the blowing out of a rear tire when the car was traveling at a high rate of speed, and fortunately none of the occupants was seriously injured. Fine roads were encountered for the entire distance which separates Indianapolis from the Automobile City, which accounts for the 30-mile-an-hour average running time which was maintained.

In the car with Glidden are M. R. Newton, advertising manager of the United States Motor Co.; Charles Walls, who drove one of the winning Maxwell entries in the tour of last year, and a photographer, all of whom will complete the tour. If things go as well as the tourists expect, New Orleans will be reached Saturday evening next, 19th inst.

Dust Accounts for Race Postponement.

Because of the condition of the track, which was soft and dusty, the races which were to have been run at Rockingham Park, Salem, N. H., Saturday last, 12th inst., did not materialize. According to present indications, the races will be staged on Saturday next, 19th inst., by the Salem Automobile Club.

EVEN HONORS IN ILLINOIS FOR DISBROW AND NIKRENT

Former Lowers Track Record and Latter Wins Ten-Mile Event at Springfield—Ulbrecht and Endicott Get One Each.

Although both Louis Disbrow, who piloted a Simplex car throughout the day, and Joe Nikrent, who drove a Case, each won two of the competitive events on the program offered Saturday last, 12th inst., at Springfield, Ill., by the Illinois State Fair Association, by virtue of a single time trial which he completed in 0:51⅕, lowering the local track record for the distance by two seconds, the Simplex pilot became the "matinee idol." On the other hand, Nikrent was roundly acclaimed when he crossed the tape a winner in the feature event of the day, a ten mile free-for-all, which he completed in 10:28⅕. He also won a five-mile Class C event. Disbrow won a three- and a five-mile event, his times being 2:56⅘ and 4:35⅘ for the respective contests. The two numbers which remained on the seven-event program, a five-mile Class C event for cars with displacements of 231-300 inches, and a five-mile free-for-all handicap, went to William Endicott (Schacht) and H. Ulbrecht (Case). The summary:

Five miles, for cars with displacements of 161-230 inches—Won by Joe Nikrent (Case); second, Luttrell (Stutz). Time, 5:35.

Five miles, for cars with displacements of 231-300 inches—Won by William Endicott (Schacht); second, Madden (Inter-State); third, Luttrell (Stutz); fourth, Mconald (National). Time, 5:10.

One mile, time trial—Louis Disbrow (Simplex). Time, 0:51⅕.

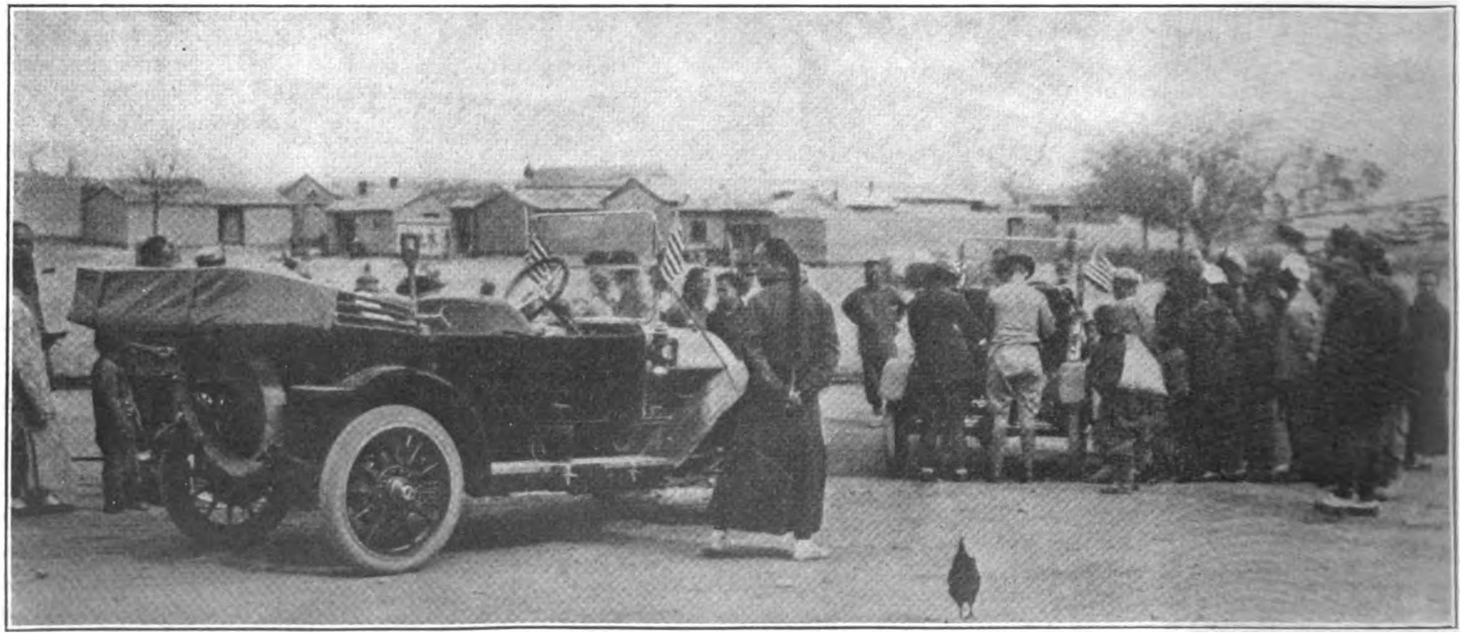
Five miles, free-for-all handicap—Won by H. Ulbrecht (Case); second, Parker (Fal). Time, 5:30⅗.

Three miles, for cars with displacements of under 601 inches—Won by Louis Disbrow (Simplex); second, William Endicott (Schacht); third, Kilpatrick (Hotchkiss). Time, 2:56⅘.

Five miles, for cars with displacements of 301-450 inches—Won by Louis Disbrow (Simplex), second, H. Ulbrecht (Case); third, William Endicott (Schacht). Time, 4:35⅘.

Ten miles, free-for-all—Won by Joe Nikrent (Case); second, Luttrell (Stutz); third, Parker (Fal); fourth, McDonald (National). Time, 10:28⅕.

Indianans Talk Cross-Continent Tour.



If a suggestion which was made at the last meeting of the Indiana Automobile Manufacturers' Association in Indianapolis bears fruit, the next tour promoted by that body will be a very much more pretentious affair than the Four States expeditions which hitherto it has undertaken. It is proposed to kill two birds with the same tour, so to speak, by selecting a route from Indianapolis across the continent to San Francisco and thereby not only extensively advertising the Indiana products in which the tourists will ride, but blazing a trail for the Fisher-Allison coast to coast stone highway, if that project becomes a reality. The matter is at present in the hands of the tours committee, though in view of the fact that those in attendance at the meeting were unanimously in favor of it, it is not altogether unlikely that it will come to pass.

SEEKING TO REDUCE THE SMALL BOY STREET PERIL

"Conservers of Human Life" Undertake to Teach Children to Avoid Traffic Dangers—Blackboard Lectures a Feature.

Of all the perils that beset motorists, particularly in large cities, none equals the small boy and none is so numerous. How to subdue his habit of playing in the public street long has been constituted a problem, the solution of which is difficult, if not impossible. In an effort to save the youngsters from themselves, however, the American Museum of Safety, which exists to "conserve human life" and which at present is located at 29 West 39th street, New York City, has undertaken a course of lectures with a view not only of keeping the young ones off the streets but of teaching them how to avoid accidents in crossing streets.

The first lectures were given in the rooms of the museum by Mrs. Dr. Tolman, wife of the director of the institution, but permission of the educational authorities having been obtained, a dozen New York schools were visited during the last month. The lectures are free and are open alike to adults and children. They are illustrated by diagrams, chalk drawings and lantern slides and have been attended by upwards of 4,000 children. During the summer the schools of New Jersey were covered, and it is believed that as a result of the lectures the proportion of accidents to pedestrians decreased 40 per cent. during the last three months.

CELESTIAL CURIOSITY—ARRIVAL OF OVERLAND CARS IN TIENTSIN, CHINA

Digitized by Google

1,017,236. Vehicle Wheel. Ivar L. Tvinde, Watertown, S. D. Filed Mar. 9, 1911. Serial No. 613,419.

In a vehicle wheel, the combination with a rim and a hub, of flat spring steel spokes, arranged around the hub, each spoke having a U-shaped bend intermediate its ends and curved end portions that run to the rim and hub respectively, the outer end of each spoke having a hook formation arranged for pivotal connection with the rim, clips secured to the rim, one for each spoke, each clip having a round shank between which and the rim the hook of the spoke is confined in pivotal condition, and clips for securing the inner ends of the spokes upon the hub.

1,017,300. Single Spark Ignition System. Edwin S. Lincoln, Brookline, Mass., assignor to Electric Goods Manufacturing Company, a Corporation of Maine. Filed Dec. 6, 1909. Serial No. 531,645.

1. In an electric discharge producing system, in combination; a source of electric energy; an induction coil; an energizing circuit adapted to connect the source of energy with the coil; a circuit interrupter having separable contacts intercalated in said energizing circuit, said interrupter including an actuating winding for causing the separation of said contacts; an actuating circuit adapted to connect the source of energy with the actuating winding; and means for contemporaneously closing said energizing and actuating circuits independently.

1,017,330. Spring Wheel. Frank Smith, Rossville, Ga. Filed Apr. 11, 1911. Serial No. 620,349.

1. A wheel comprising a hub, spaced inner and outer rims, the inner rim being carried by the hub, and the outer rim having annular flanges on its inner periphery, cushioning elements interposed between the rims, and an annular band encircling and secured to the outer periphery of the inner rim, said band having a channel on one side of the inner rim, annular plates encircling the band and closing up the space between the rims, the aforesaid flanges having a sliding engagement with the plates, a loose connection between the plates and the flanges, a split ring seating in the foresaid channel and engageable with one of the plates, means for contracting said ring in the channel, integral lugs on the band, said lugs being located between the plates, and fastening means passing through the lugs and the plates.

1,017,335. Lock for Steering Wheels. Theodore D. Stanley, Detroit, Mich. Filed June 5, 1911. Serial No. 631,447.

1. In a steering mechanism for vehicles, a steering post, a sleeve adapted to reciprocate on the post, a steering wheel adapted to rotate on the post, a clutch, the co-acting parts of which are respectively carried by the sleeve and steering wheel, means for forcing the clutch member carried by said reciprocating sleeve into co-acting relation with the clutch member carried by the wheel, and means adapted to secure the reciprocating portion of the clutch in a locked and an unlocked relation to said steering wheel clutch portion.

1,017,363. Wheel. James J. Adamsen, Brooklyn, N. Y. Filed May 15, 1911. Serial No. 627,182.

1. A wheel having a rim, an outer tread shoe, a device including a plurality of links arranged in a continuous zig-zag course around the entire rim, bearing pieces having elongated slots, pivot pins at the vortex of each angle formed by the links engaging in said slots, and radially adjustable plugs upon which rest the bearing pieces on the inner side of said device, whereby the pressure at any point upon the shoe may be distributed to all parts of the shoe around the entire rim.

1,017,396. Radiator. John M. Fedders, Buffalo, N. Y., assignor to Theodore C. Fedders, Buffalo, N. Y. Filed Dec. 8, 1911. Serial No. 664,603.

1. A radiator comprising inlet and outlet headers, and a core arranged between said headers and consisting of a plurality of units, each unit comprising two sections, one of which is constructed of a strip of sheet metal to form a plurality of flat webs and a plurality of transverse locking beads arranged at intervals on said strip and the other section being constructed of a strip of sheet metal to form a plurality of transverse plaits, each of which engages at its crown with the concave side of one of the beads in the other section and a plurality of curved webs each of which connects the opposing plies of two adjacent plaits and is arranged with its convex side opposite a flat web of the other section.

1,017,435. Shock Absorber. Henry Luxembourger, Jr., Los Angeles, Cal. Filed Apr. 18, 1910. Serial No. 556,029.

1. In combination, a vehicle having a body, an axle, a carriage spring supporting said body on said axle, a resilient cross-head attached to said axle, stems co-operating with said cross-head, springs disposed around said stems seating against said cross-head, and means for guiding said stems on said body.

1,017,453. Gas Engine Starter. John J. O'Leary, Healdsburg, Cal. Filed Feb. 25, 1911. Serial No. 610,839.

1. The combination of a driven shaft, a clutch hub keyed upon said shaft, a flanged disk adapted to drive said hub in one direction, friction rollers interposed between the periphery of said hub and the inner surface of the flange of the disk, a casing removably attached to the flanged side of the disk, a housing secured to the other side of said disk, a spring inclosed in said housing, a pin supported adjacent the periphery of the housing and to which one end of said spring is connected, a collar having radial teeth upon one of its faces slidably mounted upon said shaft and projecting inwardly into the aforesaid housing and having attached the other end of the spring, a complementary clutch member secured upon the shaft, having teeth adapted to engage with the teeth of said collar, a lever adapted to engage and restrain the collar, and a spring bearing against one side of the flanged disk and normally effective to thrust the toothed collar into engagement with the clutch member, and means for restraining the housing during the winding of the main spring.

1,017,456. Tire. William Pavlik, Bayport, N. Y. Filed Sept. 22, 1911. Serial No. 650,718.

A tire comprising a concave rim, an annular yieldable block mounted upon said rim, a convexo-concave tire mounted upon said block, socket members carried by the inner side of said tire and abutting against said block, bolts extending through said rim and said block into said socket members, said block snugly engaging said bolts heads carried by said bolts and movably arranged in said socket members, nuts screwed upon the inner ends of said bolts for retaining said bolts in engagement with said rim, and coiled compression spring embedded in said bylock and encircling said bolts between said socket members and said rim.

1,017,459. Electric Spark Plug for Combustion Engines. Leopold Podszus, Charlottenburg, Germany. Filed Nov. 23, 1910. Serial No. 593,951.

1. In a spark plug, an electrode having an opening therein, non-radial holes in communication with said opening, and means for admitting air through said opening and said holes for causing a rotary circulation of air around the electrode.

1,017,466. Vehicle Wheel Rim. George T. Reichenbach and Hartwig O. Peck, Portland, Ore., assignors to H. O. Peck Automobile Wheel Company, Incorporated, Portland, Ore. Filed May 9, 1911. Serial No. 626,018.

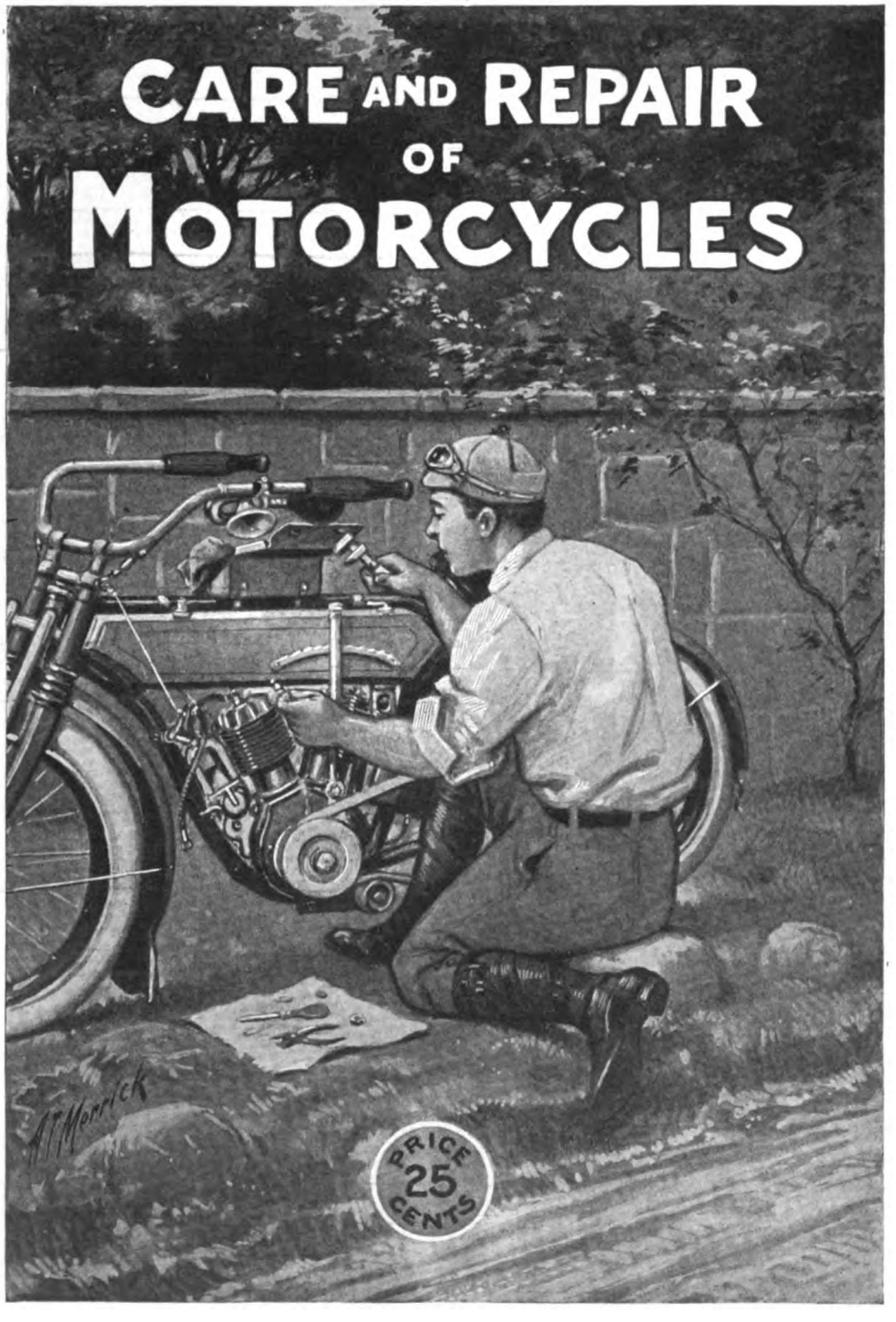
1. In a vehicle wheel, a rim composed of a pair of side plates having tire receiving channels at their outer peripheries, spoke heads pivoted between said plates and spaced apart, an inner annular band for closing the space between said side plates adjacent to the inner edges thereof, said band having portions bent to form spoke head receiving pockets and means for securing said side plates and said band in position.

1,017,474. High Tension Magneto Electric Apparatus. Frederick Richard Simms, Kilburn, London, England, assignor to The Simms Magneto Company, a Corporation of New York. Filed June 27, 1910. Serial No. 569,200.

1. In a high tension magneto, the combination with the high tension terminal thereof, of a conductor connected with the high tension terminal, a detachable ring surrounding a portion of the conductor, out of contact therewith and separated from the conductor only by an air gap, to form a spark gap between the inner face of the ring, and the portion of the conductor passing therethrough, said ring having a ground connection, and means for detachably supporting said ring, whereby the ring may be removed and a ring of different internal diameter substituted therefor, to adjust the spark gap.

1,017,485. Broken Spring Repairer. John H. Warner, Mount Pocono, Pa. Filed June 29, 1911. Serial No. 635,939.

1. The herein described emergency repairer for vehicle springs consisting of a flat spring of less length than the one to be repaired and having eyes in its extremities, a rod passing transversely through each of said eyes and having itself an eye in one end and a hook in the other, a section of chain having one end link engaging said eye in the rod and of a length sufficient to permit it to pass around the broken spring and engage the hook, and means for temporarily holding the emergency spring upon the center of the other spring.



1,017,512. Vehicle Spring. George Conderman, Hornell, N. Y. Filed Jan. 15, 1909. Serial No. 472,408.

1. A vehicle frame comprising strip metal in rectangular form for a supporting platform, strip metal in the form of an arch attached to said platform at each side, leaf springs on said arch, and a vehicle body supported by said leaf spr' igs.

Spend a quarter for this book—save many dollars in repair bills

It is the motorcyclist's best friend because it is always on the job to help in time of trouble and you don't need a mechanical engineer to understand it.

It is brimful of practical advice and suggestions relating to every type of motorcycle.

The present edition includes free engine clutches, two-speed gears, mechanical lubricators and magnetos, together with special matter on motors, valves, carbureters, fuel and important general subjects, all plentifully illustrated.

Dealers and jobbers in all parts of the country are selling "Care and Repair of Motorcycles" to both new riders and veterans as the best aid in correcting and avoiding motorcycle trouble.

Ask your dealer about it, or send a quarter to us for a copy to be sent you postage prepaid.

Special rates to Jobbers and Dealers in quantity orders.

The Willard Storage Battery Company,
CLEVELAND, OHIO.

Attention - Mr. Willard.

Gentlemen:

The batteries which you furnished us for use on the Flanders Electric on its Glidden Tour Path-finding trip, we are returning to you after having made a slight examination of their condition before shipping.

The conditions which we encountered were at times extremely severe. The load on the battery very frequently ranged from one hundred to three hundred amperes continuously. This was followed by an immediate charge, generally starting at about ninety amperes and finishing at thirty. I do not see how any battery could have stood what was imposed upon this, without showing very decidedly the effects of its treatment.

Outside of the breaking of one connector, absolutely no trouble was experienced with the battery at any time. It was frequently found that, after standing all night, the temperature of the battery was 110 degrees Fahrenheit; attempting to charge the battery at this temperature naturally boosting to the neighborhood of 120 to 125; repeated charging under these conditions would naturally cause more or less deposit from the plates.

We note that in battery which was driven about fifteen hundred miles this deposit is hardly noticeable, showing the remarkable wearing qualities of the battery which you are making. It is undoubtedly the hardest test to which an electric car was ever subjected, and the success which we had on the trip was very largely due to the most excellent performance of your product.

We wish to say at this time that your battery is not surpassed or equalled by any commercial battery that we know of. Wishing you continued success, we beg to remain,

Yours very truly,
FLANDERS MANUFACTURING COMPANY.

What to Do with

If You Have Any Good Ideas Cash in on Them by Putting

The Cash Prize Used Car Contest is in no sense a literary contest and no article will be judged by the amount of correct English or pure rhetoric with which it is constructed.

The articles may be long or short and "literary style" will not figure in the award. Practical ideas, and preferably plans which have been put into practice and proved true, are what are desired. The policy pursued by the small dealer is likely to prove quite as valuable as that brought to bear by the large one.

How Do You Overcome the Used Car Evil?

How do you keep it from standing between you and the profit you ought to earn through the sale of a new car? That's what we want to know, so

Just Give Us the Facts. We Will Write the Article

if you say so, and put it in shape for publication. Of course, we will print your letter just as you write it unless otherwise ordered, but we are willing to help you put it in good shape if you think we ought to do it.

We want to co-operate with dealers by giving full publicity to the ways and means adopted by them in overcoming the profit-killing influence of the car that is being sold and re-sold to the detriment of new car sales.

The Stutz, the Only American Car to Finish the Grand Prix, Was Equipped with

70% MORE TIRE MILES

McCUE WIRE WHEELS

IDEAL MOTOR CAR Co. STUTZ INDIANAPOLIS, IND.

THE CAR THAT MADE GOOD IN A DAY

THE FAMOUS STUTZ MOTOR CARS MANUFACTURED BY THE IDEAL MOTOR CAR CO.

430-438 N. CAPITOL AVE. Indianapolis, Ind.

October
Ninth
1912

McCue Company,
Buffalo, N. Y.

Gentlemen:

We wish to inform you that your wire wheels stood up nobly well in both the Vanderbilt and Grand Prize races, on the Stutz car.

We found it necessary to only change one rear tire in the Vanderbilt race and one rear tire in the Grand Prize race, the front tires going through both races, the Vanderbilt and Grand Prize, without a change and the two rear tires that we changed in both races were simply on account of worn tread and not due to loss of air. Upon examining the spokes of these wheels, after going through both races, we did not find one loose spoke or a wheel the least out of true.

This performance has not only converted the writer to wire wheels but has caused him to give an option of wire wheels on future Stutz cars.

None of the wheel locks loosened a particle, in either race, and were just as secure at the finish as they were in the start.

We wish to congratulate you on your wheels from a practical standpoint and wish you every success you deserve.

With best personal regards, beg to remain,

Very truly yours,

IDEAL MOTOR CAR COMPANY.

H. C. Stutz

President & General Manager.

HCS/RG

In over 700 miles of racing, this same wire wheel equipped car changed only two tires—neither of which needed to be changed.

A simple perusal of the letter reproduced herewith is the best selling story of wire wheels we know. Just read it over—it's simply immense. In both the Vanderbilt Race of over 300 miles and the Grand Prix Race of over 400 miles, the Stutz car changed only the two rear tires, one in each race, and then changed them only because the tread was worn and not because they had blown out.

No need to emphasize the fact that no possible strain could be greater than that of driving, as did Gil Anderson, in both these events and yet upon examination these wheels were found to be perfect in every respect.

Remember that the performance of wire wheels on racing cars is merely an indication of their wonderful merit on cars in ordinary use. Dont' fail to insist on having wire wheels upon the cars you intend to sell. It's dollars and cents in your pocket—because you will sell more cars when wire wheels are in general use and because the cars you sell will give better satisfaction.

Let us ask you again to be sure and read this letter we show herewith. Then write for our booklet, "Mileage Plus," which tells you all about wire wheels.

The McCue Co.

No matter what cars you *now* handle—get the Franklin Dealer Proposition. Franklin dealers make money—and have a permanent, steadily increasing business.

Franklin is now the third largest selling high priced car, and gaining rapidly on second. Satisfied owners and successful dealers are a winning combination.

Franklin cars are easy to sell because (1) use less gasoline, averaging 20 per cent to 35 per cent more mileage per gallon; (2) use less oil, averaging 400 miles per gallon, without smoke; (3) use fewer tires, averaging 8000 to 10,000 miles per set, the 1911 record; (4) travel faster in the long run, owners thinking little of making 200, 300 or even 350 miles and more per day, without fatigue; (5) ride easier, bowling along so smoothly and comfortably, without jolt or jar, that driver and occupants do not realize that they are steadily traveling at such speed; (6) and wear longer than other cars, many Franklin cars giving satisfactory service to the same owner for five, six, eight and ten years.

We will send full particulars of the Franklin Dealer Proposition to any automobile dealer, garage owner or automobile owner financially capable and with the business experience to become a successful dealer, provided he will fill out this coupon and mail to us immediately.

The sending of this coupon does not obligate the sender or us. It is merely a convenient way to get all the facts.

FRANKLIN MODELS AND PRICES

Franklin cars are built in four models on five chassis sizes:

	List
D Touring, 6 cylinders, 38 H.P., 5 passengers	$3,500
D Torpedo-phaeton, 6 cylinders, 38 H.P., 4 passengers	3,500
G Touring, 4 cylinders, 25 H.P., 5 passengers	2,000
G Runabout, 4 cylinders, 18 H.P., 2 passengers	1,650
H Touring, 6 cylinders, 38 H.P., 7 passengers	3,750
H Limousine, 6 cylinders, 38 H.P., 5 passengers inside	$4,750
M Touring, 6 cylinders, 30 H.P., 5 passengers	2,800
M Torpedo-phaeton, 6 cylinders, 30 H.P., 4 passengers	2,800
M Roadster, 6 cylinders, 30 H.P., 2 passengers	2,800

SEE WHAT'S GOING ON INSIDE

DON'T GUESS AT TROUBLE

VISO "The Plug with the Open Window"

PAT. PEND.

If you, Mr. Dealer, would handle this plug only for the radical improvement we have made upon it in the installation of the "open window," then you have a big selling argument, but we do not want you to lose sight of the fact that this plug, without the "see at a glance" feature, would still be the most sturdy, dependable spark plug on the market at any price.

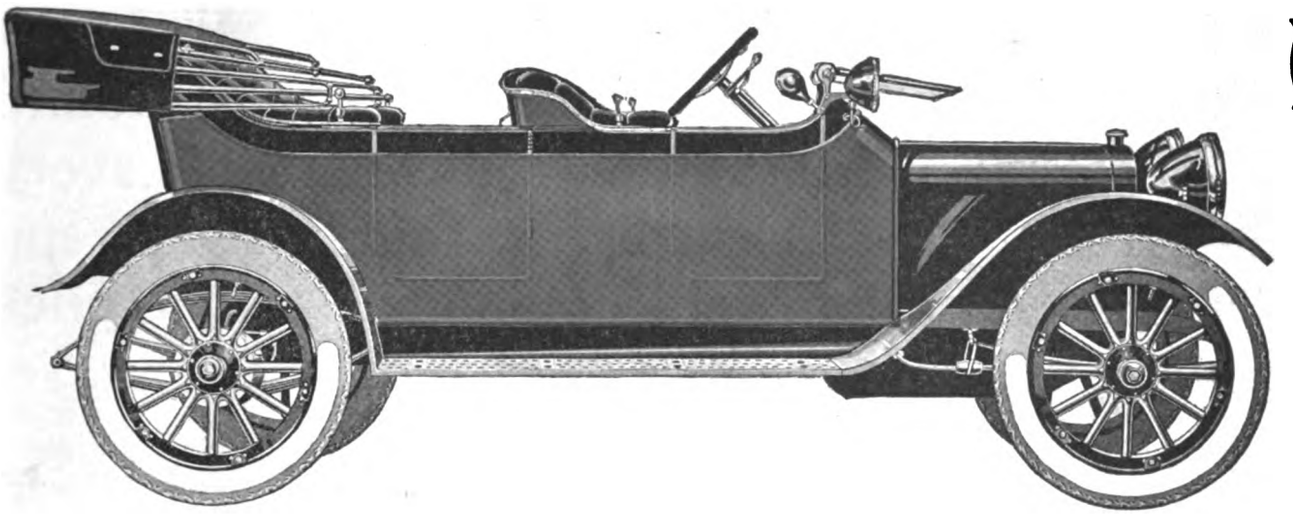
We are featuring, first of all, the quality of materials used—the construction that guarantees against breakage and injury from oil, dust and dampness. In fact, every good point that goes to make a good plug, all are embodied in the Viso.

The "open window" or "port," as shown in this illustration, is a time, trouble and money saver, for with your eye on the window and your hand on the carburetor adjustment, you can regulate ignition in an instant—**not by guess work, but by sight,** remembering always that imperfect combustion or carbon troubles will be indicated by a yellow light—perfect combustion by a pale blue electric spark—a dead cylinder by a dark window.

In the lower right hand corner of this advertisement, we have enumerated the good selling points of Viso plugs—read them, and then order a set for your own car. Use them to demonstrate to your trade and see how quickly and surely your spark plug business will increase.

Write for our literature describing this device in more detail—that is, if this advertisement does not completely satisfy you.

Remember the price, $1.00 on all three sizes, allows you a liberal commission. Get the story from us.



The Features of the VISO Plug:

1. Indicates in which direction your trouble lies.
2. It facilitates the timing of the engine.
3. It intensifies the spark in all cylinders.
4. Consumes only minimum current.
5. Adjustable gap permits regulating the spark for any cylinder.
6. The gap intensifies the spark and is absolutely non-injurious to battery, coil or magneto.
7. Causes instantaneous combustion.
8. Is a correct check on the current as delivered to the spark plug.
9. It cleans itself should it become fouled, by merely increasing the gap.
10. It is fully guaranteed and offered with the conviction that it is a great step forward in plug construction.

R-C-H "Twenty-Five" "The Car Complete" $900

F. O. B. DETROIT

THE CAR

The best materials, the highest-grade workmanship, and the most up-to-date ideas in construction.

Wheelbase—110 inches.

Motor—Long stroke; 4 cylinders cast en bloc; 3¼-inch bore. 5-inch stroke. Two-bearing crankshaft. Timing gears and valves enclosed. Three-point suspension.

Steering—Left Side. Irreversible worm gear, 16-inch steering wheel. Throttle control on steering column.

Control—Center Lever operated through H-plate integral with universal joint housing just below. Hand lever emergency brake at driver's right. Foot accelerator in connection with hand throttle.

Springs—Front, semi-elliptic; rear, full elliptic and mounted on swivel seats.

Frame—Pressed steel channel.

Axles—Front, I-beam, drop-forged; rear, semi-floating type.

Transmission—Three speeds forward and reverse; sliding gear, selective type.

Construction—Drop-forgings wherever practicable; chrome nickel steel used throughout all shafts and gears in the transmission and rear axle; high carbon manganese steel in all parts requiring special stiffness.

Body—Full 5-passenger English type; extra wide seats.

EQUIPMENT

The most complete, highest-grade equipment ever placed on a popular-priced car.

Non-skid tires—32 x 3½.
12-inch Hall Bullet electric head lights with double parabolic lens.
6-inch Hall Bullet electric side lights with parabolic lens.
Exide 100 Ampere Hour Battery.
Bosch Magneto.
Warner Auto-Meter.
Demountable rims.
Extra rim and holders.
Tally-ho horn.
Jiffy curtains—up or down instantaneously.
Top and Top Cover.
Windshield.
Rear view mirror.
Tool-kit, Jack, Tire Repair Kit, Pump.
Robe Rail.

R-C-H Comes Out With Flying Colors Under Severest Test

The absolute dependability of the R-C-H under any and all road conditions was thoroughly demonstrated once more during the 800-mile Non-Stop Reliability Run held under the auspices of the Buffalo Automobile Club September 11 to September 14.

It was essentially a hill climbing test as, except during a portion of the last day, the route was up and down the steepest and sharpest grades to be found. In fact, the committee announced that **some of the roads embodied in the Run had never before been covered by automobiles.**

The R-C-H was the heaviest four-cylinder stock model car in the run and had at all times four passengers and enough extra equipment in the way of tires and accessories to make up a full five-passenger load.

Some idea of the grades encountered may be obtained from the fact that one six-cylinder car had to be towed up one of the hills; and another entry—one of the highest priced cars in America—stripped its gears on this same hill.

The R-C-H went through the entire Run without a single brake adjustment and without any kind of mechanical defect or breakage. The light wear on the tires, too, is demonstrated by the fact that not a single tire was changed during the entire Run, nor was there the slightest bit of trouble.

The only penalty suffered by the R-C-H was nine points for taking water outside the controls, which was due to the radiator leaking slightly.

The record made by the R-C-H in this Run proves—that over any kind of roads and in any kind of going the R-C-H is thoroughly reliable and dependable, and that it is at the same time the most economical car both in tire wear and fuel consumption.

Two Passenger Roadster, 110 inch wheelbase, $900, f.o.b. Detroit
Three Passenger Coupe, 110 inch wheelbase, $1300, f.o.b. Detroit

To win the fiercest war ever known to motordom, the MICHIGAN "40" enters the field with every big selling feature—electric lights, four forward speeds, extra size tires, complete equipment—at a price no other maker will meet—

$1,585

The Fight of the Forties

There are 72 makers in a fight for supremacy, with cars around 40 horsepower.

Most of the ablest engineers now give their whole thought to "40's." And some of the finest, most luxurious cars ever built are now in this class.

Yet the prices on Forties, since this war began, have practically been cut in two.

Into this fight comes the Michigan after four years' preparation.

And the offer we make outbids every rival, and every man who knows will concede it.

300 New Features

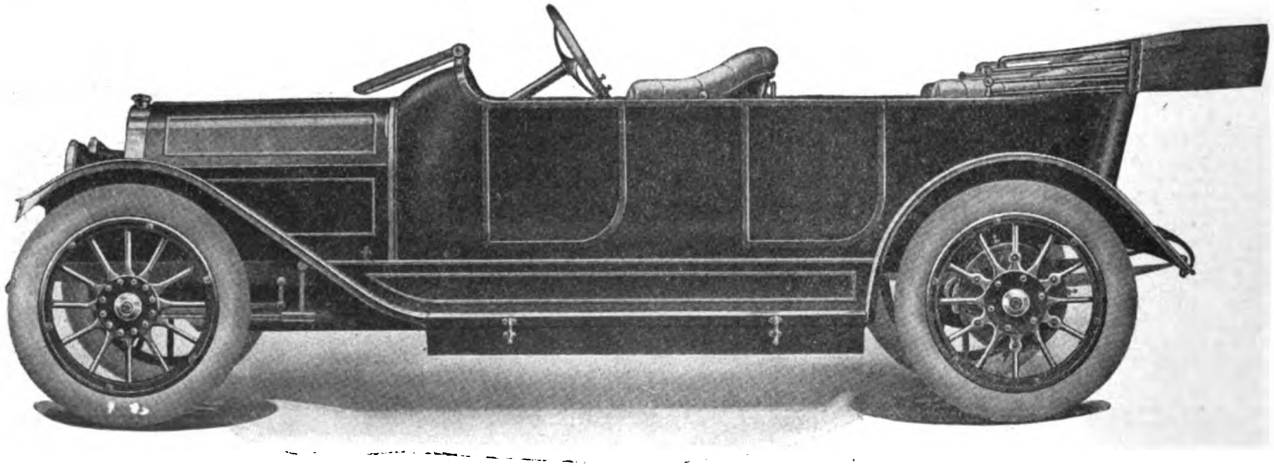
We have built 5,000 cars and have carefully watched their performance.

We have worked out in the past four years, more than 300 improvements.

We have brought to bear on this car some of the best brains in the industry.

Every engineering advancement has been noted and adopted. All the comforts and luxuries have been sought out and included.

Now, in this day of luxurious Forties, we believe that the Michigan outrivals them all.



A Wonderful Price

The Michigan factory now has enormous capacity. Every detail of the car is built by modern machinery.

Through wondrous efficiency the cost of this car has been cut 30 per cent in four years.

Part of this saving has gone into extras. Part has been taken from the price. Now we offer this car with complete equipment at $1,585. And no other maker will meet it.

With this car at this price, the Michigan is bound to take first place among Forties. You can prove that in an hour's comparison.

Digitized by Google

Michigan "40"

Cameron's Greatest Car

To W. H. Cameron, our designer-in-chief, is due the main credit for the Michigan "40." Cameron has built 100,000 successful cars, and all he has learned makes possible this wonderful machine.

To John A. Campbell this car owes its matchless body, its graceful lines, its finish, its upholstering. Campbell has designed equipages for kings, but this is his greatest achievement.

To an army of experts, selected by Cameron, we owe the strength, the simplicity, the over-capacity of every important part.

These men have combined to produce a wonderful car. And you'll find no car that excels it.

Remember these men when some maker tells you that his higher price buys something better. This is Cameron's best, and Campbell's best. No designers have ever excelled them.

Get All You Can

It is up to you this year, if you are buying a "40," to get all that you can, and pay the least that you need to.

Make careful comparisons. Watch the points that count.

Require big tires—as wide as the Michigan's—for that is the secret of small upkeep. Get four forward speeds, for the world's best cars now have them.

Get electric lights with dynamo. To add them afterward would cost $125.

Get a roomy car. Compare width of seats, size of tonneau, length of wheel base. Get a comfortable car. Note that Michigan cushions are 14 inches deep. Michigan springs are wide and long.

Compare the brakes, the axles, and every vital part. Here you should have big margins of safety—ample for 60 horsepower.

Compare all these things which mean care and cost, and you'll find no car in the Michigan class that comes anywhere near the Michigan price.

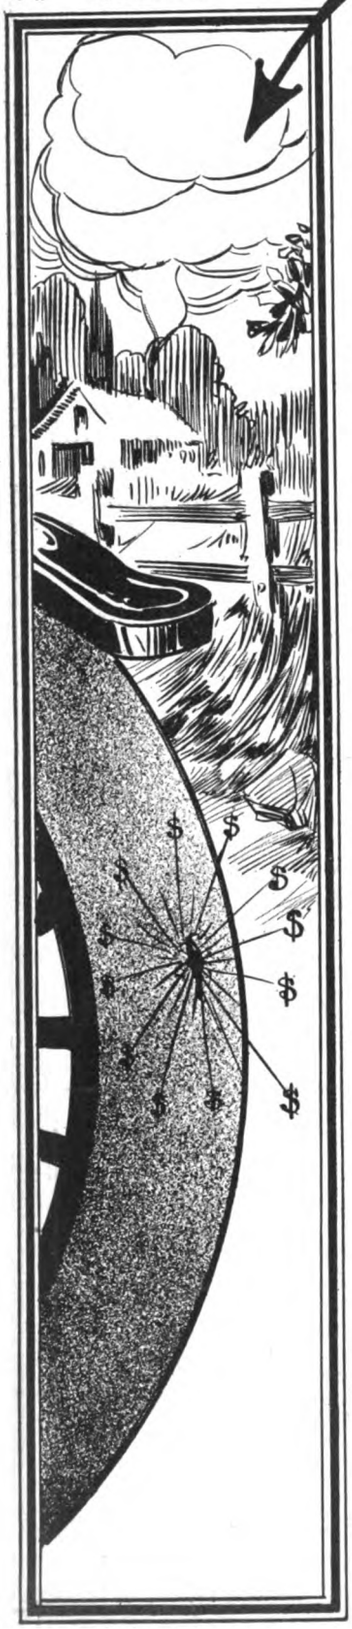
Send for our catalog, giving all the details, and showing the various bodies. Then we'll tell you where to see the car.

MICHIGAN MOTOR CAR COMPANY, Kalamazoo, Mich.

Owned by the owners of the Michigan Buggy Company

Some of the Michigan Features

Four-forward-speed transmission
Oversize tires—35x4½ inches
Electric lights and dynamo
Center control—left-side drive
Motor, 4¼ x 5¼
Extra effective brakes—16 x 2¼ inches
Big, comfortable springs
Adjustable steering post
Adjustable pedals
Firestone demountable rims — extra rim
14-inch cushions
Rear cushion 50 inches long
Hand-buffed leather upholstering
Best curled-hair filling
Wheel base 118 inches
Nickel mountings
Large over-capacity, giving big factors of safety
Pressed steel, full floating rear axle
Axles sufficient for an 80-horsepower car
Genuine cellular-type radiator
Best mohair top, side curtains and envelope
Windshield built in as part of body
Electric horn
$50 speedometer, 4-inch dial
Special foot rail
Swing robe rail
Rear tire irons
Complete tool equipment
Tool chests under running boards



There is such a difference of opinion about the various types of self-starters that we have not adopted any one type as regular equipment. We prefer to leave this selection to the buyer. We equip with either the gas or a positively efficient electric starter at a moderate extra price.

Two Kinds of Blowouts

And too many of these

will make these impossible

Now, Honestly, Mr. Car Dealer, Do You Believe in Looking into the Merits of an Article, Which Just Possibly May Be of Value to Your Customers?

When you want to sell a Car the biggest snag you run against is Tire Expense. You can't help that. If the man is a little doubtful about buying his car he is going to hesitate longer before giving you his order.

The automobile using public know what tire expense is. They know that it pays to repair tires and take care of them.

Why not get a little inside information on this subject so that you can talk to them advantageously about something in which they have already shown their interest—incidentally this information will help you overcome their objections.

Influence your customers to use Gilmer Tire Repair Pliers, and tire blow-outs will be practically eliminated on their cars.

It is no stretch of imagination to say that the use of Gilmer Tire Repair Pliers, in many cases, will double the life of your customers' tires, for Gilmer Tire Repair Pliers prevent the small cuts and abrasions from growing and developing into blow-outs that ruin the tire. Gilmer Tire Repair Pliers enable the operator of the car to thoroughly cleanse the numerous small cuts and abrasions to which his tires are constantly subjected, clear to the fabric—and then to insert pure, clean rubber gum, so that the cuts in the tire automatically close over this rubber, force it firmly against the fabric, and make the repair as strong as the original uncut tire.

Send to us today for our Dealers' proposition. We have some open territory that will enable you to make money.

"The Horn that's Made for the Discriminating"

TUTO HORN

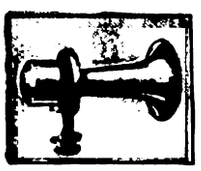
THE TWO TONE HORN

Loud Signals Do Not Promote Safety.

THE great success of the dual service of the TUTO horn has demonstrated that it is not necessary to provide an extremely loud signal noise in order to promote safety in signalling.

¶ The low note of the TUTO horn is effective fully 90% of the time and completely displaces the bulb horn, while the louder signal is only necessary in cases of emergency. It requests the right of way in a low but firm tone and without undue disturbance, leaving the loud tone free for the one purpose—the emergency signal.

¶ The effectiveness of this loud note is enhanced by the fact that it is used less than 10% of the time and therefore commands attention.



¶ Other horns, having only one loud note, must be reserved for emergencies, otherwise the familiarizing of the sound by constant use in regular service will defeat the very purpose of the emergency signal.

¶ When these other inflexible, one-note horns are used for emergencies only, a duplicate horn of low tone is necessary for regular service. Decency on the part of the car driver as well as laws and ordinances in various parts of the country, demand that the loud horn be reserved for extreme emergencies.

¶ Thus, when the one loud note electric horn is employed, it is necessary to supplement it with one of less power for regular service, requiring that two separate horns be mounted on the car and that separate points of control, such as two buttons or a button and a bulb, be mounted within reach of the driver. The going from one button to another or from a bulb to a button, is absolutely impossible in the case of an extreme emergency. Therefore, such a duplication of warning signals is confusing and of little utility for short range service.

¶ For safety in signalling, ease of operation, positiveness in action and neatness of installation, the TUTO horn offers the maximum of value. There is no one-half value or 10% service with the TUTO. It does all of the signalling of the car, and is 100% in service efficiency.

¶ The TUTO is the only two-tone horn—patented—so that no mistake can be made in specifying it for regular equipment on a factory output or for individual equipment on your personal car.

Announcing

To Electric Car Owners

12% More Miles On Battery Charge

12% More Resilience —The Ride Supreme

Firestone

Clincher Cushion Tires

Fit Pneumatic Rims, Standard Clincher or Quick Detachable Clincher

TWELVE per cent more miles for every charge of your battery; the current economy of the ordinary electric pneumatic tire without the bother and expense of tire troubles.

And Resiliency, Comfort, Riding Pleasure never before approached in solid tires. We have the proofs, substantiated by test in America's leading electric car factories.

These proofs are obtained, before tire leaves our factory, by scientific tests. The tire on the wheel must measure to the standard established by exact road and load conditions. Get these procfs!

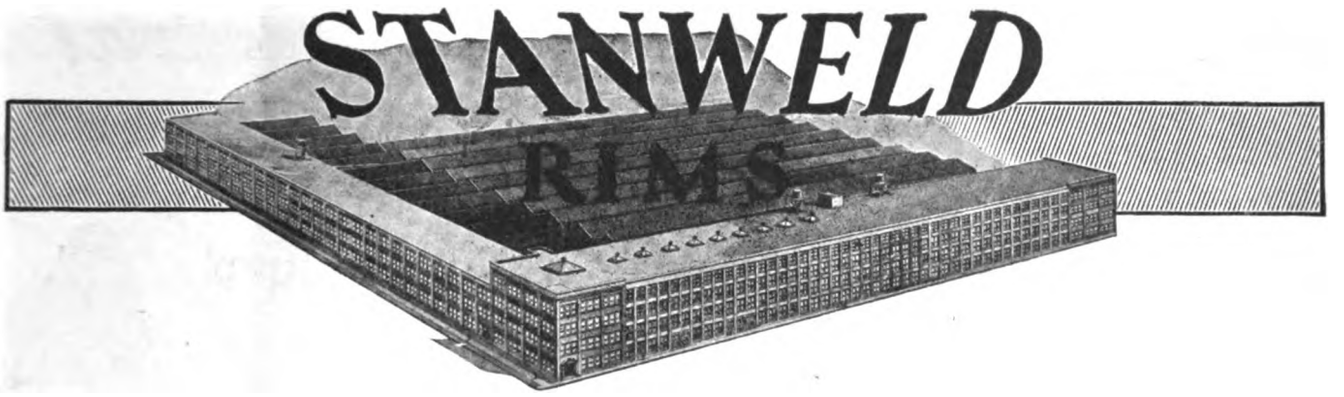
No matter how your electric is now equipped; you can quickly, easily and economically change to these Firestone Clincher Cushion tires without changing wheel or rim.

These tires are the ultimate accomplishment in solids.

The make-shifts of holes and blocked-out sections which substitute jerky spring and jolt for uniform resiliency are abandoned stages in Firestone evolution.

The over-hang design, the scientific proportioning of the Firestone Clincher Cushion, supported by the continuous body of Firestone supreme resiliency, make level ground of car-track or other obstacles.

Dual tread, in addition to increased cushion, gives secure protection against skid or slip. One section of tire prepares dry gripping surface for second section. Get our electric tire catalog and be convinced by the facts and figures based on scientific and practical proof.



Direct Service Stations In All Cities

Call at the Firestone branch or agency in your city or town and have them equip your electric *now* and keep it equipped at a minimum cost for maximum service.

Opportunity Knocks at Every Man's Door Once

Are You Listening for the Knock Mr DEALER, or are You Taking Your Daily Nap?

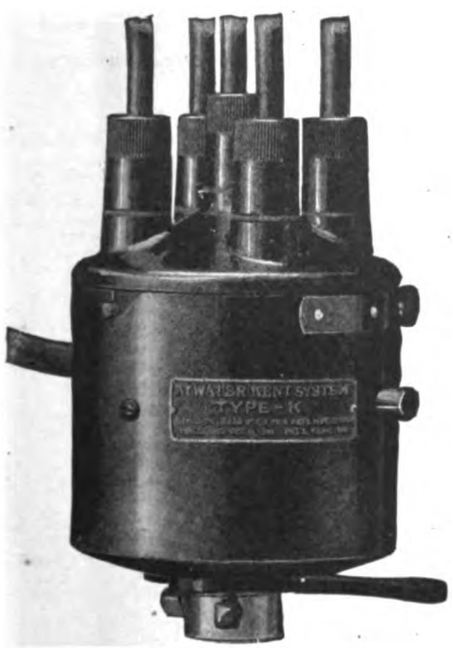
We don't quite agree with the artist who drew this illustration—at least so far as Opportunity's work for us is concerned. We have been sending her out with this Warm Hand Wheel proposition for a number of weeks—and she has been finding plenty of investigative dealers with the door wide open.

It is the live, aggressive, investigative dealer who achieves the greatest measure of success. There are two other types. First, the ultra optimistic who loads up with unsaleable stock; second, the ultra pessimistic dealer who considers every improvement in his line unsaleable. The ultra optimistic has his shelves filled with dead stock—the pessimist has empty shelves—both lose.

The Warm Hand Wheel is a success—wherever it has been introduced it is selling. Wise dealers recognize its value even before they see it. It is good for the investigative dealer—for the fellow who buys everything—for the fellow who refuses to handle anything.

Opportunity is knocking at your door, Mr. Dealer, and she bears a practical, common-sense device that will rob winter driving of half its terror.

Think this over—here is a heated steering wheel that can be put on any car in twenty minutes' time. Once installed it is always ready to give comfort and satisfaction during the coldest kind of weather, as well as in those seasons of the year when the frost nips the fingers.



Your opportunity is here to go on record as selling a proposition that will appeal to every driver of pleasure car or truck in your vicinity. If you refuse to investigate then be sure there is somewhere near you the "dealer from Missouri"—he is going to be shown and we are going to show him. You had better get in line now.

Omaha.....Omaha Rubber Co.
Chattanooga.....Sanford Bros.
Dallas.....Fisk Co. of Texas.
Denver.....Auto Equipment Co.

Of extreme interest to every motorist

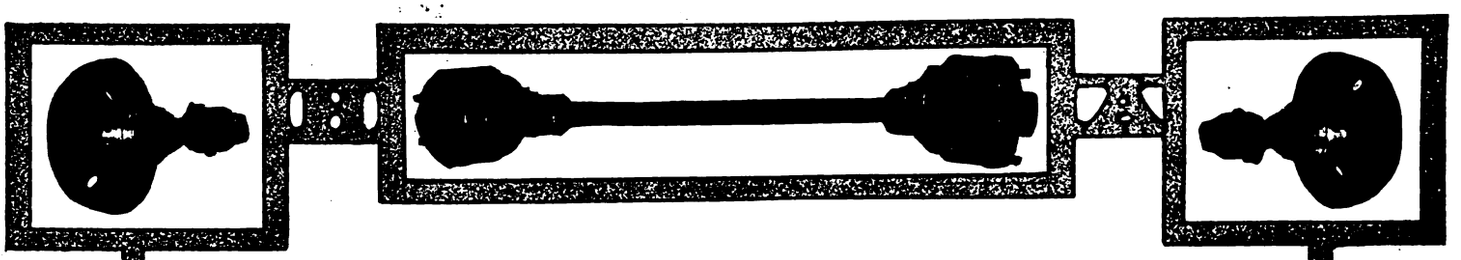
THE Automatic Spark Advance feature of the Type "K" Atwater Kent System is a long stride forward in ignition practice.

With this device, the control of the spark timing is entirely automatic (although the hand lever can be used if desired). This means that the spark is always properly timed to get the greatest possible power from the motor at any speed from three to seventy miles per hour.

No human mind can follow accurately the speed variations in an automobile motor and accordingly regulate the spark setting to get the best results.

The automatic spark control of the Atwater Kent System is more than human in its performance—it is sensitive to the slightest variation in speed—immediate in its response and positive in its action. The operator can forget his spark lever, knowing that his spark is being better regulated than he can do it himself.

The increased safety due to the automatic retarding of the spark for starting is alone more than sufficient to commend it to the modern motorist.



The Type "K" System is especially adapted for use in conjunction with lighting and starting equipment, or as sole ignition in place of the high-tension magneto. We regard it as being fully up to the high standard of merit for which Atwater Kent equipment is known.

Interesting Booklet D and detailed information sent upon request.

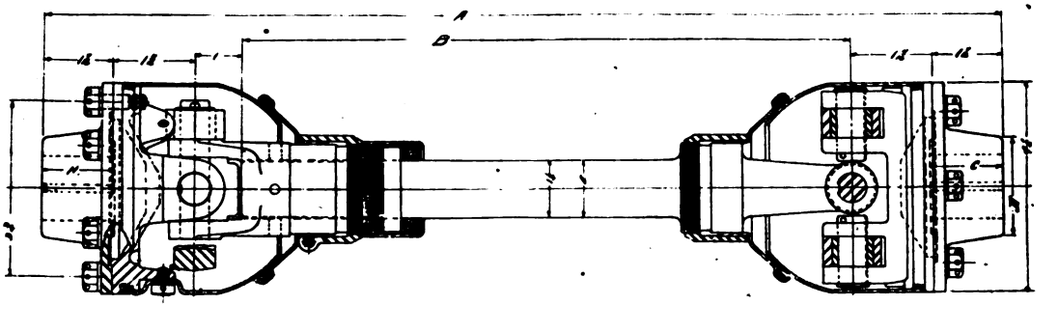
New Light Car Universal

We are presenting here another member of our growing family of Universal Joints, Type F-300 Drive Capacity 25 horsepower.



This installation is particularly suited to light cars and like all Hartford products, it embodies the highest degree of efficiency.

Note that high carbon steel drop forgings are used throughout with working parts hardened and ground to gauges with very close limits consistent with the work they are to perform.

Type F-300 drive is absolutely interchangeable and will give a greater factor of safety than usual with ordinary drive and it will successfully meet and withstand an unusual amount of overload and abuse.

Are you in the market for such a drive at this time, or will you be in the near future? If so, communicate with us and we will, if you desire, have our representative call to go into consultation with you.

Forthcoming advertising will give details concerning other types of universal joints.

SPECIFICATIONS:

A—Total overall length of complete drive.
B—Center of T-Head to end of square. Made to any length specified.
C—Length of Rear Hub, Standard 1½". Maximum length 1½".
D—Diameter of Transmission Hub, Standard 2⅛".
E—Diameter of Propeller Shaft 1¼".
F—Width across flats, Standard 1", 1⅛", 1 3/16", 1¼".
G—Width across corners, Standard 1¼", 1 7/16", 1½", 1 9/16".
H—Length of Transmission Hub. Standard 1½". Maximum length 1½".
I—Diameter of Straight Round Hole or Maximum Diameter Taper Hole.
J—Taper per foot: Standard 1½", ½", ⅝".
K—Keyway. Standard ¼"x⅛". 5/16"x5/32", ⅜"x3/16".

GASOSAVA

The Wick Does the Trick

Saves From 30% to 50% Gasoline

Increases Power up to 40%

Eliminates Carbon Troubles

Keep Soot From Spark Plugs

Dealers—It Retails for $3

This is a Live Seller for Live Sellers

and you know, Mr. Dealer, how responsive your trade is to the little things on the car that accomplish big things.

Gasoline Comes High

It is one of the biggest expense items in the running of the car and if you can locate a car owner in your territory who will not pay $3 for a device that we guarantee to save as high as 40 per cent. on his fuel bills—give us his name.

Your Trade Needs the Gasosava

because it means economy of fuel, conservation of speed, power and flexibility and freedom from carbon trouble. Install it on any car and the owner will be your firm friend—and that means more and bigger sales for you.

Easy to Install

Simply insert Gasosava between carburetor and manifold (just as you would a gasket) and screw up tight.

Write today for our general agents' proposition and territory.

Knox

MARTIN TRACTOR

Maximum Carrying Capacity
Minimum First Cost
Minimum Maintenance
Minimum Turning Radius

What It Is

Not a Theory But a Proven Success in a Year's Gruelling Work. Many in Successful Operation. 5 to 10 Ton Capacity. Full Details Explained in Tractor Catalog. Send Today.

A motor unit that may be attached to any heavy vehicle designed to be drawn by horses; the combination making a five-wheeled motor-drawn vehicle.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE COST OF RUBBER TIRES. Wagons have been doing good work for many years on steel tires and there is no reason why they will not continue to do so when drawn by the tractor; the heaviest part of the load is always carried on steel tires.

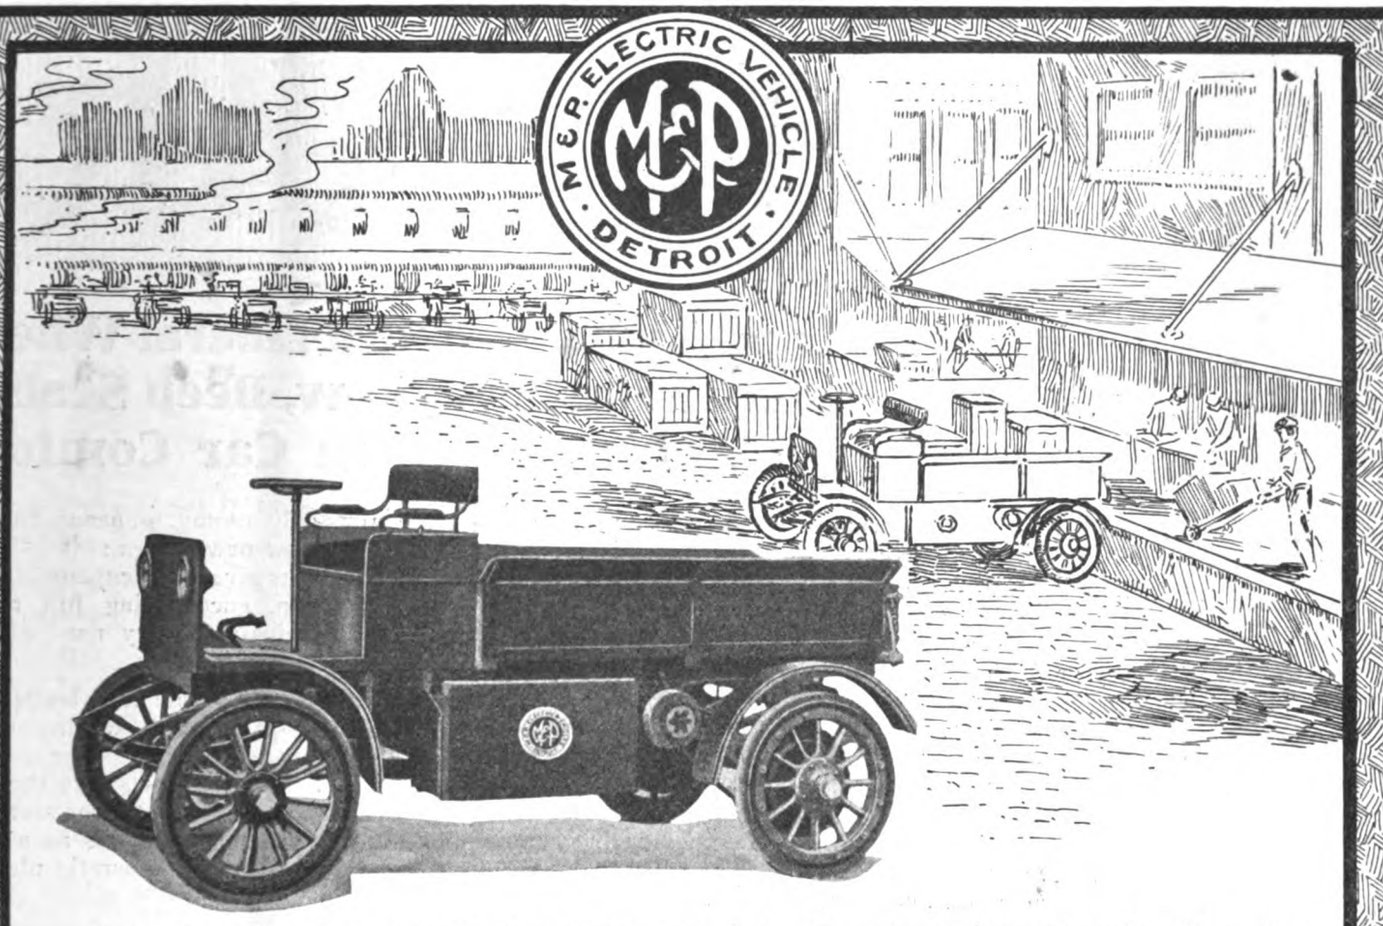
IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE VIBRATION ON STIFF SPRINGS. All working parts of the tractor are carried on springs as resilient as those of a pleasure car.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO SUDDEN STARTING OR STOPPING OF HEAVY LOADS. The cushioning of the shock between the engine and the load is one of the most important advantages gained, (fully explained in catalog).

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO NEGLECT ON ACCOUNT OF INACCESSIBILITY OF PARTS—all parts of the tractor being more accessible than on a touring car.

IT SAVES HEAVY MAINTENANCE CHARGES due to frame twist. The tractor accommodates itself to all road unevenness.

The single front wheel can be turned at 80 degrees angle, enabling the driver to back to any position or turn completely around in the narrowest street.



A Knox Martin Tractor costs less than a two-ton truck; has a capacity of 5 to 10 tons.

KNOX AUTOMOBILE COMPANY (Tractor Department) Springfield, Mass.

BRANCHES—New York, Chicago

AGENTS—The Knox Martin Tractor Is the Greatest Proposition in the Commercial Field Today. Fully Protected by Patents.

Digitized by Google

Present orders from our dealers prove our first advertised contention, in effect that there is a fast growing demand for an electric light delivery truck, sold at a price within reason.

The M & P One Thousand Pound Electric is filling this demand just as fast as we can turn out the orders, and up until this time we are keeping pace.

You Ought to Sell the M & P Truck

and you can sell it, for in your territory there are many concerns now using horse-drawn delivery wagons who can be shown the business-building economy of the M & P Electric Truck.

Here Are the Facts

This truck carries a normal load of one thousand pounds with a safe margin for excess weight. It is the last word in electric truck design embodying every feature that conduces power, economy, flexibility and simplicity.

It will render more and better service at less cost for operation and upkeep than will any gasoline delivery wagon costing seven or eight hundred dollars more—make us prove this.

Its operation is devoid of complication—any boy can run it after a very brief period of instruction.

All parts are standard and interchangeable, although on account of sturdy construction and the large margin allowed for safety on all parts, the necessity for replacing parts is reduced to a minimum.

A Big Opportunity

Now, Mr. Dealer, this truck sells stripped for $1450—with Express Body for $1500, with Enclosed Body for $1600. And you will find after the first sale has been consummated that there will be other merchants in your vicinity who will at once see the advisability of replacing the horse-drawn wagon with an M & P Electric.

Write and let us tell you of the exceptional proposition we have to offer. It is one you can ill afford to ignore.

M & P ELECTRIC VEHICLE COMPANY Franklin and Dubois Sts., Detroit, Michigan

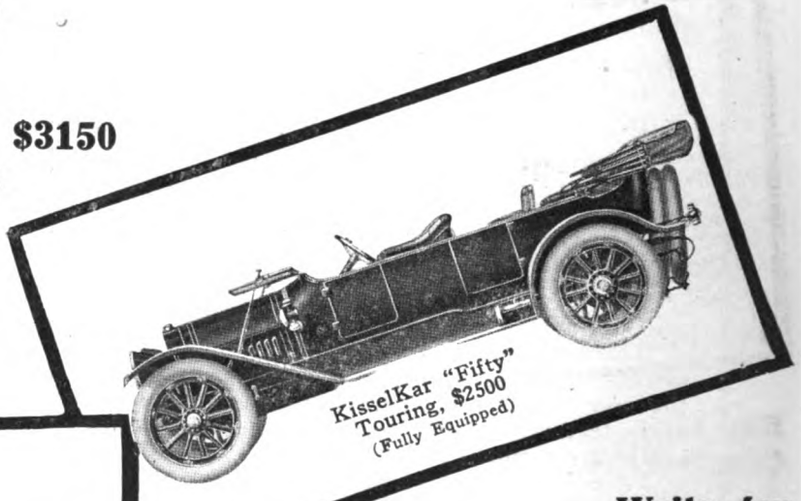
KisselKar

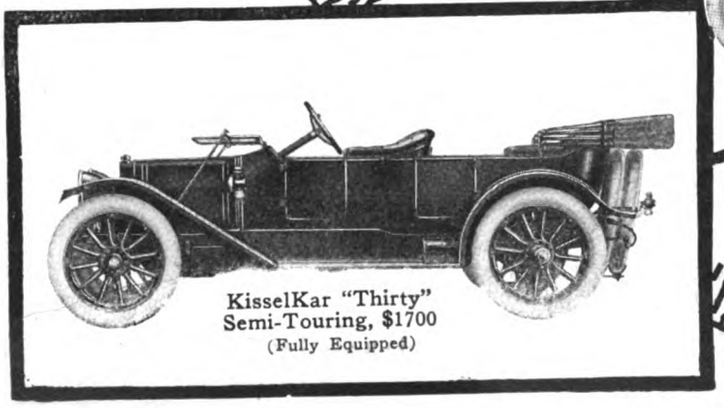
Electric Started and Lighted—Extra Liberal Wheelbase—Extra Roomy Tonneaus—Low, Deep Seats—A New, Distinct Achievement in Car Comfort.

The 1913 KisselKar surpasses every previous idea of car comfort. Every factor of comfort is incorporated in the 1913 KisselKar to a liberal degree not before equalled in any other automobile.



Every model has an extra generous wheelbase, which, besides emphasizing the low, rangy design, bridges the irregularities of the road in a way that gives the KisselKar a steadier, milder and conspicuously rare riding comfort.

Big wheels, big tires, shock absorbers, springs designed according to weight of each model, and eleven inches of seat upholstering absorb the road vibration. The liberal wheelbase permits the unusually roomy tonneaus and the extra depth of the low new design seats. These exceedingly deep seats give the occupants a quarter-reclining position, encouraging full restful relaxation, and eliminating every need or tendency to brace against sideway.



The new construction of the 1913 bodies, the graceful outbending panels, the swelling curves which replace edges and corners—the general modeled effects of the new bodies give the 1913 KisselKar the distinction sought after since the automobile has been considered less as a mere machine and more as the artistocratic pleasure vehicle of modern life.

"Thirty" $1700
"Forty" $2000
"Fifty" $2500

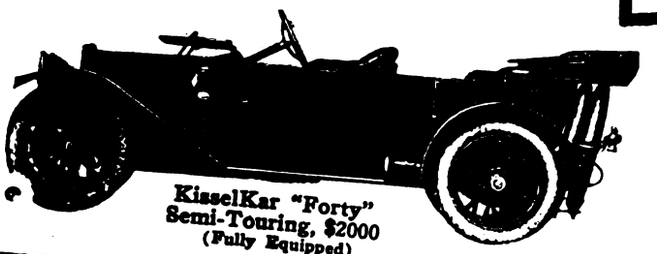
1913

Flexible Power

The flexibility of the motor gives the KisselKar a wide range of throttle control, which makes all ordinary driving a mere matter of shifting the throttle lever or pressing the foot accelerator. You can throttle down on "high" to a creeping pace in traffic and take hills at easy, normal speed without rushing, or shifting gears. Gear shifting with a KisselKar is occasioned only by extremely difficult road condition. For all average driving, the flexible KisselKar motor drives smoothly and silently on "high" gear as fast or as slow as you want to go.

The KisselKar electric starting and lighting system is perfected and refined.

The slightest touch to the foot lever in the driver's compartment starts the KisselKar. No chance of a starting failure. A full year's exhaustive testing has proved the KisselKar electric self-starter to be dependable under all conditions of weather. It requires no attention—brings no extra strain on the engine. It is powerful enough even to run the big 60 H.P. "Six" considerable distance.



A touch of the foot lever causes the electric motor to turn over the engine vigorously. Then when the engine is running under its own power, the electric motor cuts out and the electric dynamo cuts in, charging storage batteries for ignition, lighting and future starting.

Electric lights more than twice as powerful as ordinarily used on automobiles are a feature of the system.

The KisselKar electric system is mechanically refined in every detail—the **perfected electric** starting and lighting system.

KisselKar 60 H.P. "Six"
Semi-Racer, $3150
(Fully Equipped)

KisselKar "Forty"
Semi-Touring, $2000
(Fully Equipped)

Big Line of Commercial Vehicles

The KisselKar commercial line includes 1500-lb., 1, 2, 3, 4, 5 ton trucks, **delivery wagons,** fire department apparatus, omnibuses, etc. All type bodies—**special bodies designed** and built to meet the needs of any service. KisselKar Trucks have capacity and reserve power to meet extremest demands. Competitive road tests have demonstrated KisselKar Trucks to be from 15% to **20% more economical** of fuel than average trucks. Lock on differential equalizes power between rear wheels, so that a slipping wheel can not absorb all the power and stall the truck.

KisselKar Service

KisselKar service is supplied and directed by the manufacturers. Specially constructed and equipped buildings at principal points of the United States are maintained as service-centers, co-operating with selling representatives in giving a complete detailed service to every KisselKar owner. This national organization of service-centers brings the owner in close touch with the manufacturers. The result is unusually low running cost, low maintenance and slow depreciation, and the fullest realization of motoring pleasure. Following is a partial list of KisselKar branches and agencies:

Boston New York Chicago Milwaukee
Kansas City Los Angeles Minneapolis
St. Paul St. Louis Dallas

Philadelphia, Cleveland, Detroit, El Paso, San Antonio, New Orleans, Baltimore, Omaha, Butte, Denver, San Francisco, Seattle, Portland, Duluth, Buffalo, Pittsburgh, Hartford, Conn., New Haven, Albany, Troy, Montreal, Quebec, Toronto, Winnipeg, and 200 other principal points throughout America.

1913 Marion $1475

The Men Behind the Marion Are Men Who Have Done Big Things

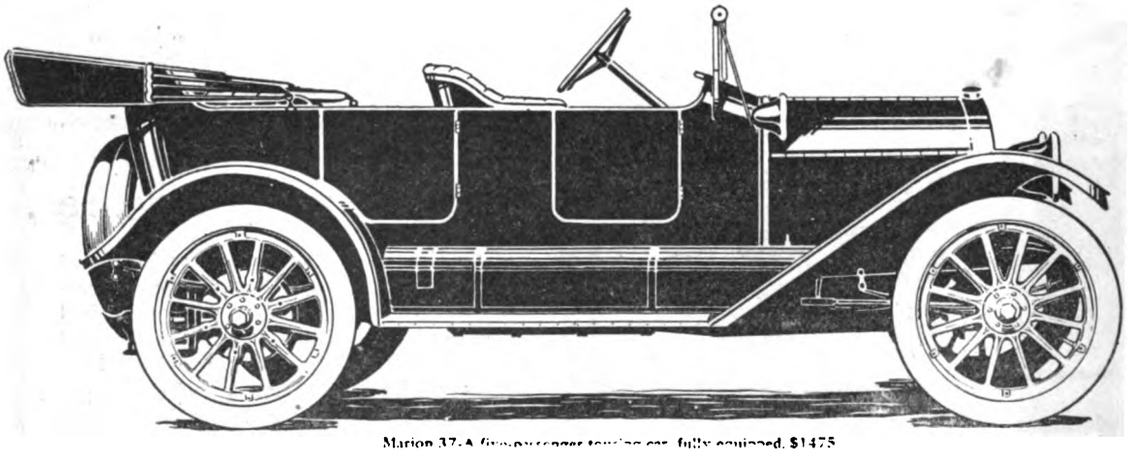
THEY have contributed largely—yes, very largely—to the successful building of eleven big strong automobile companies. Today the earmarks of their energy and ability are conspicuous in many of America's most noted cars.

They have now pinned their faith to the Marion, have banded together in the greatly expanded Marion Company, determined to make the Marion 37-A the greatest motor car value of the year. The Marion organization is genuinely co-operative. Every executive is a partner, drawing only a living salary. In other words, every one of them is staking his name, time, experience, brains and reputation upon the definite success of this car.

Moreover, they are winning. In fact, they have won. Their car is here! You can see for yourself what wonderful results have come from the united efforts of such a body of real workers.

This car shows for itself. Look at it. Measure it. Feel of it. Ride in it. You will find that its every line, its tone and refinement, reflect the genius of an able engineer. Its workmanship and finish prove the builders' wonderful attention to detail.

The high quality of materials, the generous proportions of the car as a whole—and the price—indicate the policy of a company building for the future as well as for today, and determined to give its patrons the fullest measure of real value.



You can boast of owning a Marion. Park it beside cars of the highest price and you will be proud of it. Quality is apparent in every line. In completeness of equipment, grace and dignity, beauty of finish, and strength and durability, it is a car which justifies our every promise to you.

It is a large five-passenger car with luxurious upholstering. Lots of width, lots of breadth. You have the option of rich brewster green or deep wine color—either is exclusive. Its metal trimmings are nickel plated, its wood trimmings mahogany. Long wheel base, and springs of flexible imported steel make it a car with exceptional riding qualities.

Of its mechanical construction you need have no concern. It has been simplified and refined through ten years of manufacturing. Its standardization is self-evident. Its superiority is proven by the fact that Marion owners are always touring.

For those who want a larger and more powerful car we build the Marion 48-A—$1850—fully equipped. For the "speedy boys" we have the famous Marion "Bobcat," a mile-a-minute roadster—$1425—fully equipped.

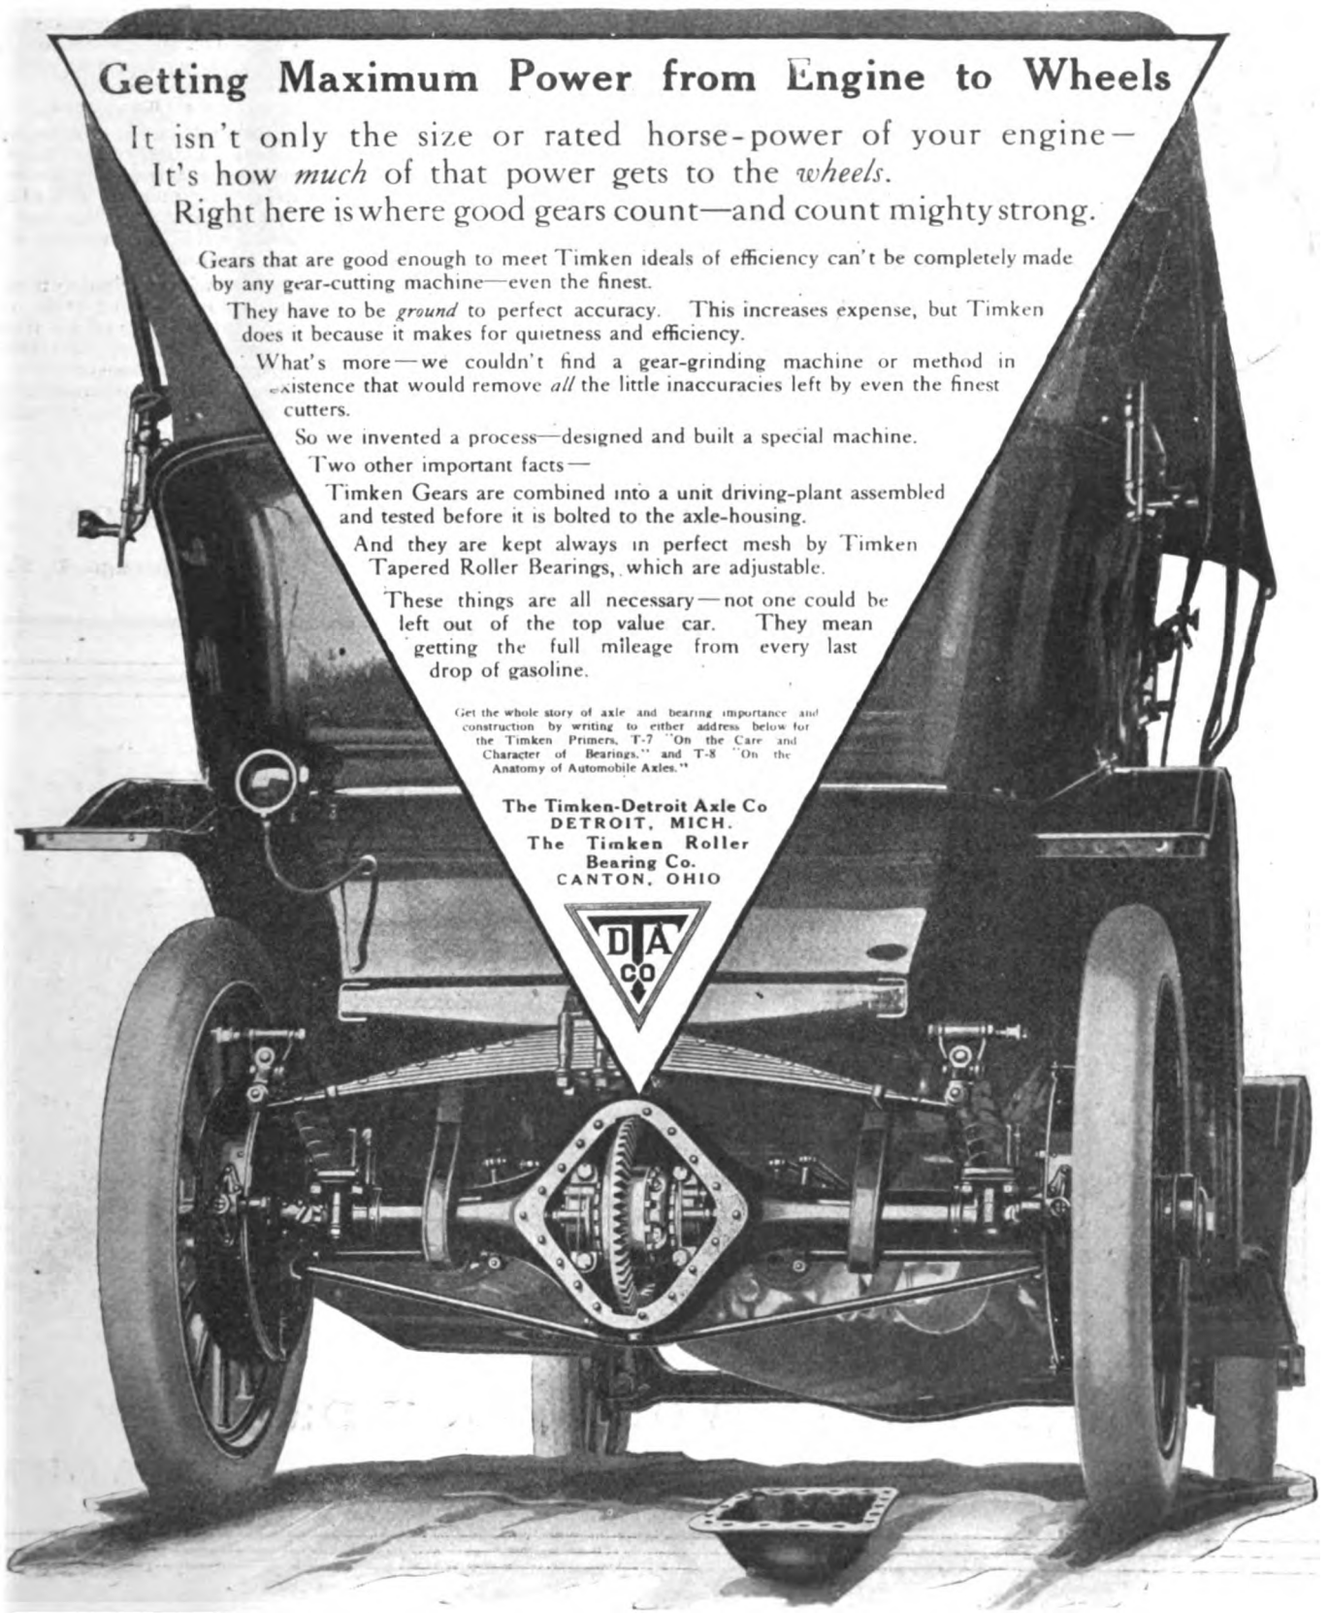
We can not begin to enumerate here all the points you will note and instantly like about the 1913 Marion line. Let us send you illustrated literature in regard to these cars, giving their full detailed specifications. Write to us today.

Marion 37-A five-passenger touring car, fully equipped, $1475

Important Features, Marion 37-A

UNUSUALLY COMPLETE EQUIPMENT: Disco self-starter; Prest-O-Lite tank; Warner speedometer; dynamo electric lighting system; Q. D. demountable rims, one extra; ventilating plate glass windshield; mohair top, boot, storm curtains; tire irons, tools; concealed tool boxes; nickel-plated trimmings.

MOTOR: Four cylinders, cast in pairs, long stroke, 30-40 horsepower; bore and stroke, 4 x 5 inches; dual ignition; automatic carburetor steering column adjustment; constant level oiling system (circulating); 3-point suspension.



CHASSIS: Wheelbase, 112 inches; cone clutch; 3-forward speed selective transmission; shaft drive; four double-acting brakes; artillery wheels, 34 x 4-inch tires; I-beam drop forged front axle; double trussed rear axle; front springs semi-elliptic, rear ¾ elliptic; strong steering gear.

To bona fide automobile dealers we offer the fairest sales agreement ever written. Ask us about territory. All Cars Guaranteed. All Fully Equipped. Prices f. o. b. Indianapolis.

TIMKEN
AXLES & BEARINGS

Getting Maximum Power from Engine to Wheels

It isn't only the size or rated horse-power of your engine—
It's how *much* of that power gets to the *wheels*.
Right here is where good gears count—and count mighty strong.

Gears that are good enough to meet Timken ideals of efficiency can't be completely made by any gear-cutting machine—even the finest.

They have to be *ground* to perfect accuracy. This increases expense, but Timken does it because it makes for quietness and efficiency.

What's more—we couldn't find a gear-grinding machine or method in existence that would remove *all* the little inaccuracies left by even the finest cutters.

So we invented a process—designed and built a special machine.

Two other important facts—

Timken Gears are combined into a unit driving-plant assembled and tested before it is bolted to the axle-housing.

And they are kept always in perfect mesh by Timken Tapered Roller Bearings, which are adjustable.

These things are all necessary—not one could be left out of the top value car. They mean getting the full mileage from every last drop of gasoline.

Get the whole story of axle and bearing importance and construction by writing to either address below for the Timken Primers, T-7 "On the Care and Character of Bearings," and T-8 "On the Anatomy of Automobile Axles."

Every Business Man Is A Prospect for the International Commercial Car

Every man who wants to make quick deliveries, who has to transport tools or material for his work, or who has any kind of light hauling to do, is a prospect for an International Commercial Car.

The selling field of this handy, dependable auto wagon is unlimited because of its general usefulness, and because it gives such universal satisfaction. Wherever a sale is made it helps to close others. The endless chain thus formed makes the selling of this car the best opportunity of the present time for automobile dealers who see the trend of the times toward motor cars as business wagons.

The International Commercial Car has been justly called the car of wide appeal. Grocers, bakers, laundrymen, florists, painters, decorators, carpenters, contractors, plumbers, and men in a hundred other lines of business buy this car because of its fair price, low upkeep cost, efficiency and economy.

Any dealer who will distribute our selling literature among the business men of his town, or the farmers of his neighborhood, and will follow up that literature with practical demonstrations of what an International Commercial Car will do, can make a gratifying success of an agency for this car.

We invite correspondence from live dealers who want to be shown. Address a post card to

REMY ELECTRIC STARTER

The Remy Electric Company of Anderson, Indiana, invites correspondence with automobile engineers who are interested in a perfected electric starting device. It will be offered in various combinations with either electric lighting or ignition or both.

We have added the world's greatest electric-starting-apparatus engineer to our staff. As the real "Father of electric starting," he brings the most intelligent experience to be found, to our own board of experts.

Our experience coupled with unlimited facilities makes it logical for us to offer the first perfected, the first commercially successful apparatus for starting the gasoline motor—the REMY STARTER.

"WHITNEY" Chains
Are Used by the Leaders

Every "Whitney" Chain has a reputation back of it, a reputation of having been tested in the most trying service and never failing to make good.

The "Whitney" Cotter Detachable Chain has made for itself a record, which no other detachable type has approached. The shortening, lengthening or repairing is a simple matter, as the chain can be easily separated at each link and parts removed or inserted without the use of any special tool. It is therefore the Most Practical Chain for Motor Vehicles.

When making replacements insist on a "Whitney" Detachable.

Talks on Selling Automobiles

No. 1

By the

Harman-Yount Co.

Kenton Harman, President

1788 Broadway, New York

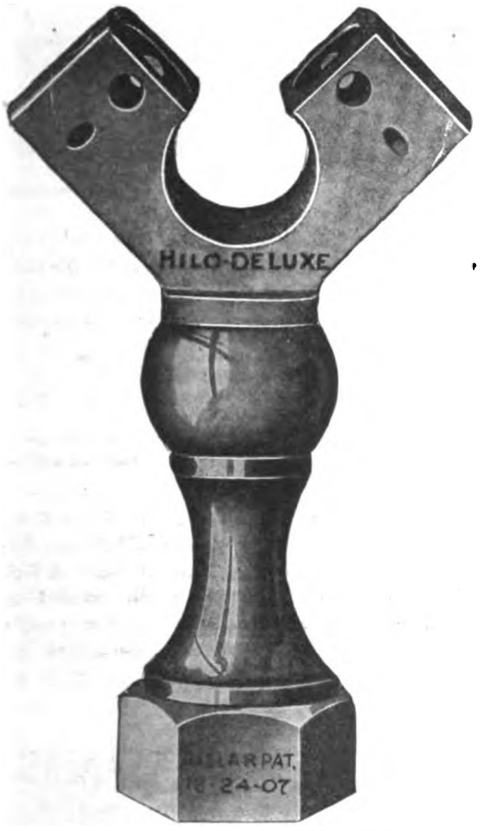
The credit system hurts your business.

Ties up a lot of money as active capital.

People you could sell cars to say—"I haven't the ready cash. I am carrying so much money on my books. Perfectly good, you know, but slow. Now, if you could—"

But you can't—that is to say, you cannot extend credit to more than a few. You have enough capital to "carry" hundreds—in some other business. But not in the automobile business, where every sale means $500 or more.

Right here we step in and turn the credit system around upon itself, paradoxically, and make it help you. Our business is financing sales of automobiles to responsible people, who can afford them, but lack ready money.



The manufacturer gets cash on delivery of the car. You get your commission at once, and the customer gets his car under the "easy payment" plan, paying us legal interest—not "installment house" rates.

You assume no risk. And we only extend Credit Where Credit Is Due.

Write today for details of how we can help you double your sales.

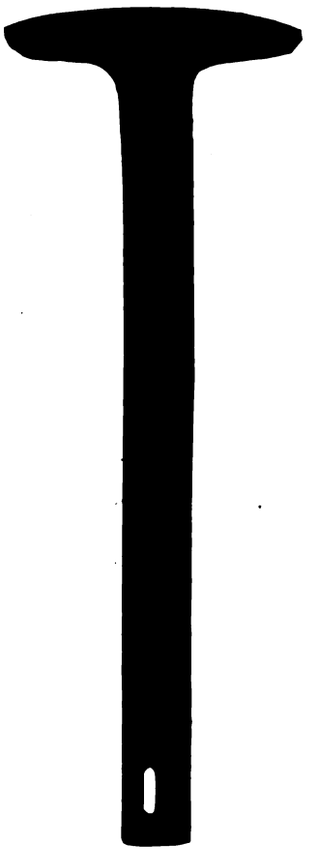
THINK THIS OVER

very carefully and read it twice, if necessary.

Is there any part of an automobile engine, or any other gas engine, that is more important to its efficiency than a Valve?

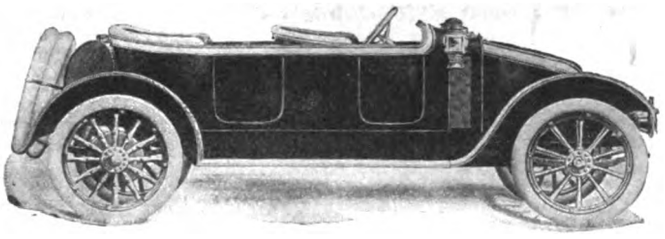
Your engine leaves the factory running smoothly and sweetly—tuned up to its highest power. Perhaps the valves pit—warp—go out of shape—fail to hold compression. Then the power diminishes, and what can be more aggravating to the driver, who has known the fullness of the pulling power of his motor, than to have it grow less and less?

You cannot slight this part by putting in an inferior product—valves that will give trouble, or even break from inexperience in their manufacture—valves of unsuitable material, not suitably heat treated.



Too much is at stake, and a slight extra cost at the outset, which is the exception, may save you many times over a probable later expense.

This Company, with the experience of many years as a guarantee, will furnish you with properly made valves, of the materials best adapted to your requirements.



Not only QUALITY, but efficient SERVICE is a factor—surely there is a satisfaction in getting the kind of work you want—when you want it.

The Features the Buyer Wants in Distinctive and Distinguished Cars

CROXTON

Croxton cars incorporate all of the features for which the buyer looks in the new season models.

Moreover, many of these have been in use on our cars for five years; so, with us at least, they are not experimental.

Others—which some day we predict will be widely adopted — are yet exclusive to the CROXTON.

These are even more valuable to you in a sales way than those which have now become more or less common in other cars.

A glance at what follows will show you that no car is more complete, of more advanced design or more completely equipped.

Short Turning Radius.

Extremely long and flexible Springs.

Quick Detachable Demountable Rims.

Electric Starting and Lighting System.

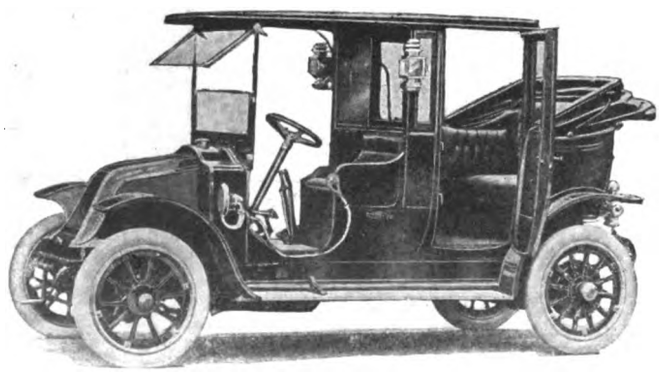
An extremely long stroke motor; improved ignition system with automatic spark advance, dispensing with spark lever on steering wheel.

Improved Thermo-syphon cooling system.

Radiator protected from damage and from mud and water splashing by being placed at rear of motor; no hot air from radiator passes over motor. Improved oiling system, left hand drive with steering gear of new design. Center control. Cltuch and transmission enclosed as a unit. Gasoline tank incorporated with cowl dash. Motor protected by hood from dust, dirt and water.

Particularly attractive and distinct body lines.

We are now located in our new factory, with the best and latest machinery, and most complete facilities



Our Sales Force is yet to be completed by the addition of a few good dealers.

Full details and specifications will be mailed for the asking.

The Croxton Motor Car Co.

Washington, Pa.

J. P. STOLTZ, President

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Wire or write us, no matter where you are.

Our PRICES compete with LEADING AMERICAN makes.

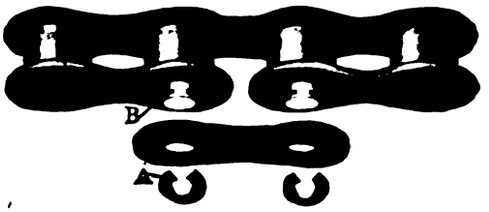
To Manufacturers of Motor Cars:

Have you considered the important advantages of using the American made New Departure ball bearings in your new models?



It is a significant fact that most manufacturers of motor cars have done so and after testing them out, have contracted with us for their requirements.

Take a short cut to a quick discussion of your bearing problems by sending us your blue prints and data. You will receive by return mail our catalogue-treatise, written by our staff of engineers. This will be followed quickly by a letter from our chief engineer frankly stating the result of his study of your bearing requirements, with a view to securing maximum efficiency at minimum installation and maintenance cost.

Write today. It will save your time and expensive experimenting.

INTERLOCK INNER TIRES
Stop Tire Troubles

The one weak point of the automobile is that you cannot depend on the tires. Thousands of motorists have solved their tire problem by discarding inner shoes, reliners, fillers and other makeshifts and equipping their tires with **Interlock Inner Tires.**

Interlocks are complete inner tires (not inner shoes) placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They double the mileage of new tires and add 1,000 to 5,000 miles to old ones—save half your tire expense—and make tires trouble proof.

Dealers and Motorists—Investigate Interlocks

Don't delay—write now for booklets, data, prices, testimonials of users, road tests, etc. Mention size and kind of tires you use.

PERFECT LUBRICATION and the elimination of noise are two features exclusive in HYATT ROLLER BEARINGS. The hollow, tubular roller becomes a reservoir for the lubricant.

FLEXIBILITY IS IMPOSSIBLE in solid rollers or balls. It's essential though, in reducing the noise in bearings. Hyatt Flexible Rollers absorb vibrations and cushion shocks.

The Motor Lamps with Distinctive Features

There are no other motor lamps on the market with the advantages of Solar Lamps. Solars are always exclusive in style and in quality. They are the strongest lamps as well as the most effective.

In no other lamps can you obtain the Solar Special Short Focus Lead Glass Lens Mirror Reflector—the patented system of double ray light projection which gives two distinct fields of light for town and country use—or the new and exclusive black finish with a metallic lustre which is unaffected by heat or moisture. All of these features are exclusively "Solar."

Do not equip your car or specify equipment to the maker until you have seen all of the Solar advantages. See Solars at any live dealer's or write for the catalog.

Solars are made in all styles for oil, electricity, gas and in combinations.

Weed Chains
The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires
Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

SHELDON

Brake Equipment E-11

New Features Unusual Steel

Highest Braking Efficiency

Material

BRAKE SPIDER AND PARTS . Best Steel Castings
RADIUS ROD SHANK . . . Chrome Nickel Steel
FORK . . . . . Drop Forged Steel

SHELDON manufacturing policy is based on a fixed formula—"Ninety per cent brains—ten per cent. material."

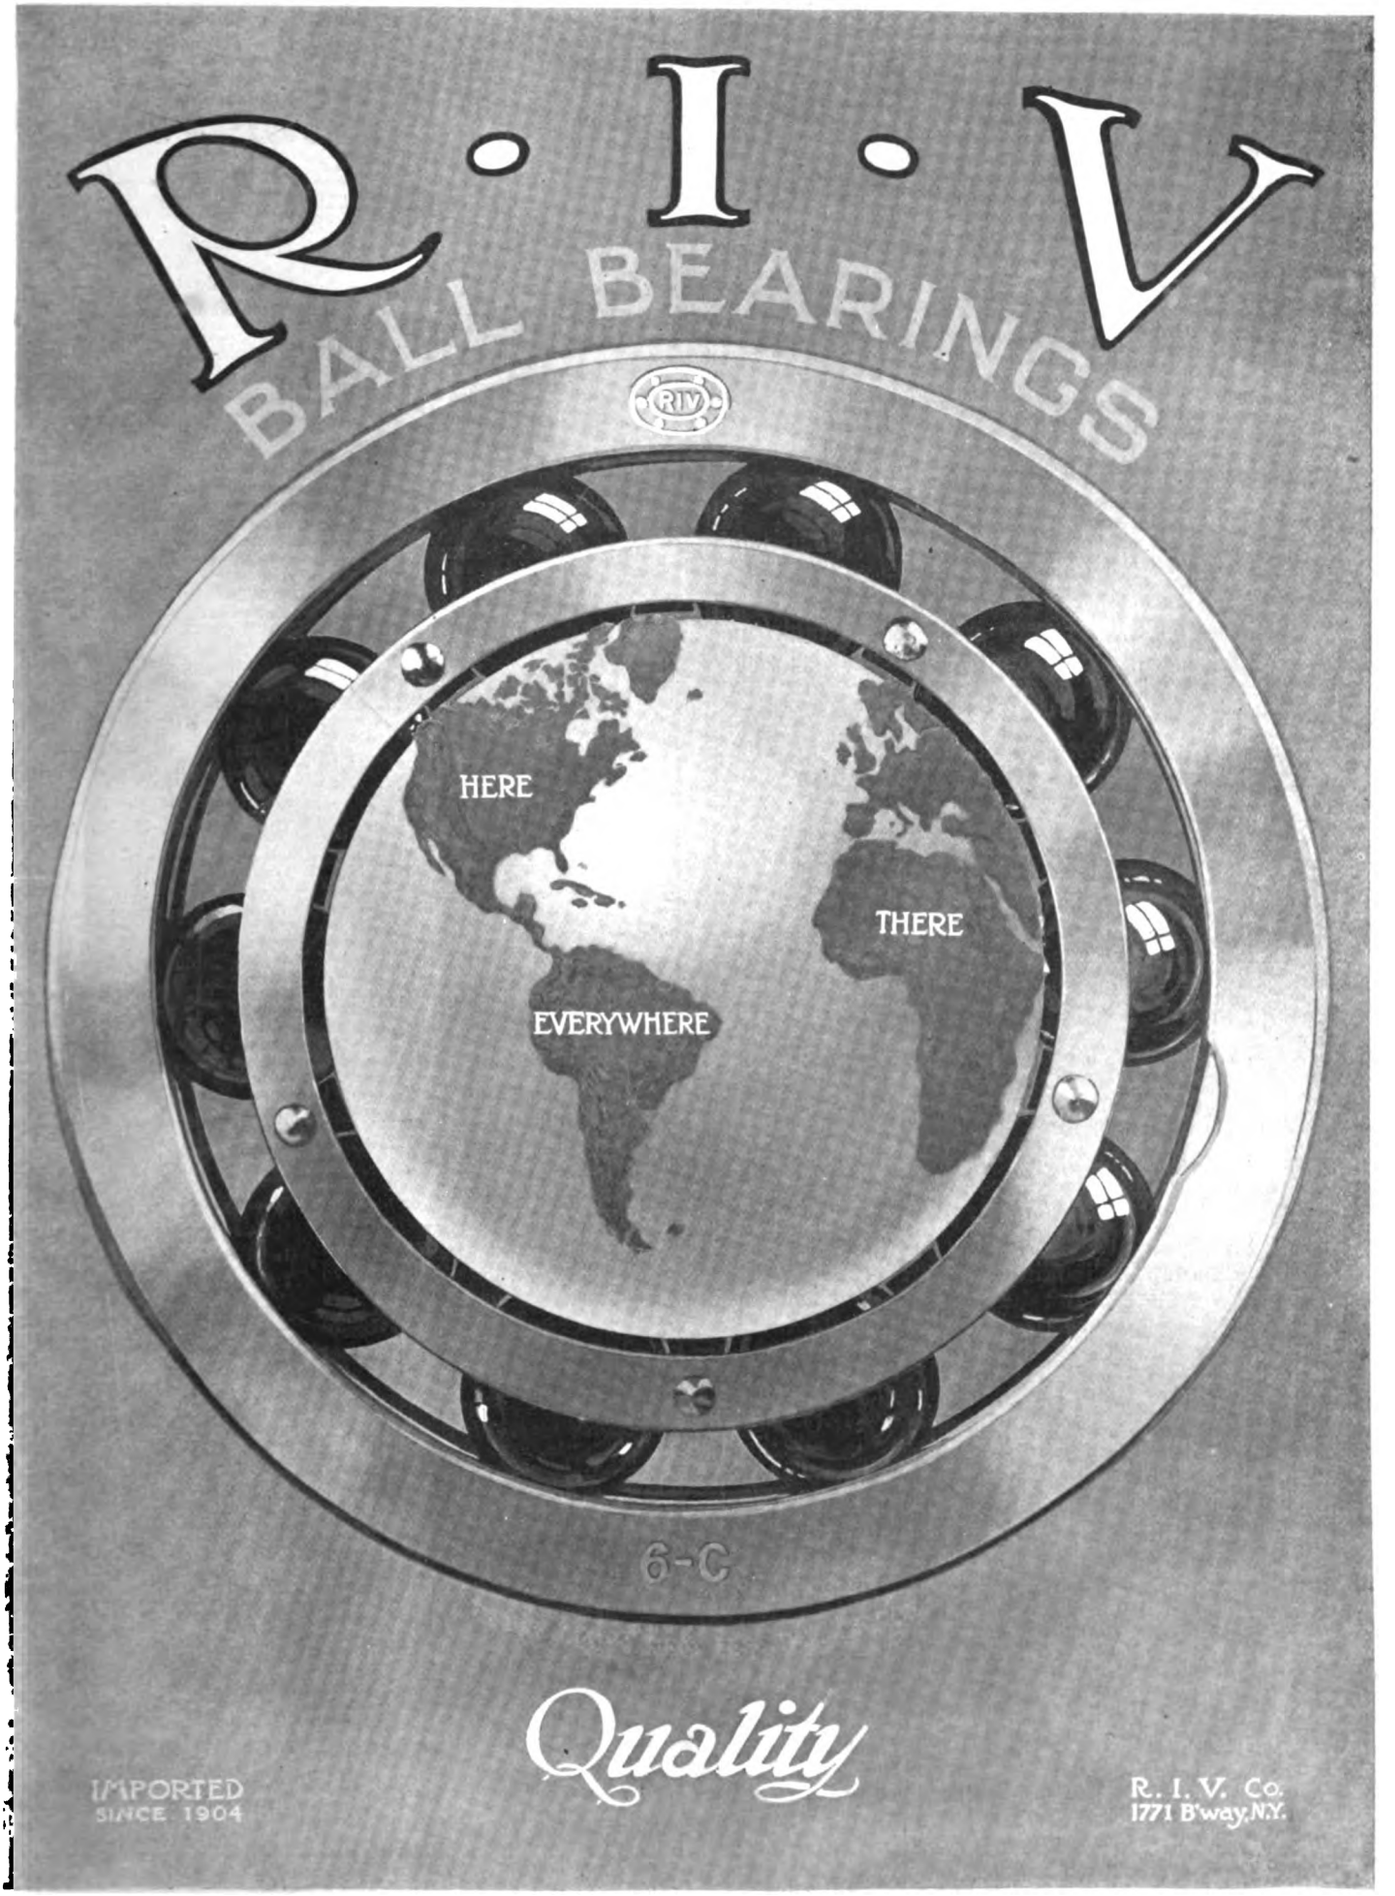
The material specifications shown above, represent ten per cent—it doesn't take much figuring then to get at the big percentage of quality of design and excellence of workmanship back of this out-of-ordinary truck brake equipment.

Design

Both brakes on rear axles—eliminating strain through chain and bending moment on jack-shaft. Inside and outside brakes of the "wrap up" or self intensifying type—giving uniform wear. Brake levers, pin and shaft designed to keep deflection at a minimum. No lost motion between pedal and brake band.

Performance

The various sections have been figured for a load of 3,000 pounds or 50 per cent. overload, 80 per cent being on the rear, and skidding the rear wheels.



A pressure of 50 pounds on the foot pedal will bring the truck to rest in the shortest possible braking distance, and under these exceptionally heavy strains we have a factor of safety of at least 4 to 1 in the material, which spells dependability to the last degree.

The E-11 Brake is the strongest, most dependable and lasting in the whole field of Motor truck brake equipment.

Safeguard Your Investment in Your Gas Tank

If you own a Prest-O-Lite Tank, you are entitled to Prest-O-Lite Service, and it behooves you to see that you get it.

If you allow anyone to force an imitation tank on you in exchange for your genuine Prest-O-Lite you lose just as much as you would if your genuine tank was actually stolen.

But you can easily protect yourself against loss by remembering these points about

Prest-O-Lite
and Prest-O-Lite Service

Your genuine Prest-O-Lite Tank is in universal use and demand—therefore it can be exchanged when empty for a full one, ANYWHERE and ALWAYS. Imitations cannot.

Any tank that has a poor exchange service now—soon may have none at all.

Dozens of imitators of Prest-O-Lite have gone out of business, leaving users and dealers with tanks that could neither be sold nor refilled. The moral is obvious.

Protect yourself by looking for our label on exchange tanks. We can not be responsible for poor quality and short measure of gas in tanks not filled by us.

A TIP TO DEALERS

The majority of wise dealers handle Prest-O-Lite. They know it's the only safe proposition. Some few have yielded to the tempting claim, "more profit." The majority of these have been left with tanks that could neither be sold nor refilled. The few dealers who still trifle with imitations are finding it harder each day to sell them.

Remember that Prest-O-Lite has always been, and is now more than ever before, a source of good steady profit to you.

The Prest-O-Lite Co. 287 E. South Street Indianapolis, Indiana

Branch offices and Service Stations in all principal cities. Charging Plants in all parts of the country. Extensive foreign service.

Ever Have a Blow Out?

Of course you have. Then you know just what a blow out means to your customers—especially a blow out which comes when your tire has gone probably less than half the distance it should go. What is it worth to you to protect your customers against these blow outs?

Gilmer Tire Repair Pliers

PREVENT BLOW OUTS

They do this by enabling the car operator to repair properly the small cut and prevent them from becoming big cuts and blow outs. It requires but little time and scarcely any effort for your customer to double his tire mileage by using GILMER TIRE REPAIR PLIERS.

The need of Gilmer Tire Repair Pliers is so urgent that a simple showing of them to your customers means many sales.

Get your order in early so that you won't be disappointed later.

¶ In the Overland Model 69T we offer the representative car; the product typical of the times. It has been and is the constant aim of each individual automobile manufacturer to give the very greatest value for the very least money. The Willys-Overland Company, in its 1913 product, has done just that. This car is the most this or any other concern can offer at anything like the price. A comparison with other cars, costing $1200 drives this fact home. It is only our factory organization and equipment, systematized and complete to the last detail, and capable of an annual production of 40,000 cars, which makes this possible.

Our catalogue will tell you all about it; write today. Please address Dept. 50.

The Willys-Overland Company, Toledo, Ohio

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, October 24, 1912 No. 5

WILLYS ADDS $10,000,000 BUT REPUDIATES MERGER

Capital Increased to $25,000,000 and Stock to be Offered to Public—Willys, However, Will Remain in Full Control.

It became known late last week that the Willys-Overland Co. was about to increase its capital from $15,000,000 to $25,000,000, which fact promptly caused the circulation of highly colored reports that John N. Willys was on the point of effecting a merger of more or less far-reaching scope.

As on several previous occasions his remarkable growth during the last three years had given rise to stories that he had a gigantic merger in view, the reports found more or less credence, particularly as in Chicago financial circles it was openly stated that unnamed Detroit interests were involved in the combination.

When he was reached, however, Willys himself promptly punctured the bubble which had been blown for him. Others near to him had been non-committal or evasive, but he was in New York yesterday and, when interviewed by a Motor World man, he did not attempt to deny that the capital of the Willys-Overland Co. would be increased to $25,000,000, as stated. He did deny, however, that he had the remotest idea of effecting a combination with anyone, or that any changes of material moment in the several properties which he owns are in view.

The increased capital, $10,000,000, is represented wholly by common stock, of which $5,000,000 has been sold to the New York banking house of William Salomon & Co., who also have acquired $2,900,000 of preferred shares and $5,000,000 of the common. Willys himself retains $10,250,000 of common stock and a large block of the preferred, and he will remain in full control.

Arrangements practically have been completed for the listing of the Willys-Overland stock on the New York Stock Exchange, which means that a block of it shortly will be offered for public subscription.

The refinancing plan applies to the Overland, Garford, Gramm and Kinsey companies, in Ohio; the Federal Motor Co., in Indianapolis, and Morrow Mfg. Co., in Elmira, N. Y., all of whose stock is held by the Willys-Overland Co.

In August last the Willys-Overland capital was increased from $6,000,000 to $15,000,000, of which $5,000,000 was preferred stock, the new capital being employed further to expand the already remarkably large properties which Willys has amassed and built up in a manner and in such a short space of time as to make the world take notice of him.

Ward Adds Strength to King Company.

Artemus Ward, the New Yorker who purchased the assets of the King Motor Car Co., of Detroit, in which he previously was interested, has reorganized its internal affairs to such good advantage that the company is now on a sound financial basis and its 1913 models ready for delivery.

Two of the new men whom Ward has brought into the organization are J. G. Bayerline, who has been appointed manager, and T. A. Bollinger, who has been made factory manager. Both formerly were identified with the Warren Motor Car Co., of which Bayerline was general manager for three years. He also had experience with the Pope, Oldsmobile and Hudson companies. The car will continue to bear the name King and the reorganized company will protect King owners on the guarantees issued by the old concern.

To Make Rutenbers Across the Border.

The Rutenber Motor Co., of Marion and Logansport, Ind., has acquired a plant in Chatham, Ont., where Rutenber engines will be manufactured for the Canadian trade. G. W. Bowen, the new president of the Rutenber company, will be its head.

OPPOSITION TO U. S. MOTOR REORGANIZATION DEVELOPS

Minority Stockholders Object to $24 Assessment—But Plan Progresses and Flanders Enters Into the Transactions.

Opposition has developed to the proposed plan of reorganization of the United States Motor Co., but when the Federal court on Monday next, 28th inst., is asked to approve the plan the opposition is unlikely to prevail before the ponderous bulk of the stockholders and creditors who are prepared to acquiesce in the proceedings and help the big but embarrassed corporation to regain a sound financial footing.

On the day in court, which is the time the receivers are due to render a report, the minority stockholders are expected to enter a protest against the proposal that shares be assessed $24 each, their position being that such funds should be made available through a bond issue instead of an assessment. Several courses are open to them in an attempt to delay proceedings, the most probable being that they will ask an adjournment for the purpose of examining the receivers' report.

Meanwhile the reins of the United States Motor Co. have been taken from the hands of Benjamin Briscoe, as president, and the reorganizers for several weeks have been seeking far and wide for a man to manage the reorganized corporation. The office of general manager had been tendered to George W. Bennett, of the Willys-Overland Co., and several other well-known men in the trade, all of whom refused it. In due course, Walter E. Flanders, president of the Flanders Motor Co., and the best press-agented man in the industry, came to the notice of the reorganizers and at last accounts he was not only due to become general manager of the United States Motor Co. but was to take with him into the

Digitized by Google

organization his own Flanders Motor Co.

This turn of affairs will provoke smiles on the part of all those who are familiar with inside conditions and if the negotiations are consummated, as appears likely, it will cause some of those concerned to release long pent up sighs of relief.

Under the reorganization plan the Central Trust Co. of New York, 54 Wall street, has been made the depositary for all debenture bonds, bond scrip certificates, notes and creditors' claims of those who wish to enter into the reorganization plan. At the time of deposit 10 per cent—$2.40—of the $24 assessment must be paid.

A syndicate headed by Hallgarten & Co., bankers at 5 Nassau street, has agreed to underwrite the new stock and will purchase for $5,720,996 the voting trust certificates representing the stock allotted to assenting stockholders in both the Motor and Columbia companies. The syndicate's commissions, it is said, will be in the neighborhood of $1,500,000.

The new stock, although yet unissued, is figuring on the New York curb in Broad street, where the traders of "blue sky" tendencies have been trading in the new paper "when, as and if issued." Saturday last the prices were 1st preferred 75, 2nd 40 and common 10, but when the rumors of a minority protest began to permeate the "street" these prices fell, and on Tuesday of this week were first preferred 68 to 72, 2nd 35 to 38 and common 9½ to 10.

Denies Alco Sale is Contemplated.

During the past week rumor has been free with the affairs of the American Locomotive Co., the general trend of the rumors being to the effect that the big corporation was about to divorce its locomotive and automobile interests and that the latter would be disposed of to unnamed parties represented by J. W. DuB. Gould and S. G. Averill. The latter is said to be related to the Harriman family and Gould to the Harvey Fisk family, which made it appear that enormously wealthy interests were involved in the alleged transaction.

It transpires, however, that Gould and Averill are efficiency engineers and that they have been engaged in fine-combing the Alco establishment, with a view of placing it on a better basis, and for that purpose several times have visited the factory in Providence and the offices in New York City, which visits apparently gave rise to the report.

W. H. Marshall, president of the Locomotive company, declared to a Motor World man that there is absolutely no basis for the rumors, and that the company had no intention of disposing of its automobile interests or any of its stock holdings; nor are official changes contemplated.

BARLOW'S CHARGES FAIL BUT RECEIVERSHIP FOLLOWS

Court Dismisses His Suit But Chicago Creditor Then Acts Against Streator Company—Result of Internal Turmoil.

Efforts of John C. Barlow practically to tie up the Streator Motor Car Co., of Streator, Ill., of which he is president, and to force a change of management have failed. The several suits which he brought against the company, and all of those who had to do with its reorganization, were dismissed on Monday last by Judge Eldredge in the Circuit Court of La Salle County (Ill.), after a trial which lasted some three weeks. The court ruled that the Barlow action lacked equity and dissolved a temporary injunction which had been issued without notice to the Streator company and its co-defendants.

The Streator company's victory, however, proved to be of small avail, as yesterday it was thrown into the hands of a receiver on the petition of the Tuthill Spring Co., of Chicago.

At the time of its embarrassment last year, the reorganization of the company was effected by the pledging by Barlow and Paul L. Chubbuck, vice-president of the company, of most of their possessions, a bondholders' committee being formed to observe the conditions. Barlow and Chubbuck then were firm friends, but for some reason or other Barlow took offense and instituted proceedings in which he charged mismanagement of the business and a conspiracy to defraud him. He named as defendants the Streator Motor Car Co., the People's Trust & Savings Co., Western Motor Co. of Indiana, A. O. Smith Co. of Milwaukee, Frank B. Wilkinson and W. J. Zimmers.

The burden of Barlow's complaint was that the management of the company was being shaped for the benefit of Chubbuck and the bondholders' committee. To carry out his program, he also sought the appointment of a temporary receiver for the company until his complaint could be heard by the court. All of the defendants apparently were sure of their ground, for they immediately waived service of process, entered their appearance and asked for an immediate hearing.

When the case came to trial Barlow took about three weeks to put in his testimony. Much to his surprise, the defendants, feeling that Barlow had not made out a case, refused to offer evidence of any sort. The case, therefore, was decided by the court on the testimony of the plaintiff alone, which, as stated was sufficient to convince the court that it was without merit.

Daimler Import Finally Goes Under.

Pressure on the Daimler Import Co., of New York, which during recent weeks had become acute, resulted in its failure on Monday last, 21st inst., when H. Content & Co. threw it into the bankruptcy court. The Content claim, which covers rental of the Daimler premises at 751 Fifth avenue, amounts to $1,826.18. Previously three other judgments had been entered against the Daimler company, two of them representing notes for $23,270, held by the New Netherlands Bank of New York, the others representing unpaid insurance premiums and money paid by J. A. G. Pennington, of Norfolk, Va., for a truck which was not delivered. It is also understood that the Import company owes the parent Daimler company some $15,000 in license fees.

The company was incorporated in 1910 with capital stock of $300,000 and, under license, held the selling rights for Mercedes cars. J. M. Carples, its secretary and manager, tendered his resignation some three weeks since, and it is generally understood that he will become interested in the Mercedes-Daimler Selling Corporation, which recently was incorporated under New York laws and which probably will fall heir to the Mercedes selling rights.

Lacair Seeks $15,000 for Broken Contract.

Alleging that he had been damaged $15,000 worth by the cancellation of his contract, Robert J. Lacair on Thursday last instituted an action in the Supreme Court in New York County and secured a writ of attachment for that amount against the Jackson Motor Co., of New York City, by whom he had been engaged as sales manager on July 1st last.

In support of his allegations, Lacair submits the letter written by L. P. Hutcheson, the vice-president, in which it is set forth that Lacair was to receive a salary of $3,600 per year and was to dispose of 25 cars by October 1st last, failing which the Jackson company reserved the right to terminate the contract. In addition to his salary, Lacair was to receive a commission of $10 on every car sold and delivered, and if he disposed of 400 cars by February 1st, 1913, his salary was to be increased to $5,000 a year, plus the $10 commission.

Lacair claims that he contracted not only for 25 cars by October 1st but for a total of 190 cars, and assumed that everything was satisfactory until October 2nd, when he received a letter informing him that his contract had been terminated. He then lost no time in consulting an attorney and filing suit.

AJAX-GRIEB'S NEW POLICY NETS INCREASED EARNINGS

End of First Year's Appeal to Dealers Shows Profits of $408,000—More Than 3,000 New Accounts Opened.

Prosperity smiled broadly on the Ajax-Grieb Rubber Co. during the past season—how broadly is witnessed by the fact that on a net business amounting to $2,936,-923.19, during the fiscal year ending August 31st last, there were net earnings of $408,-434.53, which is practically a two-fold increase as compared with the net earnings of the previous year. The financial statement of the company for its fiscal year, which just has been made public, is as follows:

Assets.

Cash in banks and offices		$110,307.48
Bills receivable		137,389.42
Accounts receivable		291,313.65
Merchandise and materials		432,672.81
Mortgages, etc. (owned)		12,912.61
Real estate, buildings, machinery and equipments	$322,296.72	
Less depreciation charges	57,844.01	
		264,452.71
Patents		10,000.00
Total assets		$1,259,048.68

Net earnings for year, $408,434.53.
Fire insurance carried, $890,000.00.

Liabilities.

Notes payable		None
Accounts payable (not due)		$155,161.77
Capital stock:		
Preferred 7 per cent.	$285,000.00	
Common	450,000.00	
		735,000.00
Surplus August 31st, 1912		368,886.91
Total liabilities		$1,259,048.68

In his report submitting this financial statement, William G. Grieb, president of the Ajax-Grieb Rubber Co., remarks that, although the factory in Trenton has been working 24 hours a day since February, 1911, and still is working at full pressure, it has not yet been able to meet the demand for either Ajax tires or the druggist sundries which are produced, and has in hand orders sufficient to keep the plant at top speed for two months.

Accounting for the handsome increase in earnings, President Grieb points out that it was considerably influenced by the fact that "price units obtained were about 25 per cent. less than the preceding period," due to the policy of the company in reducing the volume of business done with automobile manufacturers and increasing the business with dealers and car owners which, of course, correspondingly increased the margin of profit, and at the same time reduced the possibility of loss. This policy also resulted in increasing the number of Ajax customers by more than 3,000, giving to the Ajax productions a much wider distribution.

Cannon Secures Support in Iowa.

J. F. Cannon, who, it is stated, has been connected "with nearly all of the leading automobile factories in Detroit and elsewhere," has organized the Cannon Motor Car Co., in Des Moines, Ia., and opened temporary offices in the Utica building in that city. Two factory sites are in view, but no selection will be made until the company, which will be backed partly by Des Moines capital, is incorporated. It is Cannon's purpose to produce a light roadster and a light truck, each of which will list at about $500. It is stated that success already is assured, as the entire output of the projected factory for the first year has been contracted for by a dealer in Des Moines.

Stewart Carburetter Going into Germany.

Indicating that the foreign sponsors for the Stewart carburetter, the California invention which already has obtained a foothold in Great Britain, are reaching out for business on the Continent, the Stewart Precision Carburetter Co. (Germany), Ltd., has been registered under English laws with an authorized capital of £10,000. G. B. Ellis, 70-72 Chancery lane, London, figures as the corporator.

Buys Three Years' Output of Rayfields.

The Rayfield Motor Sales Agency, of St. Louis, Mo., has contracted for the entire output of the Rayfield Motor Co. of Chrisman, Ill., for a period of three years, the production being six-cylinder cars exclusively. The Rayfield Motor Sales Agency is an outgrowth of the Brown Automobile Co., of St. Louis, and is controlled entirely by J. R. Brown and his associates.

Clevelanders Purchase Elmore Parts.

The M. & M. Co., of Cleveland, O., which is one of the prominent supply houses in that part of the country, has purchased the entire stock of parts of the Elmore two-cycle car, the manufacture of which recently was discontinued by the General Motors Co. The stock purchased includes not only parts but bodies.

Federal Rubber Doubles Its Capital.

The Federal Rubber Mfg. Co., of Milwaukee, which is one of the John N. Willys properties, has increased its capitalization from $1,000,000 to $2,000,000. The increase is represented by 7 per cent. preferred stock redeemable at 120, and is designed to take care of the expansion of the plant which already is in progress.

BRISCOE TO RELINQUISH U. S. MOTOR PRESIDENCY

"Crucified," Say Friends, Despite Announcement Couched in Graceful Terms—How Ticker Tape Cost Him Dear.

After a year of that sort of experience that turns hair gray, Benjamin Briscoe has resigned the presidency of the United States Motor Co., which now is in process of reorganization. He will remain in office, however, until about November 15th, when, with his family, he will leave for several months' stay in Europe for the recuperation which he so greatly requires.

Announcement of Briscoe's resignation was made late last week. It was couched in graceful, flowing language, which, however, did not deceive those who are familiar with existing conditions. It was well known that he would retire and that everything was working to that end. In fact, as long ago as July last, and two months before a receiver was appointed, financial prints had stated that he would relinquish his high office in the big corporation. It was an open secret that since the banking interests projected themselves actively into the affairs of the United States Motor Co., Briscoe's way had not been strewn with roses. They gradually assumed entire control and latterly even took possession of Briscoe's private office, shunting him to small quarters in an out-of-the-way corner in the building at West 61st street occupied by the company.

However Briscoe may feel, there is no doubting the sentiments of his intimates. "Ben has been crucified," is the way one of them expressed it after his resignation had been announced, the man who voiced this opinion declaring that Briscoe himself is one of God's noblemen to whom he willingly would give anything save his wife.

It is generally understood that Briscoe will be succeeded by W. E. Strong, who became chairman of the company's board of directors when its financial stringency became acute and who was appointed one of its receivers when the failure occurred on September 11th last. Strong represents the banking interests and will have general oversight and direction of the company's financial affairs, the general management of which will fall on other shoulders. It has been offered to several well known men in the trade but, so far as known, only Walter E. Flanders consented to consider it.

Briscoe's experience in the United States Motor Co. cost him a pretty penny. He first entered the automobile trade through the medium of the Briscoe Mfg. Co., of

Digitized by Google

Detroit, which began the manufacture of automobile parts in 1899. Later, in 1904, he joined with J. D. Maxwell in organizing the Maxwell-Briscoe Motor Co., which, founded on the ruins of the Mobile Co. of America, attained remarkable success. It was on the top wave of prosperity when the Selden patent, which Maxwell-Briscoe had refused to recognize, was declared valid in 19—. a decision which later was reversed but which caused a semi-panic and a rush for cover on the part of unlicensed manufacturers. In order to obtain a Selden license, Briscoe and his associates acquired the Columbia Motor Car Co., of Hartford, which not only held a license but which was a participant in the royalties accruing from the patent.

The United States Motor Co. grew out of this combination, which, during the first year earned a profit of $2,600,000. It was through the acquirement of the Columbia company that several men of millions and ticker tape entered into the affairs of the big corporation. In due course, they attracted others of their kind and the business was enlarged by the acquirement of the Dayton Motor Car Co., of Dayton, O.—against Briscoe's judgment, it is stated—for which the sum of $4,000,000 was paid, and also by the purchase of the Alden Sampson Mfg. Co., of Pittsfield, Mass., for which a comparatively nominal sum—less than $200,000—was given.

During the last year the E. R. Thomas Motor Co., of Buffalo, N. Y., which had been purchased by one of the bankers who had become one of the largest holders of United States Motor debentures, was quietly unloaded on the United States Motor Co., although its condition at all times during recent years was questionable. Meanwhile, factory enlargements had been the rule, and although the big company was doing a good business, it lacked working funds, and with burdens which had been imposed, it gradually bent and finally reached the breaking point on September 11th last.

Some of those who are familiar with the conditions which existed do not hesitate to employ strong language in describing the means and motives which brought about this end. It is certain, at any rate, that the big corporation became enmeshed in ticker tape, with which Briscoe, at least, was not very familiar, and that things were done which men who had no interest in tickers or ticker tape would not have done if left to themselves.

The assessment of $24 per share which has been levied on the United States Motor Co.'s stock will, it is said, assist in serving the ends of men who watch the tickers. Some of them are reported to have bought large blocks of the stock since the failure at less than $1 per share, and as an underwriting syndicate stands ready to provide the necessary capital for the reorganization, their gains will be large. All of those unable to meet the assessment, of course, will be wiped out. In the case of Messrs. Maxwell and Briscoe, for instance, it is understood that their holdings are so large that to meet the assessment would require cash otulays of approximately $400,000 each, a sum sufficient to cripple the resources of even men who occupy high places but who have put most of their fortunes into brick and machinery.

Williams Heads Electric Association.

At the annual meeting of the Electric Vehicle Association of America, Arthur Williams, of the New York Edison Co., was chosen president, to succeed William H. Blood, Jr., of Boston. The other officers elected are as follows: F. W. Smith, United Light & Power Co., New York, vice-president; Harvey Robinson, New York, secretary, and Day Baker, Boston, treasurer. The following named were elected members of the executive board: William H. Blood, Jr. (Stone & Webster, Boston), P. D. Wagoner (General Vehicle Co., New York), G. N. Kelly, New York, and E. S. Mansfield (Boston Edison Co.) for three years; William G. Bee, Edison Storage Battery Co., Orange, N. J., to fill an unexpired term of one year.

Wishart-Dayton Files its Schedule.

The Wishart-Dayton Auto Truck Co., which was petitioned into bankruptcy about two months ago, this week filed its schedule in bankruptcy in the Federal court in New York City. They disclose liabilities of $33,899 and nominal assets of $13.569, consisting of one motor truck, $2,493; accounts of $1,076, and a claim for $10,000 damages against the Dayton Auto Truck Co., of Dayton, O., for which the alleged bankrupt was New York dealer. Among the creditors are the Dayton Auto Truck Co., $4,729; Knauth, Nachod & Kuhne, $17,532, secured; People's Bank and Trust Co. of New Haven, Conn., $3,530, and E. W. Clave & Son, Inc., $2,280.

Hayes Note Indorser Claims Immunity.

Just who should pay two notes of $572.41 given July 18, 1910, to George M. Port, a rubber middleman, of 155 Sixth avenue, New York City, by the Hayes Rubber Co., of New York City, which several months since became financially involved, is the problem contained in a suit now in the Supreme Court for New York county, wherein the Ross Rubber Mfg. Co., a Wisconsin incorporation, is the complainant in the case.

According to the pleadings, the notes were given to Port by the Hayes company and Port endorsed them and passed them on to the Ross concern. The notes were due April 1 and June 1, 1911, and on the latter note $500 was paid at divers times between June 28 and October 14. The complainant asks the face of the notes and interest less the $500. Port, however, claims that following the maturity of the April 1st note he asked for a statement of his account with the Ross company and paid it, the amount being $26.77, and the note not being included. He, therefore, claims immunity from prosecution.

Canada Chief Purchaser of Engines.

Of the 613 automobile engines which constituted the American exports for the month of August, more than two-thirds, or, to be exact, 493, were shipped into Canada from Detroit, the record in detail being as follows:

	Number.	Value.
Canada	493	$45,197
England	116	35,514
Cuba	3	471
Venezuela	1	230
	613	$81,412

For the eight months ending with August, the total exportation of engines reached a valuation of $724,135, which represents 6,316 separate motors. As the records were not separately kept at that time, comparison with the corresponding period of previous years is impossible.

Green Wins in Broken Contract Suit.

The claim of A. Hazen Green, an accessory dealer at 1686 Broadway, New York City, that his selling contract of some four years ago with the Niagara Lead & Battery Co., of Niagara Falls, N. Y., was broken and that he was damaged, resulted last week in a verdict in the Supreme Court for New York County of $5,118.55 for Green. His claim was for damages to the amount of $10,000.

U. S. Motor Sells Another Branch.

The United Motor San Francisco Co., which is substantially the Pacific Coast branch of the United States Motor Co., has been taken over by Fred J. Linz and L. W. Sanborn, both of whom have been identified with Maxwell cars since 1905. Their territory includes Northern California, Nevada and Hawaii.

Farr Opens His Office in Detroit.

Henry W. Farr, at one time connected with the General Motors Co., has set up as manufacturers' representative in the Wayne County Bank building, Detroit. Among his several accounts are those of the Brown Windsheld Co., Instantaneous Lighter Co and the Duplex Electric Mfg. Co.

KNOX ELECTION DOES NOT SIGNIFY REORGANIZATION

Merely a Legal Formality and Officers Chosen Not Permanent—One Reorganization Plan Formulated But Lacks Approval.

Because the Knox Automobile Co., of Springfield, Mass., elected officers last week, there were those who assumed that it marked a step in the reorganization of the company, if, indeed, it did not mark its practical completion. As a matter of fact, however, the election of officers had no bearing on the reorganization plans which are in hand; it was merely a formality made necessary to keep the Knox organization alive, the election occurring on the date fixed for its annual meeting.

So far as the stockholders of the company are concerned, they own none of the assets, all of which, of whatever nature, were transferred to Harry G. Fisk and Edward O. Sutton, to whom the company assigned on September 28th. Messrs. Fisk and Sutton are sons-in-law of the late A. N. Mayo, who was by far the largest creditor of the Knox company; and, according to reports, the action of the Mayo administrators will have an important bearing on any reorganization plan which may be submitted. Certain stockholders are particularly active in that direction and have gone so far as to form a creditors' committee to outline a plan of organization.

The committee of three which is drafting the plan comprises Thomas Z. Lee, of Providence, R. I., chairman; John J. Shaughnessy, of the First National Bank of Marlboro. Mass., and C. C. Lewis, of Springfield, Mass. Judge Lee will not disclose the full extent of the plans which will be submitted, but states that his committee has entered into negotiations with the Old Colony Trust Co. of Boston to act as depository of all the claims of the creditors, both secured and unsecured, and also the common and preferred stock of the company. When these deposits have been made, the complete plan for the readjustment will be forwarded to all the creditors for acceptance.

Although Judge Lee has stated that entire harmony prevails on all sides, he nevertheless has let fall some caustic criticisms of the former management of the company, adding that economies effected since the assignment have served to put the property on a paying basis. Despite Judge Lee's assertion that harmony exists, it is stated that the Mayo interests may not be found agreeable to the plan of reorganization which his committee proposes to submit.

A condensed statement of the Knox company's condition, which was presented at the annual meeting on October 1th, is as follows:

Fixed Assets.	
Real estate	$307,212.62
Machinery and equipment	241,622.22
Agency equipment	2,975.44
	$551,810.28
Floating Assets.	
Inventories	$1,264,116.06
Prepaid insurance and interest	8,647.52
Notes receivable	6,892.77
Accounts receivable	300,163.02
Cash	14,272.44
	$2,145,902.09
Less reserve for doubtful accounts receivable	30,000.00
Total assets	$2,115,902.09
Fixed Liabilities.	
Mortgages payable	$36,900.00
Floating Liabilities.	
Notes payable	$978,500.00
Accounts payable	199,832.68
Advanced on orders	8,562.53
Accrued interest, payroll and taxes	28,566.19
Total liabilities	$1,252,361.40
Capital stock	$1,000,000.00
Less deficit of	136,459.31
Net capital	$863,540.69

The officers who were elected at the annual meeting, which action, as stated, is merely in the nature of observing a legal formality, are as follows: President, W. E Wright; vice-president, H. G. Fisk; treasurer, A. E. Smith; clerk, Charles H. Beckwith. The directors are H. G. Fisk, E. O. Sutton, W. H. Chase of Leominster, M. J. Greenwood of Gardner, Elijah C. Johnson of Hartford, Conn., Peter Murray, W. H. Cutler of North Wilbraham, W. E. Wright and C. H. Beckwith. The executive committee of the board of directors will be composed of Peter Murray, W. E. Wright and E. O. Sutton.

Souther Sails on Wire Wheel Mission.

Henry Souther, former president of the Society of Automobile Engineers, sailed to England, on Saturday last, in the interests of the George W. Houk Co., of Philadelphia, which recently acquired the American rights for the manufacture of the Rudge-Whitworth factory in Coventry, with a view of familiarizing himself with the processes in vogue there, having particularly in mind the quick detachable rim which has been developed for application to wire wheels.

Packard Secures Foothold in Germany.

R. Dreyman, of Dusseldorf, has secured the Packard agency for the German empire. It is his purpose to push the American car aggressively, and to that end he will establish several branches for the distribution and care of Packard cars.

PREST-O-LITE INSTITUTES FIVE SUITS ON NEW LINES

All Who Refill Its Trademarked Tanks To Be Prosecuted in Broad Campaign—New York Business Law Invoked.

Suits which in their scope may be far-reaching enough to hit every automobile dealer and garageman in New York State who fails to respect the Prest-O-Lite patents in their entirety have been instituted by the Prest-O-Lite Co., through its New York attorneys, the first actions having been filed in several districts of the New York Municipal Court. The proceedings are brought under section 367 of article 24 of the general business law of New York State, and if convictions result each defendant will be compelled to pay $100 for every time he has refilled any of the gas tanks manufactured by the Prest-O-Lite company.

The first suits are leveled at the Weaver-Ebling Auto Co., 35% Automobile Supply Co., American Auto Supply Co. and J. H. Parsons, of New York City, and Banzer & Schluchtner, Brooklyn. These are apart from actions carried on in the Federal courts for patent infringement and are brought under that section of the State law which forbids a corporation or individual to refill any receptacle which originally contained a patented article and which receptacle is trade-marked.

There also is pending in the Supreme Court for Erie County, in Buffalo, a similar action against the Searchlight Gas Tank Co., wherein the Prest-O-Lite Co. asks approximately $50,000 as penalties for the refilling of tanks. The Searchlight company was sued for infringement in the Federal court and won out before Judge Kohlsaat in Chicago, and that case is now in the Circuit Court of Appeals.

Ohio's Assets Appraised at $239,000.

Appraisers appointed by the receivers of the Ohio Motor Car Co., of Cincinnati, O., have rendered their report, placing the value of the company as a going concern and as an entirety at $239,000. The total was made up of these several items: Real estate, buildings and sprinklers, $80,000; electric light and wiring, heat and power system, $3,000; machine tools, patterns, dies, machinery (not machine tools), $22,-145; fixtures, shafting, beltings, vises, anvils, $3,343; office fixtures, safes, filing cabinets, $1,700; power plants, motors, $5,000; stock and material, finished and unfinished, $81,640; bills receivable and bank accounts, $10,631.44; cash on hand, $15,053.30.

GENERAL MOTORS' SALES IN EXCESS OF $64,000,000

Net Profits Nearly $700,000 More Than Last Year—Annual Statement Discloses Condition of Big Corporation.

According to its financial statement for the fiscal year ending on July 31st last, which just has been issued, the 24 companies constituting the General Motors organization did a business of $64,744,496, which compares with $42,733,303 during 10 months of the previous year, the loss of two months being explained by a change in the date of the company's fiscal period.

The total profit from the operation of the subsidiary companies amounted to $5,770,-177, from which has been deducted $1,023,-421 for losses in certain of the subsidiaries, leaving a net profit to the General Motors Co., after deductions for depreciation, of $4,746,756, as against $4,066,251 for the 10-months period of 1911. The surplus has been increased from $1,240,175 to $1,262,-594, and the reserves from $3,202,076 to $4,299,471. The profit and loss account for the 12 months is as follows:

PROFIT AND LOSS ACCOUNT

Profit and Loss surplus July 31, 1911	$1,240,175.26
Add undivided profits for 12 months ending July 31, 1912, per income account above	2,856,082.76
	$4,096,258.02
Reduction of inventory and assets as carried on books October1, 1910, and liquidation losses	2,833,663.14
Profit and Loss surplus July 31, 1912	$1,262,594.88

The total assets of the company are $54,-388,072. The liabilities are $53,695,563.72; they include Weston-Mott notes amounting to $600,000, of which $300,000 was paid on September 15th last. The remaining $300,-000 does not mature until one year later. The General Motors Co. previously owned all save 50.2 per cent. of the Weston-Mott capital stock, entire control, it transpires, being secured on payment of $1,040,000, equally divided in preferred and common stock. The increase in the company's good will is explained by the Weston-Mott purchase.

The current assets have been reduced from $26,186,816 to $25,311,135, but by the same token the liabilities have even more greatly diminished, from $23,401,201 to $20,-928,259, the net working capital being $20,-666,865 as against $23,065,353. During the year there was charged to capital account the sum of $1,648,206, representing additions to real estate, plants and equipment, amounting to $2,124,184, from which were deducted sundry adjustments, which are charged off to profit and loss, amounting to $475,978. About half of this expenditure represents additions to the Cadillac plant and equipment, which will permit increasing the output from 12,000 to 15,000 a year.

During the fiscal year the exports amounted to approximately $1,700,000 exclusive of the Canadian trade, the figure being about double that for 1911.

In rendering his report, Thomas Neal, president of the General Motors Co., states that manufacturing operations are more advanced than during either of the two preceding years, and that the cash receipts for the first two months of the new fiscal year were more than $1,000,000 ahead of the corresponding period of last year.

The statement in detail and how it compares with the preceding year is shown in the following table:

Cleveland-Galion to Increase Capital.

Stockholders in the Cleveland-Galion Motor Truck Co. have been called to meet in the offices of the company in Cleveland, O., November 4, to vote upon a proposition to increase the company's capital stock from $300,000 to $1,000,000. The new stock is to be $500,000 7 per cent. cumulative preferred and $200,000 common.

Star Carburetter Enlarges its Scope.

Its productions having become considerably diversified, the Star Carburetter Co., of Detroit, Mich., has changed its name to the Star Foundry & Machine Co. It will continue to operate, however, at 685 East Atwater street.

CONDENSED CONSOLIDATED BALANCE SHEET

The Week's Incorporations

Des Moines, Ia.—Guarantee Motors Co., under Iowa laws, with $3,000 capital; to deal in motor cars. Corporators—John A. Garver, C. T. Gadd, and others.

Jersey City, N. J.—Delton Tire Co., under New Jersey laws, with $500,000 capital; to manufacture tires. Corporators—H. O. Coughlan, T. K. Mallaby, H. T. Letts.

Kansas City, Mo.—Shackelford Garage Co., under Missouri laws, with $2,000 capital; to operate a garage. Corporators—Addison Shackelford, L. E. Shock, Paul Gee.

Clarkedale, Tenn.—Essenkay Sales Co., under Tennessee laws, with $4,000 capital; to deal in tire filler. Corporators—J. L. Hartshorn, J. W. Primrose, L. L. Lebdetter.

Oak Park, Ill.—Radway Garage Co., under Illinois laws, with $6,000 capital; to operate a garage. Corporators—James F. Bambas, Henry P. Sinden, Charles J. Radway.

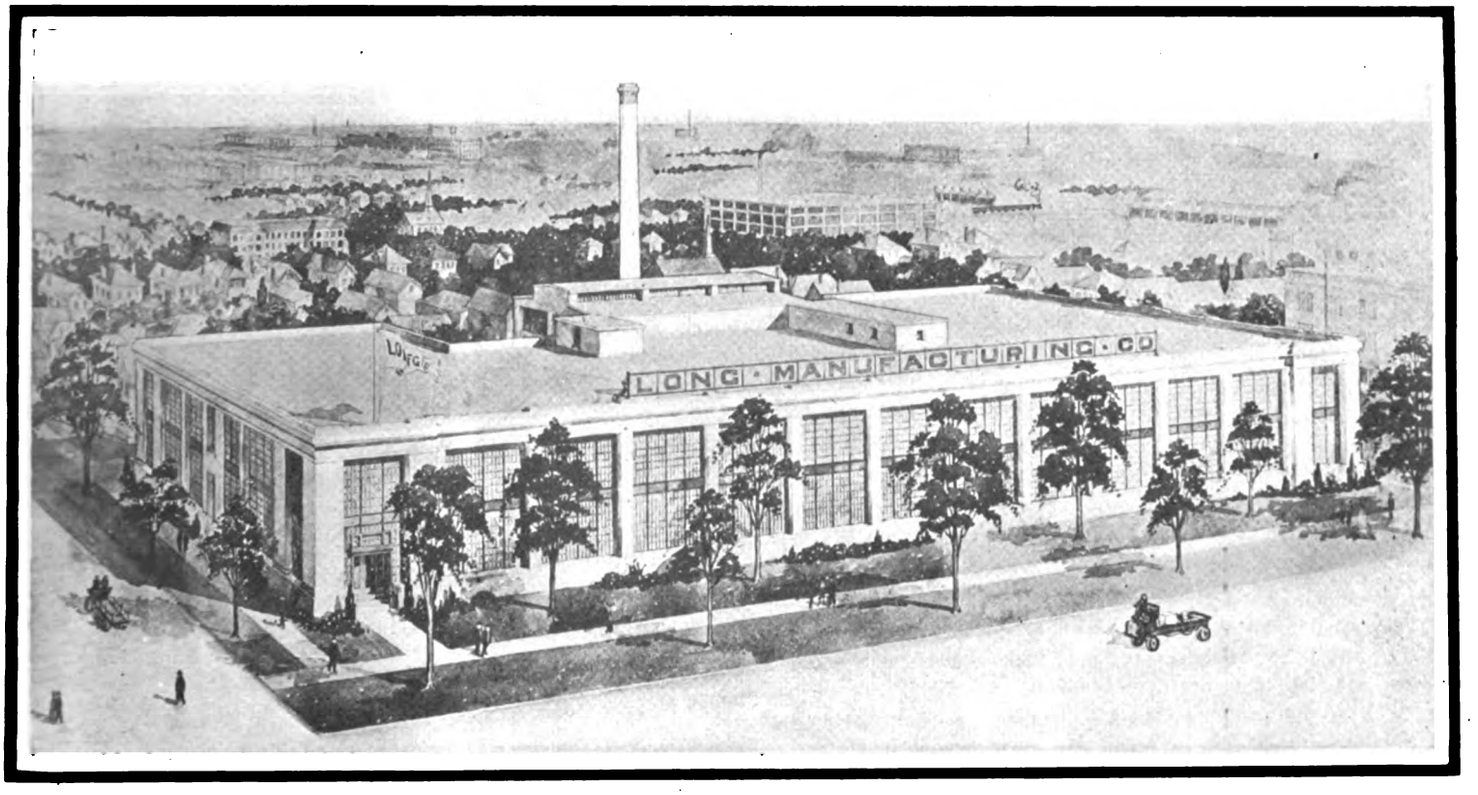
Rock Hill, S. C.—McFadden Automobile Co., under South Carolina laws, with $3,500 capital; to deal in motor cars. Corporators—J. Leonard Yates, B. S. Dearing, N. B. Yost.

Wabash, Ind.—Sterling Absorber Co., under Indiana laws, with $3,000 capital; to manufacture motor car parts. Corporators—Marshall Tillman, Charles Huff, Joseph Kaiser.

Louisville, Ky.—Macpherson Automobile Co., under Kentucky laws, with $1,000 capital; to deal in motor cars. Corporators—F. Macpherson, O. Macpherson, C. Macpherson.

Louisville, Ky.—Dixie Rubber Co., under Kentucky laws, with $5,000 capital; to deal in tires, etc. Corporators—Albert H. Drake, Jack F. Marx, Ray C. Ellis, Arthur M. Breckler.

Newark, N. J.—Liberty Oil & Supply Co., under New Jersey laws, with $25,000 capital; to deal in lubricants. Corporators—Fred L. Foster, Rose C. Higgins, Irving Kunsman.



Belleville, Mo.—St. Louis Motor Transportation Co., under Missouri laws, with $25,000 capital; to operate a motor delivery. Corporators—William Bush, Frank Bush, and others.

Detroit, Mich.—Merralls Starter Co., under Michigan laws, with $15,000 capital; to manufacture engnie starters. Corporators—Wm. A. Merralls, Robert S. Neely, Harlow B. Cowland.

Nashville, Tenn.—Jackson Motor Car Co., under Tennessee laws, with $5,000 capital; to deal in motor cars. Corporators—H. C. Gillespie, D. D. Canfield, W. H. Weakley, W. D. Sandefeur.

St. Louis, Mo.—Auto Products Co. of America, under Missouri laws, with $25,000 capital; to deal in motor car parts. Corporators—Warren W. Smoot, Eugene B. Stinde, A. E. Smoot.

NEWLY COMPLETED PLANT OF LONG MFG. CO., IN DETROIT, MICH.

The new building, which is 270 x 120 feet, is constructed of reinforced concrete with cement floors and every facility to obviate the danger of fire. It fronts on East Grand Boulevard, between Cameron and Richmond streets, and will permit the production of automobile and tractor radiators to be trebled.

Newark, N. J.—Tri-Unit Electrical Co., under New Jersey laws, with $100,000 capital; to manufacture electrical devices. Corporators—J. B. Stobaeus, Jr., B. W. Matthews, W. C. Stobaeus.

Dayton, Ohio.—McVey Manufacturing Co., under Ohio laws, with $60,000 capital; to manufacture car appliances. Corporators—James L. McVey, Walter C. Fraine, Amos H. Burkhart, Millie Galloway, Richard J. McCarty.

Detroit, Mich.—Universal Auto Supply and Repair Co., under Michigan laws, with $2,000 capital; to deal in motor car supplies and operate a repair shop. Corporators—Adolph Sloman, Robert St. John, Edmund L. Sloman.

New York, N. Y.—Wright's Garage, Inc., under New York laws, with $2,000 capital; to operate a garage. Corporators—William R. Dickie, 368 60th street, Brooklyn; Earl D. Wright, Elizabeth D. Wright, 511 West 160th street.

New York, N. Y.—Central Park Garage Co., Inc., under New York laws, with $500 capital; to operate a garage. Corporators—William E. Young, 59 West 65th street; George J. Johnstone, Charles A. Frueauff. 60 Wall street.

New York, N. Y.—Grant Six Co., under New York laws, with $15,000 capital; to deal in motor cars. Corporators—Clarence P. Hulst, 120 East 31st street; William G. Miller, Bridgeport, Conn.; James B. Speyer, 57 East 92d street.

New York, N. Y.—Kammer Automobile Co., Inc., under New York laws, with $10,000 capital; to deal in motor cars. Corporators—Max A. Kammer, Frances Kammer, 108 East 137th street; William Magsamen, 124 East 127th street.

Springfield, Ohio.—Kelly-Springfield Motor Truck Co., under Ohio laws, with $2,500,000 capital; to manufacture and deal in motor vehicles. Corporators—James W. Carroll, G. W. Patterson, Herbert B. Bradshaw, Walter E. L. Hook, L. W. Frost.

New York, N. Y.—Faissole Auto Co., under New York laws, with $25,000 capital; to deal in motor cars. Corporators—Alexander Karlin, 508 West 112th street; Lewis Lapides, 437 Decatur street, Brooklyn; Charles A. Faissole, 411 West 44th street.

New York, N. Y.—Automobile Information Publishing Co., under New York laws, with $10,000 capital; to publish automobile trade lists. Corporators—Albert F. Britton, Robert B. Johnston, 1974 Broadway; Freeman C. Britton, 7 West 103rd street.

Buffalo, N. Y.—Up-To-Date Auto Body and Specialty Co., under New York laws, with $2,500 capital; to manufacture motor car bodies. Corporators—Ludwig Dreyer, Emma H. Dreyer, both of 17 Huntington Place; George P. Askin, 256 West Tupper street.

New York, N. Y.—Auto Bankers, Inc., under New York laws, with $5,000 capital; to deal in motor cars. Corporators—Clyde E. Black, 601 West 162nd street; J. Lester Fierman, 1948 Prospect avenue; Samuel W. Schwartz, 882 Eastern Parkway, Brooklyn.

Changes Among Prominent Tradesmen.

John A. Bell has been appointed manager of the White Co.'s branch in Chicago. He succeeds James E. Plew, resigned.

J. M. Evans has resigned his post as advertising manager of the Lozier Motor Co., of Detroit. He has become identified with an advertising agency which will handle the Lozier account.

N. S. Gotshall has been appointed manager of the recently organized St. Louis Lozier Co., in the Missouri city of that name Previously Gotschall was a member of the Lozier factory traveling staff.

Walter H. Van Deusen, assistant sales manager of the Abbott Motor Co., has resigned that position. It is stated that he is likely to become head of a new company which is now in process of organization.

David M. Averill has been appointed manager of the Chevrolet Motor Co. of Detroit. Previously he was superintendent of the Durant Dort Carriage Co., of Flint, Mich., the officers of both companies being closely related. F. Goodwin succeeds to the vacancy in the Durant Dort organization.

H. E. Doty, who for the past six years has been identified with the White Co., has been appointed manager of the Haynes Automobile Co.'s Chicago branch. The territory controlled by the branch has been enlarged until it now includes Illinois, Iowa, and parts of Wisconsin, Indiana and Michigan.

A. W. Jones has been promoted to the management of the Ford Motor Co.'s branch in Houston, Tex. Previously he was connected with the Ford branch in Seattle. He succeeds M. Skinner, who has been transferred to Portland, Ore., where he will have charge of the Ford assembling plant which is now in course of erection.

Stanley Whitworth, factory superintendent of the American Motors Co., of Indianapolis, has resigned that post to join the McCue Co., of Buffalo, N. Y. Before he departed to assume his new duties he was presented with a diamond ring by the workmen and his other associates in the American company. His successor, B. J. Cline, made the presentation speech.

George S. Salzman has resigned as factory manager of the Amplex Motor Car Co., of Mishawaska, Ind. He has let it be known that he probably will become the head of a new company which is being organized to produce a popular priced car. That all is not happy in the Amplex company, despite its recent reorganization, is indicated by the report that W. J. Mead is contemplating relinquishing the presidency.

A. J. Sarjeant has been appointed manager of the branch which the Ford Motor Co. is making ready to establish in St. Paul, Minn. Sarjeant formerly was manager of the Northwestern Automobile Co. in that city, which handled the Ford car, and, therefore, will be familiar with his new duties. Pending the erection of the assembling plant which the Ford company will erect in Minneapolis, a temporary branch has been established in the Great Northern Implement building in that city, of which C. C. Hildebrand, who was successively sales manager of the Stevens-Duryea and Chalmers companies, will be in charge.

Recent Losses by Fire.

Bluestone, Minn.—Goembel Garage, damaged. Loss, $4,000.

Kent, O.—Miller & Schlarb, garage destroyed. Loss, unknown.

Forest Hills, N. Y.—Louis Nagle, garage damaged. Loss, $2,100.

Kent, O.—Miller and Lonnie Schlarb, garage damaged. Loss, $20,000.

Greenwood, S. C.—J. I. Chipley and T. B. Meacham, garage destroyed. Loss, $3,500.

New York, N. Y.—New York Mail Co., 525-31 West 15th street, garage and 20 cars damaged. Loss, $5,000.

Pittsburgh, Pa.—219-221-223 Beatty street, garage and six cars destroyed. Loss, $20,000, as follows: Abbott-Detroit agency, six cars, $11,000; Essenkay Co., $2,000; Beatty Auto Repair Co., $500; building, $6,500.

Business Troubles.

The Overland Auto Garage, of Cuero, Tex., is in the hands of a receiver; W. R. Garrett is liquidating its affairs.

Frederic Tudor of Boston, president of the National Automobile Association, has filed a petition in bankruptcy; his liabilities are $110,071; assets are nothing.

Application has been made for a receiver for the Southwestern Motor Car Distributing Corporation of Memphis, Tenn. P. A. Dougles is the petitioner.

Edwin D. Bechtel has been appointed receiver for Claud A. Perkinson, who was engaged in the automobile tire buisness at 2330 Broadway. The court authorized the receiver to continue the business for a period of 15 days.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, OCTOBER 24, 1912

ACCESSORIES AS HARDWARE "HERITAGES."

One of the hardware journals which is banging cymbals and beating tomtoms in an effort to induce hardware men to lay hands on the automobile accessory business declares that such accessories are the "heritage of the hardware man," further asserting that he is "best equipped to handle the business."

So far as made clear, automobile accessories constitute the hardware man's "heritage" because they will "replace the carriage hardware killed by motor vehicles." To bolster up its campaign, the journel in question quotes a hardware man who maintains that garages do not carry a complete line of accessories, that they lack capital and that garage men, anyway, are mere mechanics, or unknown business men, "not accustomed to figuring profits on a business basis." As a result, he adds, the garageman "buys without judgment and sells at exorbitant prices, thereby driving business out of town." On the other hand, the hardware man, according to his spokesman, merely lacks a halo to make him appear a commercial saint.

It is plain to all who have eyes, however, that hardware men already have laid strong hands on automobile accessories and, in many places, are making the most of them; and there is every evidence that their belief that they constitute their "heritage" is growing. Such belief may appear more or less amusing, but whatever may induce hardware dealers to recognize the opportunities afforded by automobile accessories is wholly to their credit and is likely to prove to their profit.

All progress they may have made, or any progress they may make, is at the expense of the automobile dealer and the garage man, for it requires no argument to demonstrate that the sale of automobile accessories is a natural adjunct to the sale of automobiles. The automobile dealer or garage man who does not recognize the fact, and turn it to advantage, will have only himself to blame if ultimately it proves that a most desirable business has passed into the control of the hardware merchants. It is to be hoped they will awaken to the situation before it is too late.

REPAIRING PARTS VS. REPLACING THEM.

The effect of American motor car manufacturing methods, which permit the production of parts in quantities with the utmost accuracy and excellence of finish and at exceedingly low cost, is most conspicuous in the rapidity and cheapness with which really good cars are built. The accuracy of the parts and their low cost, however, have had a marked effect on the repair end of the business, though the results are not so prominently displayed.

Time was when every effort was made to save a broken or damaged part, and no small amount of time and money went into the execution of elaborate and clever repair work. It is being found increasingly expedient, however, to throw out such parts and replace them with new ones, not only because it is quicker, but because the car is as good as new at the repaired part; because there is no doubt as to the integrity of the component, as there frequently must be when a repair is made; because the work can be done with cheaper labor and less expense for machinery, tools and material—because, in short, it is more satisfactory to both owner and repairer.

The custom of keeping spare parts in stock and using them to make replacements where such a proceeding is clearly of advantage to both parties concerned is spreading among repairmen; but there still are many who adhere, with what may be called stubbornness, to ancient ways of doing things. It is time that the practice of making repairs where renewals would be better was abandoned, and there are very many cases in which it can be abandoned with profit not only to the repairman but to the owner—especially if the charges made for new parts are as reasonable as owners are discovering they should be.

POSSIBILITIES FOR GASOLENE METERS.

With the price of gasolene high and a natural tendency toward more careful surveillance of the amount of fuel consumed per mile, or rather, to put it in more common terms, the number of miles per gallon obtained, it would seem that there is plenty of room for a simple gasolene meter operating somewhat on the principle of the water or gas meter. If such a device could be made cheaply, and there is reason to believe that it could, a glance at its dial would serve to show the driver exactly how much fuel had been used up between indicated points en route. Not the least of the advantages of such a device would be that it would form a record of the amount of fuel used in a month or a season without the necessity for computations.

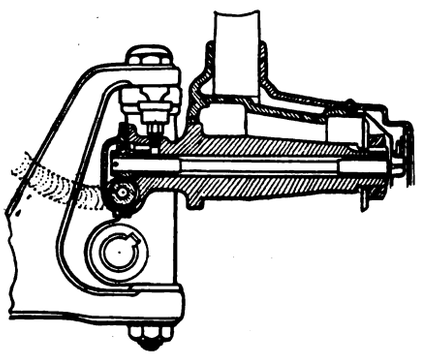
"OPEN DOOR" POLICY THAT PREVAILS IN MANY GARAGES

Astonishing Freedom That Chills Patrons and Invites the Light-Fingered Gentry—Remedy Available.

In one respect, garage men, particularly owners of large establishments, are unusually fortunate in that they are not made the subjects of innumerable claims for petty thefts. For it is a peculiar condition of the garage business that utter strangers are permitted to enter and roam about the premises almost at will. It is rare, indeed, that anyone halts them or makes inquiries as to the purpose of their calls.

So general is this laxness in the larger garages that anyone possessed of light fingers, and the inclination, may easily detach lamps, spare tires or anything which may be unsecured, and the wonder is that there have not been more of such thefts. Indeed, it seems almost possible that any crook possessed of sufficient nerve easily might make away with a car.

How long such conditions will be suffered is, of course, problematical, but it does seem that, as a matter of self-interest, garage men should do something to remedy the situation. As it is no unusual complaint on the part of patrons of garages that answers to telephone calls frequently are delayed to the point of exasperation, it would seem that the garage men easily might employ a boy or a girl whose business it would be not merely to attend to the telephone but to receive strangers when they visit such places in person. The loss of a single prospective patron who may be unfavorably impressed by the ease with which he is permitted to roam at will and without question or attention would be more than sufficient to offset the minimum salary that the employment of such a boy or girl would entail.



Klaxon Cash for Bulb Horn Letters.

Convinced that the bulb horn is an "institution," used as a matter of custom and not by reason of merit, the Lovell-McConnell Mfg. Co., of Newark, N. J., manufacturer of Klaxon horns, is offering $250 in 12 prizes for the 12 letters received up to December 15th in which are given the best reasons why that type of signal should be replaced by a more modern device. For the best letter the award will be $100; $50 is offered for the next best, and $10 each for the 10 next best. Conditions of the contest are few and entail principally that letters shall be not more than 350 words in length; that they shall be written on only one side of the paper; and that they be addressed to the Lovell-McConnell Mfg. Co., Desk No. 28, Newark, N. J.

Little Known Features of Well Known Cars

Although not all cars are sold fully equipped, it is rare indeed that the equipment, however scarce, does not embrace a speedometer. Yet, general as is the practice of supplying the instrument, in nine cases out of ten absolutely no provision is made by the designer of the car for speedometer attachment, and the adjustable swivel drives designed for attachment to cars of all makes and supplied by the speedometer maker, are universally used.

With the Lozier car, however, cognizance is taken of the fact that since the speedometer is regularly supplied with each machine sold it has become really a part of

LOZIER STEERING PIVOT

the car and not an item of equipment, with the result that in place of the more or less vulnerable adjustable drive which usually is employed, a drive which is made integral with the stub end of the steering axle is supplied.

As shown in the accompanying sketch, the drive consists of a shaft protruding through the axle stub and caused to rotate with the wheel hub by virtue of a spring contact. The interior end of the shaft carries a small helical pinion which engages with a second pinion carried on a short shaft to which is attached the orthodox flexible shaft which reaches to the indicator positioned on the dash. Both of the gear wheels are completely enclosed to prevent the ingress of dust and the egress of the lubricant which is supplied from a compression grease cup mounted on the upper portion of the housing. The arrangement has much in its favor in the way of suppressing noise and lengthening the life of the driving apparatus, and protecting it from knocks which cause disarrangement.

October 24-27, San Antonio, Tex.—Track races under the auspices of the San Antonio Automobile Club.

October 26, York, Pa.—Track races promoted by the York Motor Club.

October 26, White Plains, N. Y.—Track races under the auspices of the White Plains Agriculture and Fair Association..

SOLUTIONS OF THE USED CAR PROBLEM

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Four Best Articles Dealing With the Subject.

By JOHN A. THOMPSON, East Lynn, Mass.

In order to put the used car business on a sound basis, it is necessary to evolve a fair and honest method of handling it, and as a first consideration, I suggest that dealers refuse to take in trade any used cars, and instead that they sell them for their owners on a five per cent. commission basis, only good cars of not more than three years' life to be considered. There are many used cars sold that are veritable old junks that are not safe to be on the highways, and these really ought to be condemned by the registration boards of the various States.

Secondly, I suggest that the prices of used cars be fixed according to a standard of depreciation, so that no car more than one year of age shall be sold for more than half its list price, and that its selling price be reduced by 25 per cent. for every year up to three years and after the first year that it is in use. This scale of prices, I think, is about what should prevail, and would result in many quick sales. The cars would be turned into cash, the purchaser would be satisfied and the dealer would keep his floor clean.

If each dealer would agree to handle cars of no other make than that for which he is the agent or representative, it probably would help solve the problem. Each dealer then would have only his own particular brand of cars to deal with and his establishment would not be cluttered up with a miscellaneous assortment. It seems to me that any dealer would rather stick to the line he knows best than to sell all kinds of used cars. Of course it is a rather complex question as to what we are to do with these used cars, but we have them in our territory and so we must make the best of them.

After all is said and done, there is a market for all good used cars, but the price is too high in most cases and people will not give two-thirds to three-quarters list price for automobiles that have seen service.

In order to make plain my schedule of prices let me cite a common instance: An owner desires to dispose of a used car; he "has had it only 18 months; driven it 3,000 miles; given it the best of care." Nine times out of ten he has really driven it about 13,000 miles and scarcely has given more than a tinker's dam how he used it or abused it. I think that any owner gets the best half out of his car the first year he uses it and it is on that basis that I have reached my scale of figures.

In my opinion it is much better to have some one do all the second hand business than it is to have floor space occupied by a number of different makes of cars, some of which are obsolete. Many times their presence is the cause of losing sales of new cars.

The curtailment of manufacture is impossible, of course, by reason of the close competition and the necessity for turning out a great number of cars in order to reduce "overhead" to the point where success may be obtained. But if it could be arranged so that the manufacturers themselves would buy in all used cars and rebuild them so that they might be sold at about two-thirds their list price, this might prove the solution of the used car problem. As it is, it is a feature which we must try to regulate, though I do not think we can eliminate it.

By IRA G. SMITH, Chicago, Ill.

In seeking solutions of the used car problem, it seems to me that it will be of value at least to attempt answering that time-worn question, What becomes of all the old cars? If the question is squarely faced, and an answer obtained, it will point out the ultimate destination of the used cars, which light in itself considerably will illuminate the situation.

As I see it, the destination of the increasing number of used cars is the farmyard. I believe that they will become so cheap that almost any farmer will be able to buy one, and that they will be put to uses of which the average automobile manufacturer does not dream. Some of them will be purchased for pleasure use, more of them will be bought for business purposes, others will be converted into light trucks with which butter, eggs, etc., may be brought to town, while as many more of them will be sold to industrious young men on the farms, who will remove the motors from the cars and use them for running machinery on the form; and when I say machinery I mean separators, washing machines, water pumps, feed grinders, etc.

Converting old cars into light delivery trucks is being done to a considerable extent at the present moment in Chicago, also in many small towns. When the old cars have served these purposes, they will be about ready for the junkman.

TWO PROBLEMS SOLVED BY FREE SERVICE.

Overworking the word "service" has brought a lot of unnecessary trouble on the shoulders of the automobile dealer. It goes without saying that the purchaser of a motor car has a right to expect a certain amount of attention. But what this amount should be in dollars and cents requires careful figuring and the customer should not be allowed to exceed the limit.

One New York dealer who is making money follows the plan of charging off $50 for service for every car he sells. This is credited to the account of the purchaser of the car without the purchaser knowing anything about it. The value of the car sold is close to $2,000. Within a week after the car has been delivered a note is written to the customer requesting him to bring in the car so that it can be looked over, and the garage foreman is given a card for this customer.

Details Thoroughly Gone Over.

When the car is brought in it may be a matter of, say, six hours' time to inspect it carefully, adjust loose bolts, see that carburetter and ignition systems are working perfectly and that every bearing and moving part is properly lubricated. A note is made of any point that has been neglected by the purchaser and it is reported to him. He is requested to bring in the car again at the end of the second week, and the same process is followed. Each time a careful, accurate record of the labor is kept and a charge made against the fifty dollar credit for service originally made. Incidentally, a bill is sent to the customer each time with the record of labor, hours, etc., and the whole bill stamped "No charge," though it is actually charged against the service account of his car.

These requests to bring in the car and have it looked over are followed up at periods of one month and six weeks, the period of time extending as the customer gets more accustomed to the car. Always, however, it is the dealer who is continually on the track of the customer to see that he is getting satisfactory use from the machine.

Set a Limit and Abide by It.

The dealers who were clever enough to work out this knotty detail solved two problems at one time. They solved the problem of knowing exactly what service was going to cost them on any new car they sold and they solved the problem of impressing on their customers in a tactful way the fact that they were actually giving them a very real sort of service. The result of this plan has been a marked increase in sales to old customers and a reputation for service second to none in New York. The customer is taken care of up to the full amount within a year. But beyond that amount the dealer does not go, and when he shows the customer in detail what he has done for him it requires no further argument that they have been mighty liberal with free service.

Incidentally, these dealers do not cut prices nor take trade-ins at inflated values. And the best of it is that purchasers do not expect it, because each customer is a booster. Other dealers to whom the idea appeals will do well to note that this free service is given as carefully and accurately as if it were charged for—and as far as the men in the garage know, it is charged for. Give a service free and let the repairmen know it is free, and it has a tendency to make them careless. And there is no customer who would not rather pay for good service than have indifferent service thrust upon him gratuitously.

TO ENSURE PROPER WINDOW DISPLAYS.

Inquiry among many dealers in many different places discloses the fact that one reason for so many poor window displays on the part of automobile dealers is that the "boss" desires to attend to it himself but usually is too busy. The result is that nobody attends to it.

The only way to ensure proper attention and display is to place the responsibility for it definitely upon the shoulders of some one individual and let him make a study of it. This will develop originality and individuality, and the man who has the respensible will take pride in securing attractive effects. Should it be the proprietor? If he has no competent interested salesman, yes. If he has good, live, wideawake, business-getting salesmen, let him turn it over to one of them. Naturally such a salesman will watch the displays of competitors and beat them if he can. Such a man soon will love the work for its opportunities, and looking after the displays will develop a keenness and power of observation that will help him personally as well as the concern for whom he works.

SELLING A CAR VS. DISPOSING OF IT.

"No man who cuts prices can hope or expect to build up a real business organization," declared E. W. Steinhart, president of the Cadillac Motor Co., of Indiana. "One trouble is that only the proprietor (and sometimes not even he) can tell when the bottom has been reached, and thus all stimulus to individual effort and intensive salesmanship is lost.

"You haven't sold a car when you have cut a price—you have simply 'disposed' of it," adds Mr. Seinhart. "When you 'sell' a car you have worked up the prospect by giving straight from the shoulder facts about the construction and merits of the car you are offering so that he is convinced that it is the best that can be had for the money. You must feel this yourself, or you cannot make the prospect feel it. When

Digitized by Google

you have made him feel it he will realize that price is an incident and quality the important thing."

Know All Points About the Car.

This kind of salesmanship means that you must study your car and know its every point from tail lamp to tip of front spring, from tires to top, inside and out. The salesman who follows this plan will never be in the position of the salesman who told the boss that "he could have made the sale if the car had only been equipped with spiral timing gears like the Star car. "Why, you darn fool," retorted the boss, "we had spiral gears sixteen months before the Star had them!" Unfortunately, the salesman did not know it and he didn't make the sale.

Appearances May Be Deceptive.

As an example of the other sort, there can be recalled a salesman who spent about a month in a factory learning about the car and then spent two weeks on the floor, catalog in hand, checking up the various features. This salesman stood there, book in hand, seemingly in meditation. He was a little fellow. But his eyes were bright and he had wonderful power of concentration. In six weeks he knew more about the line of cars he was selling than some men knew after six years. He got right down to the bottom of things, and, plain, ordinary, common looking chap that he appeared to the office men, he developed the biggest business that the factory ever enjoyed from the territory he covered. Incidentally, the prices were always maintained and the customers held fast. He "sold" the cars to them and they stayed "sold."

LACK OF THOROUGHNESS IN REPAIR SHOPS.

When it is remembered that the price of an automobile runs up into hundreds or thousands of dollars, it is not unreasonable to believe that the dealer or repairman should exert as much care to prevent soiling the car as a barber exerts when performing a 15-cent shave or a 25-cent hair cut. The barber protects the clothes of his customer; the repairman seldom, if ever, thinks of protecting the car.

As an instance, a new automobile was brought back to the dealer who sold it to have some work done exactly one week after the car had been sold. It was a matter that came strictly under the head of service. The motor starter did not work and some wiring of a minor sort was disconnected.

Dirty Workmen Are Bad Workmen.

The car was left with the dealer for two days. When the owner delivered it the top was up. When it was returned to him the top was down and the clean gray lining of the top that was perfectly new when the car went in for repairs, was smeared with grease from the mechanics' dirty hands and the linoleum-covered running board showed similar evidence of the careless workmanship. There was grease on the leather cushions and grease on the floor boards, where dirty tools had lain.

When he found what had been done, the motorist who had invested considerably over fifteen hundred dollars in the car expressed himself so forcibly that the argument that ensued caused him to take his patronage elsewhere and to speak no kind words of the dealer whenever his name chanced to be mentioned.

One shop which learned its lesson early covers all cushions with a cloth and running boards with canvas, and after the job is completed the shop foreman inspects the car and makes sure there is not a mark or spot that should not be there.

ITEMS THAT ENTER INTO PROFITS

Generally speaking, but five elements enter into the cost of every article sold, and ...ese items fit the automobile dealer's ...tion as clearly and comprehensively ...ey do the situation of the manufac-...

Five Items Constitute Cost.

...e five items to be considered in fixing ...es are: (1) Material, (2) Labor, (3) ...erhead, (4) Selling Cost, (5) Profit.

In the dealer's case, except on a repair ...ob, the charge would represent the cost ...of the finished product, plus the freight. Before the dealer can know whether or not ...is selling price is yielding a profit he must ...dd to the "material" cost the price of ...Labor"—that is, the cost of fixing up a car ...fter it is unloaded, or everything he has ...spend between the freight car and the ...w room, and to this every responsible ...er will add the cost of protecting his ...rantee, or a "service" ...rge. Then ...s "overhead," which includes store ...t, or interest on investm...t in building, ...ipment, etc., light, heat, ... phone, of... expense, salaries, etc., ... all other ...ed charges.

To these items he must ...ld "selling ...st," which, generally speak..., includes ...dvertising in all its phases, co...missions to ...lesmen, travelling expenses, etc.—everything that can legitimately be charged to ...selling.

Calculate Profits in Time.

Then comes the item of profit; and unless ...he selling price will stand its share of all ...the rest and permit the addition of a profit, the dealer cannot expect to realize much of a profit.

Some dealers do not reckon selling cost except in a very general way. But they must know exactly what it amounts to before they can build on a "sure foundation," and if they cannot find out what it is, they will be wise to quit the business before the sheriff forecloses on them and forces them to do so.

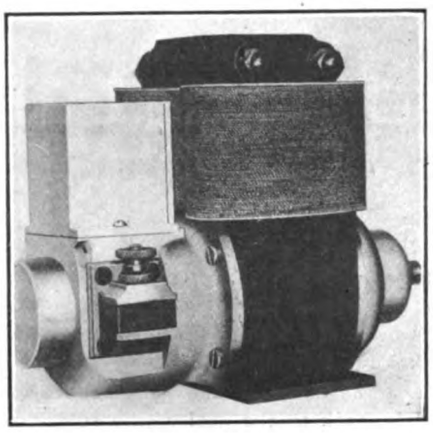
OLD LINE MANUFACTURER DEVELOPS LIGHTING SYSTEM

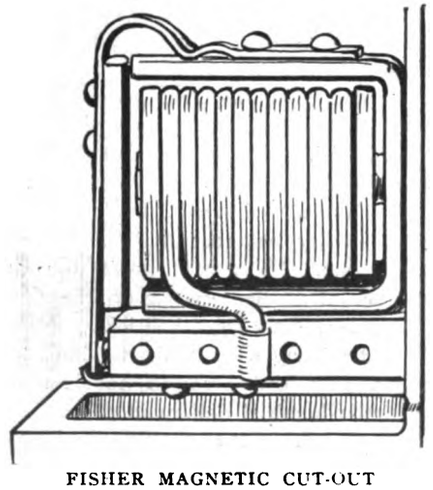


Fisher Generator Is of the Self-Contained Electrically Regulated Type —Constant Voltage and Increasing Amperage.

Emphasizing appreciation of the unmistakably growing popularity of electric lighting systems and the natural tendency toward their adoption as the solution of illumination problems, the Fisher Electrical Works of Detroit, Mich., after several years years' experimentation, just has brought out a dynamo electric lighting system embodying a number of features characteristic of its producer's 35 years' experience in the construction of electrical equipment of practically every description.

In developing the Fisher generator, cognizance has been taken of the desirability of simplicity and the reduction of necessary attention at the hands of the owner to the minimum. To this end, the dynamo has been made entirely self-regulating within itself and without the addition of resistance coils, manual or mechanical regulating devices. Incidentally, it operates at crankshaft speed, generating full voltage at 300 revolutions a minute, thus eliminating many of the difficulties inherent to high speed machines and reducing wear and tear on the armature bearings. Its principal characteristic is that the current output never exceeds a maximum of eight amperes throughout a range of armature speeds between 300 and 2,000 revolutions a minute. The weight of the machine is 24½ pounds.

In appearance, the Fisher generator suggests not a little the well-known Edison type dynamo, which for a long term of years has been the recognized standard in construction. The fields are of the inverted U type, which design was chosen as much for its applicability under practically all conditions existing under the present regime as it was for its electrical efficiency. This construction permits the minimum distance between the center of the armature shaft and the base of the generator; in the generator illustrated the distance is 1¾ inches, including a non-magnetic baseplate 3/16 of an inch in thickness. Owing to the construction of the base, any shape or thickness of mounting plate may be used, the minimum distance between the center of the armature and the base plate being realized when the machine is mounted directly on the aluminum crankcase of the motor.



Reflecting modern practice, the fields and pole pieces of the dynamo are drop forged of material particularly suitable for the generation of a magnetic field of maximum intensity. These field and pole pieces are accurately machined and are interchangeable. They carry the field coils which are wound directly on the drop forgings in the usual manner. The armature is of the drum-wound type, with straight slots only semi-closed by the winding, which consists of cotton covered wire, enameled and afterward baked and treated with an oil and

FISHER U-TYPE GENERATOR

waterproof varnish, making it to all intents and purposes impregnable and practically indestructible. The armature shaft is steel and is mounted in high grade ball bearings of liberal capacity.

Unusual care in construction is revealed

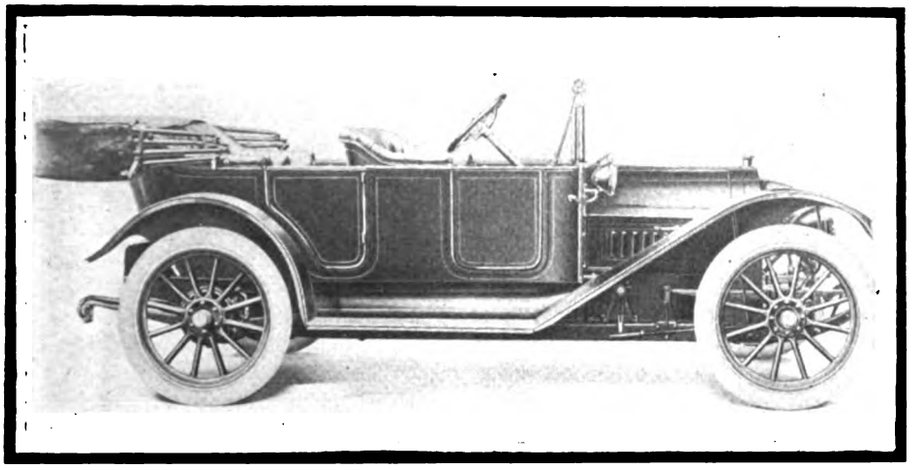
FISHER MAGNETIC CUT-OUT

in the commutator, which is formed of hard drawn copper, thoroughly insulated, with mica band rings and segments. It is assembled without the use of screws of any kind, though its rigidity is no indication of their absence. The brushes, which are held in place by cover springs and thus are easily removable for replacement in the event of wear, are formed of copper mesh carbon and are equipped with pig-tails by way of ensuring positive collection of the current. End plates are aluminum, accurately machined and interchangeable.

The automatic cut-out, indispensable to all such systems, is an electro-magnetic device mounted in a tight housing directly over the commutator, where it is instantly accessible. In its simplest aspect, it is merely an electro magnet connected in such a way that when the dynamo current exceeds the battery current, the cut-out coils become energized and drawing a movable armature mounting a contact against another contact which is held stationary, establishing a connection between the dynamo and the battery. Of course, immediately the engine is stopped, the cut-out armature returns to its normal position under the action of a spring and thus breaks the connection between the dynamo and the battery, preventing the latter from discharging itself.

As indicated by a capacity curve, the generator delivers its full voltage at 300 revolutions per minute, and at 380 revolutions current of one ampere is passed to the battery. At 950 revolutions the current curve rises to six amperes, and from that speed up to 2,000 revolutions a further gradual rise to eight amperes is made. The theory behind the design is, briefly, that it is the better proceeding to charge a battery continually at a low rate than it is to charge periodically at a high rate, which may or may not be deleterious to the battery.

Tire Wear and "Squareness" of Wheels.



Although it is fairly well known that tires will not last and give service for the length of time stipulated in their guarantees, if wheels are not properly lined up "square" with the chassis frame it is not generally known that to measure for "squareness" merely by making certain that the distance between the fronts and rears of the same set of wheels is the same is not sufficient. After a car has been driven for a couple of seasons, or even less, its springs "settle" to a certain degree, and unless they all "settle" the same amount the axles may be thrown slightly out of alignment. Front springs, where no radius rods are provided, are the most frequent offenders in this respect. The fact that cars are driven considerably with but a single passenger, and he the driver, thus placing more weight over the right front spring, serves to augment the trouble. Periodically, the front wheels in particular should be tested to make certain that they are parallel with the chassis, the easiest method of making the test being to stretch a string parallel to each of the front wheels and to the chassis; in this way discrepancies may be checked. In some cases it may be possible to correct slight disalignment by shifting the spring pad, although in others nothing remains but to fit a new spring or springs.

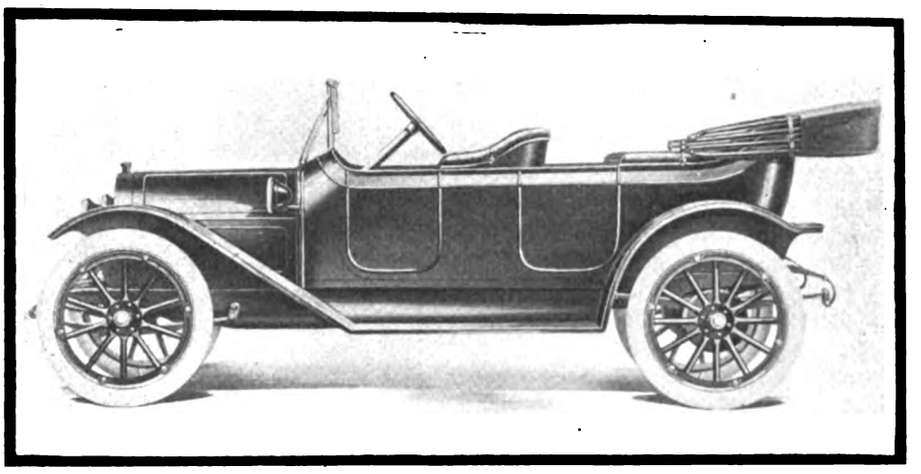
NEW REGAL OVERHUNG IN UNDERSLUNG LINE OF CARS

Has Low Center of Gravity, However, and Prepossessing Appearance Due to Its Spring Suspension—Underslung Models Refined.

Conspicuous as being among the comparatively few embodying the underslung principle of contsruction, the Regal line of cars, which is produced by the Regal Motor Car Co. of Detroit, Mich., has been rendered a bit more conspicuous by reason of the addition of a brand new model designed after the pattern of the older model L 30-horsepower car, which for several seasons has been the sole remaining Regal exponent of the more conventional method of mounting the frame above the axles instead of below them. With but few alterations to change either their appearance or their construction, the two underslung chassis, models T and H, are continued.



REGAL MODEL T UNDERSLUNG TOURING CAR, WHICH SELLS FOR $950

New Model Largest in Line.

The new car is styled model C, and though nominally its frame is of the overhung type advantages of greater stability inherent to the older model L car have been retained in the new model by mounting the front springs beneath the axles instead of over them and thus materially lowering the center of gravity of the car. The rear springs are mounted in the orthodox manner above the axles, though they are of the three-quarter elliptic type and thus differ from the full-elliptic springs used in the older model. It is but natural that the new model should reveal many of the Regal earmarks, though the component parts themselves are larger throughout and stronger and exhibit a well-defined tendency toward a general refinement of design.

The power plant of the new car is a four-cylinder block-cast motor of the long stroke type in which the bore and stroke measure 4 inches and 5 inches, respectively. The motor, which is shown by the accompanying illustration, presents an unusually clean and compact appearance, due in part to the judicious disposal of its accessories, such as the magneto and water pump, and in part to the integral coring of the intake and exhaust passages. One of the distinctive features of the engine is that the crankcase is divided along the line of the crankshaft in such manner that the upper main bearings, which are three in number, are supported in the upper half of the case, while the lower bearings are supported by caps held in place by heavy studs, increasing the accessibility of the bearings and permitting unusual rigidity of construction. The motor is mounted on the main chassis frame by means of extending arms cast integral with the crankcase. Cooling is effected by pump circulated water, air draft being induced through the radiator by means of a ball bearing mounted fan carried in an adjustable mounting. For ignition, a dual high tension system is employed; lubrication is by the conventional constant feed pump over splash system.

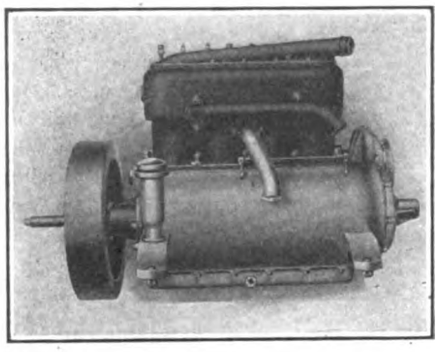
REGAL FIVE-PASSENGER MODEL C OVERHUNG TOURING CAR

Standard Regal Construction.

In the design of such units as clutch, propeller shaft, change gear mechanism and axles, the standards set by the earlier Regals have been followed fairly closely, differences in the sizes of parts commensurate with the greater power of the engine having been made as a matter of course. The clutch, therefore, is of the cone variety, providing liberal engaging surfaces, and the change gear mechanism is of the selectively controlled three-speed type; the same gearset is used in all the Regal cars, its design and construction having been proved over years of service.

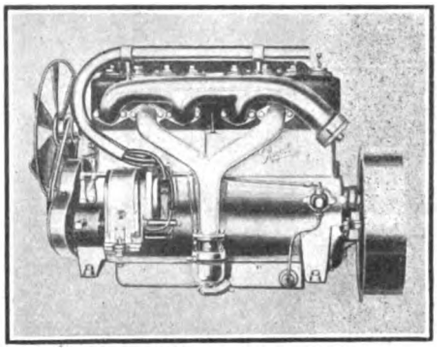
Electric Lights in Equipment.

The wheelbase of the new car is 116 inches and provides liberal base for the use of a roomy body in which the comfort of passengers has been the main consideration in design. From a purely esthetic point of view, the body presents an appearance inherent to well-blended lines and the substitution of curves for angles wherever possible. Lending an air of distinction to the idea embodied in the design, a 2½-inch band encircles the top line of the body and is finished in light blue, in contrast to the darker shades of the body and running gear. Metal parts are finished in nickel plate. Demountable rims are a feature of regular equipment and the wheels, both front and rear, are shod with Morgan & Wright 34 x 4 inch tires.



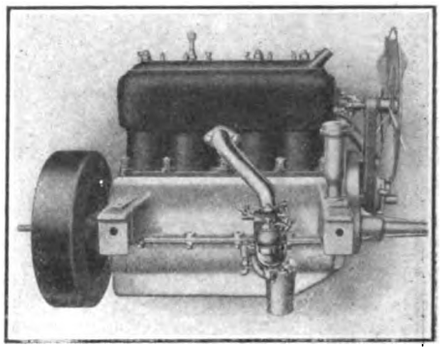
In the matter of equipment, which is included in the selling price of $1,250, little is left to be desired. It includes an electric lighting system consisting of a storage battery of liberal capacity and the usual complement of head, side and tail lamps (gas head lamps and Prest-O-Lite tank are optional equipment), mohair top with boot

Digitized by Google



and side curtains, windshield, speedometer, electric horn, tools and tire repair outfit.

As has been stated, the revision of the two underslung chassis in the line has altered but little their familiar construction. The larger of the two models still employs its 4¼ x 4½ inch motor, in which the cylfolds attached in the orthodox manner. Both are equipped with high tension dual ignition systems and are cooled by the thermo-siphon system. In both models, clutch and gearset are the same, the former being of the well-known Regal cone variety and the latter of the three-speed selectively opershield and speedometer also are included.



By way of rounding the line out and making it as complete as possible, it also includes a clever underslung three-passenger coupe mounted on the model T chassis and listing with complete equipment at $1,250, and an underslung roadster, styled

REGAL MODEL T MOTOR

REGAL MODEL H MOTOR

REGAL MODEL C MOTOR

inders are cast in pairs. Similarly, model T retains its 3¾ x 4½ inch long stroke motor with but few alterations, and those that have been made affecting efficiency rather than appearance. These two motors differ in that the latter is block cast with its intake and exhaust passages cored integral whereas the former has its cylinders cast in pairs with the intake and exhaust manated kind. The wheelbase of the larger model (model H, which rates at 36 horsepower) is 118 inches and, with the same equipment as listed for model C, it sells at $1,400. Model T, which really is the leader in the line, and lists at $950, mounts a modish five-passenger body and the equipment is the same, with the exception that $75 is added to the list price if top, windmodel N and mounted also on the same chassis, carrying the long-stroke 3¾ x 4½ engine. The roadster lists at $900, including the following equipment: Option of either electric lights and storage battery or gas head lamps and Prest-O-Lite tank, electric horn, tools, tire repair kit and jack. The addition of top, windshield and speedometer increases the price by $75.

Tool Steel That Saves Much Labor.

One of the curious phases of the modern development of steel for cutting tools used in manufacturing metal articles is the fact that some of the steels can be made to cut so fast that they attain a dull red heat, and still do not lose their hardness or cutting qualities. Such steels do their best work when so hot that ordinary tool steel would be as soft as machinery steel and, of course, quite useless for cutting purposes. This remarkable tool steel is the basis of the amazing rapidity with which motor car parts are turned out, not only permitting fast cutting, but also minimizing the time required for grinding and re-setting tools. The material of which such tools are made is styled "high speed" tool steel and may be obtained in wide variety.

Utilizing a Motor to Start a Motor.

In the motors of gasolene tractors it is impracticable to obtain high power by running at high speed, and so the other alternative is taken; the cylinder dimensions are made sufficiently ample to enable the motors to develop the required power at a medium or slow rate of speed. These big, heavy motors are naturally hard to start, because of the very considerable amount of power required to turn them over. In the case of a motor such as that which drives the 105 horsepower tractor shown in the accompanying illustration, the product of the Daimler Co., Limited, of Coventry, England, the starting would be almost too big a task to be accomplished by hand, so a small air-cooled motor is installed for the

DAIMLER 105-HORSEPOWER TRACTOR

purpose, taking gasolene from its own separate tank and driving the crankshaft of the main motor through a chain and suitable gearing. The arrangement of the starting motor, tank and chain drive are clearly shown in the illustration.

To Test Shock Absorbers in Belgium.

In Belgium, where a series of tests were made which threw more or less light on the problem of mudguard efficiency, another series of tests, this time to determine the jar and jolt lessening proclivities of various types of shock absorbers, soon is to be held. The Automobile Association of Belgium has arranged to carry on the tests, and they will be made on a "specially roughened" piece of roadway one kilometer in length. A speed of 25 miles an hour will be required, and the nature and intensity of the vibrations produced on the chassis will be recorded by means of a special instrument the records of which will form the basis for the judges' awards. After tires have been inflated to a predetermined pressure, each car will be required to make two trips over the course, one with the shock absorbers in place and one with them disconnected. More specific conditions of the contest have not yet been made public.

Care in Choice of Hacksaw Blades.

A hack-saw for cutting brass, copper or other soft metal should have coarser teeth than a saw employed for cutting iron or steel. For cutting thin metal, whether sheet or tubing, fine teeth are best. By observing such precautions, it is possible to make saw blades last much longer than if inappropriate grades are used.

REILLY ARRAIGNS "ONE MAN" ESTABLISHMENTS

He Boils Over After Seeking to Do Business in Two Places That Lacked Lieutenants—Shows the Need of Delegating Authority When "Boss Is Out"—The Reilly Way Explained.

Whether a tightly fitting hat is conducive to self-control during moments of mental disturbance or at times when the owner of the hat is provoked to anger, is a problem for psychologists; whatever the answer, as Reilly emerged from a big store dealing in accessories he jerked down his knockabout hat over his forehead and, looking neither to right nor left, moved rapidly down the street. Two blocks further he went into a second accessory house and, endeavoring to appear more pleasant than he felt, approached a salesman.

"Do you carry a line of mechanical horns?" he asked.

"Yes, sir."

Attempting Business with a Subordinate.

"What's the price to automobile dealers?" said Reilly, naming a horn and handing the salesman his card.

The salesman named a price which Reilly knew was the retail price.

"Isn't there a lower price for dealers?"

"I believe there is one," responded the salesman, "but the manager doesn't put many of those things down on paper and I wouldn't dare make a price. I'm sure, however, that he will make a price for you if you see him."

"Where is he?"

"He's out just now, but if you will come back——"

Meets with no Success, so Leaves.

"I haven't time to come back," interrupted Reilly; "I'm in a hurry. Does business stop when the boss is out?"

"Not exactly," explained the salesman, and he would have done his best to smooth things, but Reilly was almost at the door, and as he made his exit the yank he gave his knockabout hat brought a protest from the strained and almost ruptured cloth.

The four blocks between this store and Reilly's own establishment were not sufficient to permit his brain to cool, and the factory Sales Manager, who had dropped in during Reilly's absence, saw, as Reilly slapped the hat on a hook in the coat room, that trouble was written voluminously on the lofty forehead which began in the proper place but extended almost to the back of Reilly's neck.

"I just dropped in on my way through town," ventured the Sales Manager. "I also had a little business and didn't know but I would have to leave before you came

"DOES BUSINESS STOP HERE WHEN THE BOSS IS OUT?"

back, so your right hand man helped me out."

"Did he? That's fine!"

"Yes. You know, you have two cars scheduled for the first of the month. Well,

REILLY GAVE HIS HAT A YANK

we would like to have you take one now and the other the middle of next month, if you don't mind. Your assistant said it would be all right."

"All right it is," said Reilly, by this time quite amiable. "What he says goes. When I'm out he comes pretty near being Reilly."

"But why the frowns?" asked the Sales Manager.

The Capable Assistant Acts.

"The same thing that makes you look so pleasant," retorted Reilly. "You came here to do business and did it. I have been trying for a half hour to do business and didn't do it, and all because some establishments stop doing business when the boss leaves the office."

"What's the reason?"

"There is no real, sensible reason. It's foolishness! To start with, I saw a chance to use a few mechanical horns, electric or otherwise. I haven't bought any in a long time—that is, to amount to anything—so I wasn't up on dealers' prices. I went to one shop a couple of blocks down the 'row' and tried to do business, but the boss was out. The clerk who is supposed to be in charge at such times knew as much as the boss expects him to know, but he didn't dare make any promises about anything; and there you are! I probably wouldn't have been such a valuable acquisition in the customer line, but I would have been a new one, and every new one a man adds to his list means that much more business. Too many men make the mistake of making the whole business center around themselves. They don't want anyone else in the place to know as much about the business as they do, because they think they would be losing in dignity or something else.

Wrong System May Do Great Injury.

"You can see what a difference it is capable of making. You came in here to ask about something that meant considerable to you; if you couldn't have found out it would have tied things up for you in several places and the delay all around would have been injurious. But—although you couldn't find me you found someone else with whom you could do business. You got what you wanted and my assistant was able to talk as if he knew what he was talking about. Once he made the arrangement there was little likelihood of its being changed.

"It's a lesson I learned in the school of

Digitized by Google

experience. When I began business I was all alone; I didn't need a salesman, and I managed to get along without even a stenographer. But when things began to grow I got the office girl and some time ago I got my assistant, the salesman. At first I had that mistaken idea that he ought to be a sort of underling and not know too much about the business. But I gradually began to realize that the arrangement was a mistake. Personally, it kept me tied down. I had to be here every minute or stand a chance of losing business. The salesman kept running to me for every little thing and I got tired of it, too.

Developing an Assistant Manager.

"One day I had a talk with him, and told him I was going to make him my assistant, not only in title but in reality. I began to let him into the business secrets, if they may be called secrets; of course, he had demonstrated that he was a fit and reliable man. I gave him access to the office records and the correspondence and gave him every opportunity to make good on the new and broader job. The result was that whenever I was out and anything came up he handled the matter, and although I am often inclined to disagree with him in some minor detail, I seldom say anything about it. He has gained confidence, and the more he does of this work the better he gets at it. Only once have I changed any decision he made.

Knows Much of Employer's Affairs.

"To-day, for instance, he knows about the two cars scheduled for the first of the month and he knows that we have one customer who will take one anytime between now and the first of the month. That disposes of the car you wanted me to take now. As for the car you want to hold off until the middle of the next month, he knows that, so far as we know now, there is no rush for it. We are willing to be accommodating, and he knows just as well as I do what can be done. I have no hesitation in going away for a week, for I'm sure the business will go on all right. The salesman gets a good salary and commission and is the kind of man who takes an interest in what he does. He is just as anxious as I am to see the house make money, and he isn't afraid of responsibility, which is what's the matter with a whole lot of men. If I should be taken sick and be kept out of the shop for six months the business would go on as usual, without a hitch; I am confident of it.

Few Secrets Between the Two.

"One thing we are agreed upon. If I do anything or contemplate doing anything in a business way I let him know about it and, of course, it is his duty to let me know about everything he does. If it is the matter of a prospect about whom he does not happen to know all he should know, the office records will show him very nearly all he needs to know. Similarly, the correspondence will reveal considerable information of great value. One who has not attempted gathering facts from this source will be surprised at the information he can gain from rummaging through the letter files.

Diagnosing the Real Trouble.

"The trouble in the two accessory houses I visited to-day is that they are run by managers. The head offices are in New

"I MADE HIM MY ASSISTANT—IN REALITY"

York or some other far away town, and the manager of the local house likes to have it known that he is manager, or else fails to realize the injury he is doing the business, and therefore himself, by not having someone in authority under him. It certainly is provoking to go into a place and be told that you will have to postpone your business because the boss is out and no one else can take care of you. I would rather have a good assistant and have him make a few mistakes than have one who couldn't do anything at all. Even the office girl——"

Even Office Girl is an Assistant.

Reilly stopped abruptly as he saw the young woman mentioned returning from lunch.

"O, Mr. Reilly," she said as she entered, "I met Mr. Cowan uptown just now—the man who's going to get a car the first of the month—and he wanted to know if he couldn't possibly get it a few days sooner; the weather is so fine. I heard what was said this morning about our getting that car earlier, so I told him I thought he could have it in a day or two. He said he would expect it in three days unless he heard otherwise."

"All right," said Reilly; "he won't 'hear otherwise.'"

"How many capable assistants have you, anyway?" asked the Sales Manager.

"That's two that I know of," said Reilly, as the girl began to click the keys in the adjoining office.

Noises that May Arise in Clutches.

So various are the designs of plate clutches both of the "dry" and "wet" varieties that the wise repairman will carefully study the peculiarities of each individual type before desiding what is the actual trouble. "Noise in the clutch" is the commonest symptom, and beyond the fact that there is a noise, the layman cannot for the life of him tell what is the matter. In many instances the noise is a peculiar idiosyncrasy of the make of car and cannot be overcome.

A certain make of car was fitted with a dry plate clutch with seven steel male plates and six raybestos covered female plates, and while the clutch was "in" it ran as sweetly as could be desired. But disengaging it caused a grating noise which puzzled not a few. It was found, however, that after the car had run about a thousand miles the noise diminished almost to the inaudible point. The reason for this was that when the plates were new there was very little space between them, but after running for a while the surface of the raybestos became smoothed down, and the steel discs polished, the space between the plates automatically increased. The constant pressure on the raybestos has compressed it slightly, and this also had a tendency to overcome the "trouble."

When the clutch was originally designed sufficient clearance was allowed to prevent the rubbing on disengagement, but it was found that after the wear had taken place it was necessary to take down the clutch and add one or two additional plates to counteract the effect.

Mirror on Roof of Closed Cars.

By way of ensuring an unobstructed view of following traffic, the owner of a rather bulky limousine has displayed no little ingenuity in the location of a mirror for that purpose. Because it was not always possible to see clearly with the aid of a mirror placed beside him in the orthodox position, he adopted the novel method of placing it above him, on the roof of the car. As he could see the mirror, he cut a small rectangular hole in the roof, and to prevent the ingress of rain he closed it with a sheet of heavy plate glass. Under the new arrangement he can obtain an unobstructed view of the traffic behind him, regardless of the closeness of vehicles, which ordinarily obstructed his view through the mirror at the side.

MAKING STORAGE BATTERIES DO DOUBLE DUTY

How a Dealer's Sharp Eyes Saw Opportunities for Getting Extra Work Out of Accumulators—Paying for New Batteries With Work Done by Old Plates—"Wireless Transmission" of Current for Illumination.

"After a rather long and very varied experience in the electric vehicle business, more particularly at the storage battery end of it," remarked a dealer in the weighty combinations of lead, water, acid and rubber that serve to store up electrical energy, and to propel electric vehicles, "I have made up my mind that the dealer who wants to make sure of the butter on his bread in the future must lay himself out to show his customers that electricity is the best motive power for motor vehicles, under proper conditions, and that it is capable of doing better work than most people get out of it.

Assisting the Novice Pays.

"A very large proportion of the rapidly disappearing troubles that occur in electric vehicle installations is due to causes that can be overcome all the more readily because they do not originate in the electrical apparatus itself—that is to say, they are caused by misuse, misunderstanding or ignorance in some shape. A purchaser of a battery who has had no experience in that line needs a good deal of help in little things, and it pays, and pays handsomely, to take a good deal of extra trouble to help him out.

Enthusiasm Begets Enthusiasm.

"For one thing, the battery 'stays sold,' and the user is contented and is a booster for the use of electric power; and, for another thing, there is no doubt as to where he will go when he wants renewals or another battery. Besides, he is much more likely to widen the scope of his electrical activities if he is thoroughly pleased and a little more than satisfied with his first installation than if he is only half-hearted in his belief in the practicability of the electric. In other words, what I want to do is to make every customer I have just as enthusiastic as I am. I have seen both sides of the business, and I tell you I am getting more enthusiastic every day."

Remuneration May be Tardy.

One of the fixed ideas of this particular battery dealer is that there are a good many ways in which storage batteries can be made to save money for their owners, if only such openings are sharply watched for. It may take a good deal of planning and involve a good deal of work—mainly mental labor—on the part of the dealer, for which he is not remunerated directly. But, to quote the dealer in question, it pays handsomely in the long run.

Putting Theory into Practice.

A case in point will serve to elucidate the theory and its practical working. A certain manufacturer not more than a thousand miles from New York City runs his machinery with a steam plant, and he has a dynamo which furnishes current for whatever electric lighting is required during the day and the early winter evenings, and for a few electric motors, including an elevator motor. In this way his current expense was so small that it was difficult to separate it from the general running expense, and when the time came when motor vehicles were needed for the transportation of merchandise two electric trucks were decided upon. Two batteries were purchased for each, one of which was charged during the day while the other was at work in the truck. The installation is a success, from a trucking point of view, and the owner is satisfied with it.

Some battery dealers would have been quite content with such a showing, and with reason. The dealer in question, however, was not—that is to say, he was "satisfied, but not contented," to use his own expression. He wanted to arouse something akin to enthusiasm for electric power, and he watched with the proverbial "eagle eye" for an opportunity. One came.

Storage Battery Runs Elevator.

It seems that the manufacturer found it necessary to use a considerable amount of electricity at night when the steam plant was shut down, and for this purpose an electric company's service was installed and current used through a meter at an expense that was very considerable. It was the only alternative, apparently, to running the big steam engine, which of course was out of the question owing to the size and expense of such a proceeding. Here the battery man came to the rescue.

After the first batteries had been in use for a gratifyingly long period and were ready to be sold to the junk dealer and replaced with new elements, they were not sold to the junk dealer. Instead, the plates were transferred to a set of glass battery jars conveniently placed in the factory, and were properly "burned up"—that is, the connections were made by fusing together the lead straps of the elements in the usual way. The two batteries were connected as one with the factory main wires, and suitable connections were made so that they could be charged while the plant was running during the day. The current so stored was utilized for electric lighting and running the elevator motor at night, in place of the supply company's current.

Inherent Qualities of Apparent Junk.

The plan is a complete success. While the batteries are of no use for vehicle work, they have sufficient capacity for the far less exacting service required of them as stationary batteries, and it is a rather curious fact that the old plates in their new positions are good for some 18 months' service. And after this—when the last possible week of service has been extracted from them—they are sold to the junk dealer at a price just as good as if they had been sold immediately on being removed from the truck, for the material the junk man is looking for—the lead—is undiminished in weight.

The expense of the stationary battery installation was by no means heavy, and the expense of maintenance is practically nothing, for the charging current, as already stated, costs so little as to be negligible, the used-up plates from the trucks are sufficient to keep the stationary battery in working order and the jars of course do not require renewing, except in the rare case of accidental breakage. Factory employes assemble and "burn up" the elements.

Old Plates in New Cells Save Expense.

The result, so far as the owner's pocket is concerned, is that the money saved in electric light bills is very nearly sufficient to pay for the periodical renewals of the plates in the truck batteries—a truly gratifying state of affairs. The plan is very far beyond the experimental stage, as it has been working for several years. It hardly is necessary to add that the proprietor of

Digitized by Google

that factory has the highest possible opinion of the advantages of electricity as a motive power.

Light Companies' Supply Prohibitive.

The same battery dealer told of a case that is somewhat analogous to the one described, in that it involves the use of current charged into a storage battery from a factory plant of such capacity that the amount of "juice" absorbed by the battery hardly can be traced on the books. The affair hinges on the fact that the proprietor of the establishment in question built himself a very fine residence at some distance from his place of business, and found that, owing to its somewhat isolated location, the electric light company refused to supply current unless the owner paid the expense of running the wires from the nearest available tapping point to his house. The expense involved was prohibitive, so the house was finished and wired, but the company's current was not carried to it.

Vehicle Battery Lights County House.

As in the other "story," the battery man came to the rescue. The owner of the house possessed two electric broughams, and one of these he used every day, rain or shine, in traveling to and from his factory. Arrived at the works, he would put the battery on charge, and by the time he was ready to go home it was "full up." And now comes the interesting part. Arrived at his garage, he would connect a plug from his vehicle battery to a receptacle in the garage wall; this receptacle is connected with the electric light wiring of the house, and, with 80-volt tungsten lamps in all the fixtures, there is plenty of current available for all the illumination that possibly can be required, with a wide margin for special occasions, such as Sundays and holidays, when no charging is done.

Some Figures About Consumption.

As a matter of fact, a little figuring shows that under ordinary domestic conditions the battery hardly would know that it was being drawn upon for overtime service. The popular size of tungsten lamp consumes 20 watts per hour. Twenty such lamps, burning simultaneously, consume, of course, 400 watts. Suppose, to go a little to extremes, there were fifty such lamps burning all at once—a total demand upon the battery of 1,000 watts. A vehicle battery having 11 plates per cell has a normal, easy discharge capacity of 30 amperes at about 80 volts, assuming that there are 40 cells, which amounts to 2,400 watts. This answers the question of the capacity of the battery for the work in an entirely satisfactory way. Shorn of all technicalities, the case presented is that of a man manufacturing electricity at his factory, carrying home a load of it by its own energy, and using it when he gets home to illuminate his house. This surely is wireless transmission of power, for there are no wires from the factory to the house, yet it is factory power that lights the house lamps.

Battery Solves Complex Conditions.

It is true that such plans as those described would not work in many instances; the conditions were somewhat out of the ordinary, and the plans had to be worked out to conform with the conditions. But this is exactly the point made by the live-wire battery dealer. He maintains that the storage battery is capable of rendering service that will fit conditions that are unusual, and, if the various phases of the matter are worked out properly, that it will render service with which no other source of energy can compete. It is up to the battery man to keep his weather eye open for conditions and combinations of conditions of which advantage can be taken to benefit the battery owner, which means, indirectly, that the entire electric vehicle industry is enriched by the addition of another enthusiast—and that the battery man has added a little more prospective butter to his future bread.

Bouncing as Test of Steel Balls.

Ingenious and instructive as are some of the methods of testing materials and products, it is doubtful if there is any more ingenious method than that employed by the manufacturers of several brands of balls used in ball bearings. The finished steel balls are permitted to drop from a predetermined height onto a polished and hardened steel plates. The height to which they bounce serves as an indication of their hardness and the amount of deflection of their path from the straight line indicates their sphericity.

Worn Brake Pins Source of Noise.

Wear on brakes is by no means confined to the friction surfaces of the bands and the drums. The pins and eyes also wear, and not infrequently exposure to dust is responsible for rapid cutting away of the bearing surfaces so that there is considerable play not only crosswise but endwise. A very considerable proportion of the noise and rattling of a car that has been in service for some time can be traced to loose brake mechanism, and in taking up such wear, or removing the worn parts, care should be taken to eliminate the endwise play of the eyes on the pins, as well as the play in other directions. Another source of noise lies in brake rods that touch the chassis.

Gauge to Suit all Shapes of Tanks.

Despite the large number of dash appliances which now are on the market intended to show the contents of the fuel tank at a glance, with any number of people the old idea of using a rule or even a stick to determine the quantity of gasolene in a tank is still adhered to. Taking advantage of this conservatism, the Goodnow Mfg. Co., Boston Mass., has recent placed on the market the measuring "stick" shown in the illustration, and which has the advantage over the ordinary rule in that, after first adjustment, the device is direct reading, no matter what shape or form of tank obtains. The device is handsomely finished in black stained hard wood, is made in two lengths, 15 inches for cars with tanks which have a capacity up to 20 gallons, and 24 inches for cars with tanks with capacities up to 30 gallons. On the face of the rule are provided adjustable brass sliders numbered consecutively from 1 to 20 or 30, as the case may be, and a larger brass pointer, which also is adjustable. The device is adjusted by filling the tank a gallon at a time and adjusting the pointers to correspond with the level of the liquid for each gallon introduced. Where rectangular sided tanks obtain, the sliders, obviously, will be evenly spaced, but where round or oval tanks are used or tanks of irregular form, such will not be the case. The pointer is used to mark the level of the fuel at any specific time.

Simple Method of Protecting Tires.

If a car is kept in a garage which has its floors always covered with oil and grease, it pays, especially if the car is in the garage a considerable part of the time, to let the tires rest on pieces of wood to protect them from the effects of the unguent stuff. The car can be stopped a foot or more back of its place, the boards put down in front of the wheels, the tires wiped clean and the car run up, all of which takes but a few minutes and is well worth while.

Handy Test for Viscosity of Oil.

A very rough-and-ready test of lubricating oils may be made by rubbing samples between the thumb and finger. The more "body" an oil possesses the longer it will withstand friction without allowing the thumb and finger to come into comparatively dry contact.

GARAGEMAN WHO KNOWS WHY PROFITS VANISH

Leader in New York Garage Trade Discloses Figures That Strikingly Illustrate Existing Conditions — Expenses High and Leaks Numerous — Some Which Have Been Stopped — Livery Stable Days Compared.

That the garage business is not a money making venture at the present time and that when money is made in such an establishment it generally is not as much as it should be in proportion to the investment, is the plaint of the garage trade in general. Just where the money goes—or fails to come from—is more or less known, although there are garagemen, and their name is legion, who know so little about the science of their business that the knowledge they do possess is not of the helpful sort.

Known Costs and Profits Valuable.

When, therefore, a man is found within the trade who can put his finger on every item of income and expense and show how much he gains or loses, his brothers in the business should be quick to study his figures. And such a man is William Burrows, secretary and general manager of the Niagara Livery & Motor Car Co., of 69-75 East 89th street, New York City, and Burrows, it may be added, also is vice-president of the New York Garage Association and president of the East Side Garage Association. He is a leader, not only in his district but in the city at large.

Burrows has his books gone over regularly by an auditor, who shows him how much he gains or loses and, figuring on a full capacity of 125 cars, the auditor tells him he can make $316 a month on his storage, yet because of the varying seasons of the year, the books for the combined months of July and August last show that Burrows lost exactly $1,171.41. This condition prevails in varying degree for the five months of the summer season. During the other seven months the books show a profit, but for the twelve months the profits and losses, Burrows states, about equalize each other, leaving the only profits of the business to be taken from the sale of gasolene and other supplies.

Stablemen Welcomed Automobile.

Burrows knows the garage business from the ground up; he and a partner used to run a livery stable, but four years ago turned it into a garage.

"We welcomed the automobile," said Burrows in relating his experience to a Motor World man. "We thought we could make $10,000 a year where we were making but $6,000 or $7,000 from the stable. The first year of the garage my partner was discouraged, the second year he was disgusted, and the third year he quit. Until the first of the present year the business had been making some money through the fact that we bought gasolene at nine cents and sold it at 20. But when it began to go up the profits on the business as a whole dwindled and disappeared entirely."

Garagemen Combined to Raise Rates.

By the month of March, when the price of gasolene had continued to rise, the 17 garagemen in the district bounded by 110th street, Fifth avenue, 8th street and the eastern edge of Manhattan Island determined to make an effort to save themselves. They formed the East Side Garage Association, with Burrows as its head Prices were increased about $5 a car for storage and gasolene was raised from 20 to 25 cents a gallon. A few owners protested, but when the matter was explained to them they submitted; in fact, there was nothing else they could do. One man who left when the rates were raised came back this week to arrange for storage again in the Burrows establishment.

Why Car Costs More Than Horse.

"That's one thing the owner doesn't understand," said Burrows. He doesn't see why we don't make money. Many of my customers used to keep their horses and carriages here. They said, 'Why is it, Burrows, that we used to store a horse for $35 and yet a car costs so much more?' They readily see it, however, once it is explained. Here's the reason: We used to charge $35 a month for one horse, $70 for a team, and every team was entitled to two wagons. Then we employed

1 washer at $15 a week, which is	$15
8 grooms at $12 a week, which is	96
1 floorman at $12 a week, which is	12
1 foreman at $25 a week, which is	25
Making a total of	$148

Also, our lights cost but $50, where they now cost $120; coal was but $65 a year then, and we now pay $125 a month; sponges and supplies cost but $100 a year, where we now pay $250 a month. And, more than that, the chauffeur of to-day does no work at all about the garage. In the stable days the stableman washed the carriage and the chamois rubbing and cleaning all was done by the coachman. Just to show you the difference, here is a table showing the help we now require. This is made up on the basis of full capacity—125 cars; the figures for the horses were based on 100 horses."

Mr. Burrows produced the following statement to substantiate what he said:

LABOR		
Night Gang—		
6 washers	$450	
12 polishers	624	
4 interior men	240	
1 elevator man	65	
1 foreman	110	
2 chamoisers	130	
Day Gang—		
1 elevator man	65	
6 floormen	300	
1 stock clerk	45	
		$2,029
GENERAL EXPENSE		
Garage supplies	250	
Light and power	250	
Coal	125	
Water taxes	50	
Telephone	75	
Repairs and alterations	50	
Postage	10	
Rent	875	
Office supplies	10	
Petty expense	20	
Miscellaneous	35	
		1,750
ADMINISTRATIVE		
Management (office, insurance, legal)	380	380
Interest on investment	150	150
Total operating expenses		$4,309
Total receipts, 125 cars at $37 per car		$4,625
Less operating expenses as above		4,309
Surplus, or profit		$316

"This table, compiled by our auditor, shows a profit of $316 a month with the garage full, and I believe it applies to any garage of this size, for the rent is bound to be about the same and the same number of men must be employed. Our monthly payroll is $2,029. Our rent is $10,000, but, of course, outside of New York City this item might be less.

Cutting the Telephone Expense.

"I am pleased with one big cut I made in expenses, and that was in telephone service. The owners knew nothing about conditions until the East Side Garage Association sent out letters stating that in the future two telephone calls a day would be allowed to each chauffeur, one call to be paid for by the owner and the other by the garage. Before that the chauffeurs had been making an average of four or five calls a day, all of which were charged up to us at five cents a call. Last year my telephone bill was

Digitized by Google

$1,500. The chauffeurs used to call the owner's residence two or three times; they would call his office once or twice, and they spent some time calling up their friends. When the letters went out some of the owners told the chauffeurs they would call them up when they needed the car and that the chauffeur was not to use the 'phone at all. Also I put in a telephone pay station in the garage, and my bill has been about cut in half. That means a saving of $750 a year.

Explaining the Storage Raises.

"We have the business where it is making a little money now, because of our raise in storage prices, and in the future we hope to get things on a more businesslike basis. Our past and present rates are:

	Before raise.	After raise.
Extra large, fore-door limousine. ..		$45
Limousine or landaulet.....	$35	40
Small town car, closed.....	30	35
Seven-passenger touring car.....	30	35
Five-passenger touring car.....	25	30
Large runabouts		30
Small runabouts	20	25

At the same time 'gas' went up from 20 to 25 cents a gallon.

"Under the old rate it was costing us an average of $32.50 a car, and we were getting an average of $30. That was a direct loss of $2.50 a car which, before the raise in 'gas,' we could make up on that item. We are making more on the storage, but we are making less on 'gas' than we used to. When it was nine cents and we sold at 20 we made 11 cents a gallon. Now that it costs us 16 cents and our price is 25, we are making but nine cents a gallon profit. This is a loss of two cents under the gasolene profit of a year ago. It sounds small, but using 450 gallons a day, as we do, it means a daily loss of $9, which amounts to $270 a month.

Plans for a Better Future.

"We have plans for the future but cannot put them into effect for some time. What we will do is to get everything on the basis it should be on. Instead of skimping along with a little profit or none at all on storage and drawing the life of the business out of gasolene, we will sell gasolene for a profit of five cents a gallon. At 16 cents it will be retailed for 21 cents, but storage will be raised to where it will pay, and then we can conduct a real business.

"One of the greatest contentions I find is in constantly trying to convince the public that I am not a crook. The owners have an idea that the garagemen, as a whole, are a bad lot, that they are hand in glove with the chauffeurs in grafting and are out to trim the public. That is disagreeable to me. So far I have enjoyed the name without the game, and I believe I can continue to do so. The owners must be educated to the cost of garage running. The more they see of the inside of it the less they are inclined to criticise. Take the several items that go into upkeep, for instance. For sponges, we pay $4.50 a pound, and our sponge bill is about $600 a season. These, with soap, polish, cloths and such things as are needed in keeping cars in shape, bring us a monthly bill of from $250 to $300. On this matter of figures I am not guessing. I have watched things and I know where the money goes. I have $30,000 invested here and am not making a profit that is large enough to be noticed. I think the old horse storage rates have something to do with the rates which have grown up with the garage business. When we started our garage we were glad to get cars at any reasonable price, and we did not know until the prices were pretty well established what a disastrous thing we had done for ourselves.

Municipal Legislation Expensive.

"Another thing that makes it hard is the municipal legislation. Last year I had to spend $300 for fire escapes; my electric equipment, which was approved two years ago, now has to be changed at a cost of $250; we had to put in a gasolene separator that cost from $500 to $700 and is absolutely worthless; we have to have a portable 'gas' tank on every floor—they cost $250—and then keep them outside the building, whereas cars, with thin fuel tanks, can stand in the building. I fail to see the sense in a lot of these regulations. The legislators seem never to think what their laws are going to cost us.

"Higher rates is all that will save the business. Rent keeps going up, and during the slack summer months, when little is coming in, the rent goes on just the same. Also, we have to provide for our employes in some way, working them alternate weeks or some other arrangement, and what profit we make now in the winter disappears in the summer. I make a living, but no profit."

Motor Cars Form Part of Texas Fair.

Housed in the machinery building, along with many other things calculated to render the farmer's daily chores less burdensome, some 19 different makes of motor cars were exhibited by fifteen dealers at the Texas State Fair at Dallas during the week of Saturday, October 12th, to Saturday, October 19th. While attractiveness was added to the display by virtue of the efforts of the various exhibitors, no definite decorative scheme was carried out, each booth being erected and made eye-pleasing by the occupant.

Among the exhibitors were: Moon Motor Car Co., Moon; Studebaker Corporation, Studebaker; Ford Motor Co., Ford; United States Motor Co., Maxwell; Abbott-Detroit Sales Co., Abbott-Detroit; Buick Automobile Co., Buick; Mitchell Motor Sales Co., Mitchell; Halff Motor Car Co., Pierce-Arrow, Chalmers, and Flanders electric; Munger Automobile Co., Cadillac; Hudson Motor Car Co., Hudson and Reo; Davis Turney Automobile Co., Stevens Duryea; Harold Abrams, Stearns; Sacksteder-Potter Co., American; Packard Motor Car Co., Packard; R. A. Cameron Auto Co., Oakland and Hupmobile.

Vulcanization That Roasts Tires.

Despite the comparative ease with which vulcanized repairs may be made on tires and tubes, there still remains a tendency to overdo the work, or, in other words, to roast rather than to repair the rubber. If too much heat is applied, the resiliency of the rubber will be impaired, if not destroyed entirely. It is a mistaken idea to assume that much heat applied for a short time will do the work of less heat applied for a much longer time. It should be remembered that vulcanization is a curing process that requires a certain amount of time in addition to the proper degree of heat and pressure.

Caution Needed with Fine Threads.

In view of the comparatively fine threads that frequently are used in screws, bolts and so forth, in motor car construction, it is well to bear in mind that less force is required to bring a fine-threaded nut or screw to a given pressure than if the thread is coarse, the diameters being equal. A fine thread is less easily jarred off. It is advisable to use considerable caution in tightening small bolts and screws with fine threads, because the leverage, so to speak, is so great that the threads may strip under too hard a pull on the wrench.

Handy Tool for Cleaning Contacts.

A very convenient little tool for keeping the platinum points of a vibrator, or other electrical contacts, in good shape consists of two strips of very fine emery cloth or paper glued to opposite sides of a piece of thin Bristol board. The glue should dry under pressure, so that the strips will be quite flat. This tool will dress both points at the same time and, with a little care, the surfaces will be left flat and parallel.

Lighting Cigar from Pet-Cock.

One of the "freak" methods of lighting a cigar when no matches are available is to open a pet-cock on a running motor and take a light from the burning gases as they shoot out of the cylinder. This will light the cigar—if it does not blow it to pieces first.

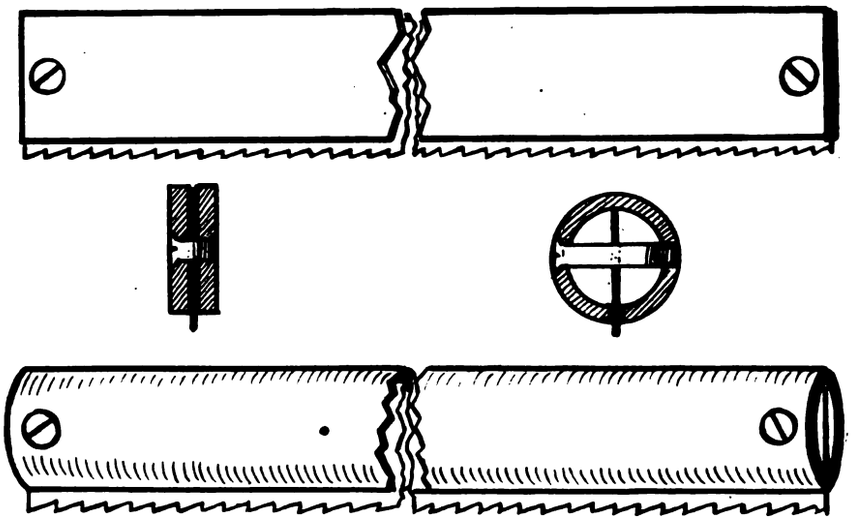
SPECIAL JOBS AND TOOLS FOR DOING THEM

Record System for Shop Puzzles That is Better than Memory—Appliances Intended for One Job Found Convenient for Many Others—Use of Hacksaws in Restricted Places.

There are certain jobs the repairman has to do that may be called more or less routine work, because they are of comparatively frequent occurrence, and little or no question arises as to how they are to be done; no special planning is necessary and there is no "problem" to solve. On the other hand, there are little jobs that are positive nuisances because, though they seem insignificant and are insignificant in a way—especially from the point of view of the owner of the car—they are not readily handled with ordinary tools and methods, and so much time is lost in evolving special methods and special appliances that the cost of doing the work is all out of proportion to what might be expected. Even the repairman himself cannot be sure that what looks like a simple little matter is not going to develop into something of a puzzle, even though long practice helps considerably in detecting the little signs that presage difficulties.



That Which Is Written Lives.

There are many little special tools and special ways of doing things that are worked out on the spur of the moment and practically forgotten as soon as the work which necessitated their devising is finished. If a similar job comes in before the first job has been forgotten and the special tools lost, all is more or less plain sailing; but if, as is too often the case, no one remembers how the thing was done, or if there has been a change in the personnel of the shop, as is by no means infrequent, someone has to solve the problem all over again, and there is a loss of time and trouble and money—to someone—that might very easily have been avoided.

Keep Tools Methodically.

Even in the smallest shop there should be some systematic way of keeping track of special tools and the way in which they were used and the jobs that called them into existence. The amount of time and trouble devoted to this way of laying up something for a rainy day is absolutely nothing in comparison to the saving it can effect even on a single job.

The old-time machinists and fitters were—and still are, where they are to be found—keen on possessing fine tool kits, and many of the tools are sure to be of special design, and possibly of no use except for some particular sort of a job. Nevertheless, their possession is well worth while, for when the demand comes the mechanic is prepared for it, and there is a certain sense of satisfaction in being all ready for an unusual piece of work without any preliminary fussing. But this is a one-man plan; it rarely is of benefit to the shop, as a whole, for most mechanics are decidedly jealous of their ideas and the fruits thereof, and keep their tools locked in their chests and their ideas in their heads, so to speak.

HACKSAW HOLDERS FOR USE IN RESTRICTED PLACES

From Apprentice to Foreman.

There is at least one man, however, whose narrow-gauge pride in his special tools broadened out when the scope of his work was broadened by his elevation to the foremanship of a motor car repair shop. He began as an apprentice in a railroad shop, worked into the "millwright gang," which had charge of all the machine tool setting and repairing, shafting work, power plant maintenance, and so forth—a position which brings with it an enormous variety of work of the unusual kind and makes a fine training for an all-round mechanic. For a first class millwright it was but a short step to the specialized work of the automobile repair shop, and in time the thorough mechanical ground work, added to experience and intelligent interest in automobile work, resulted in a foremanship that was well deserved.

Stealing Employer's Time.

One of the first acts of the new foreman, after he had become somewhat comfortably settled in his new seat, was to lay out a system for the making of special tools and the recording of special jobs. As every mechanic knows, it is usual for a man who wishes to make himself a tool to do the work a little at a time in stolen moments, so that, strictly speaking, the tool so made is the property of the man's employer—more especially as the material usually is acquired in the same way as the time. The new foreman gave instructions that when a special tool was required, it was to made as part of the job on which it was to be used and, after the job was finished, put away, tagged with a number of its own.

Haystacks No Place for Needles.

A record book was kept, and in it were entered details of solutions of mechanical puzzles, and where special tools had been made, their numbers were given; thus the possibility of a much-needed tool being buried in someone's tool chest, possibly the chest of a man no longer in the shop, was eliminated. Furthermore, the tools were within reach of any man who might need them, instead of being available only to a single man.

Digitized by Google

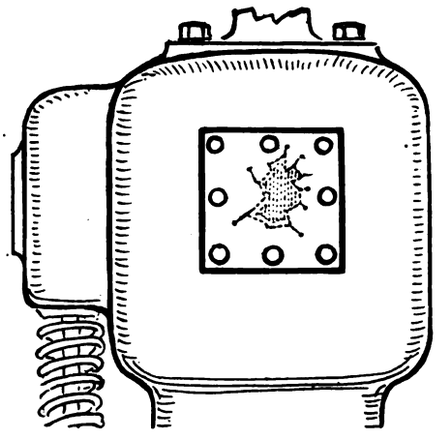
In a small shop this system would work just as well as in a large one, for three or four men can "lose" tools and forget things just as well, in proportion, as four times as many. Of course, there are not many of these problem jobs in a small establishment, and the task of keeping track of them and of the tools would be a very small matter; but the saving of time on a repair job would be more important, perhaps, than in a big shop, where the item would be so much smaller in proportion to the output of the place.

Occasion Arises for Ingenuity.

A special tool that was devised by the foreman in question—and, incidentally, may have been devised by many others—was a hack-saw frame which made it possible to use a hack-saw in places so restricted that the ordinary form could not be used at all. A decidedly unusual job was the father of the tool. An old motor, which had been out of service for several years, was sent in to be overhauled. The spark plug ports had been bored out, for some unknown reason, and bushed, the bushing having been purposely rusted in, apparently, with a solution of sal ammoniac or salt, for it resisted all efforts to unscrew it. The metal around the ports was much thinned by the re-boring for the bushings, and it was necessary to proceed with considerable caution; the motor was a light one, too.

Judicious Planning Labor Saver.

The usual method of procedure would be to file a slot through each bushing, cutting into the threads until the metal was so weakened that a light application of a hammer and cape chisel would break the remaining shreds and permit the bushing to be bent inward, toward the center of the hole, and so removed. A file is apt to make a pretty wide groove, however, and as there were none too many threads at best, it was desirable to damage them as little as possible. So the bushings were sawed with the tool shown in the accompanying illustration, which was made in a very short time, and proved to be thoroughly practical.



Home Made Hacksaw Frame.

The body of the tool was made of heavy steel tubing. Iron pipe could be used in the absence of the steel stock. The tube was of such diameter that the measurement from the inside wall to a diametrically opposite point on the outside wall was less than the width of the hack-saw blade by the depth of the thread in the outside of the bushing—the reason for which shortly will be made clear. As a matter of fact, the particular piece of tube used was a little too big in the diameter, so a trifle was filed off evenly along the whole length. The tube was split from end to end with a hack-saw, the cut being made carefully to keep it as straight as possible.

How the Tool Was Made.

Two holes were drilled, one at each end of the tube, passing through both walls; each hole—or perhaps it is better to say each pair of holes, as the drill passed through both walls—was tapped in one wall for a 3-16 machine screw and countersunk in the opposite wall for a flat head.

The distance between the holes was exactly the same as the distance between the holes in a hack-haw blade. The holes in a blade were enlarged to permit the fairly easy passage of a 3-16 machine screw. The tube was tapped lightly with a hammer in order to almost close up the saw slit. A fine-toothed hack-saw blade was inserted in the slit, with its back against the inside

SIMPLE WATER JACKET PATCH

wall, the two screws inserted, passing through the holes in the blades, and tightened down, nipping the blade firmly between the tube edges. The toothed edge of the blade projected a distance equal to the depth of the thread in the plug ports.

Emergency Idea Developed.

The tool thus constructed was used to cut slots down the sides of the bushings. It was impossible, of course, to cut too deeply, as the depth was fixed by the projecting blade teeth, and a thin cut could be made. So firmly were the bushings rusted in that it was necessary to make two cuts in each before they could be dislodged. Had the cuts been of any considerable width there would have been considerable opportunity for leakage past the new bushings that were inserted to take the new size of plug that was used. So nicely did the queer little saw work that several were made; in some, designed for use in small holes and other very restricted places, small tubes were used and the saw-blades were ground on the backs to make them sufficiently narrow. In all cases thick tubing was used to give sufficient depth for the threads of the machine screws. A set of holders was made up of flat strips, this method also being illustrated. Each holder consisted of two strips, drilled for machine screws, the blades being pinched between the strips. By making the holes in the different holders different distances from the edges different depths of cut were permitted; each holder provided for two depths, as the blade could be reversed, except where the holes were drilled directly in the middle.

The particular job in question was finished, after the old bushings were removed, by running a tap through the holes to clean out the threads and screwing in the new bushings with a good coating of smooth-on. The cement-like substance effectually prevented leakage through the thin saw-cuts made, and the bushings were firmly cemented in place.

Cylinder Patching Explained.

The same foreman once made a water jacket repair on a very light motor that was a beautiful piece of work of its kind. There was a jagged hole broken in the jacket, with a few short cracks radiating from the corners. The ends of the cracks were drilled with a small drill to prevent the spreading of the fissures, and a patch was put on with screws, which was an ordinary enough proceeding, except for the way in which the patch was bedded down. The curve of the patch was made to conform as closely as possible to the curve of the jacket. Then the patch was lightly smeared with red lead mixed with oil for "marking," and moved slightly while pressed hard on its seat.

Patch Made Good Fit.

The high spots, shown by the rubbing off of the marking on the patch and its transference to the jacket, were removed first with a second cut file, half-round, the flat side being used for the jacket and the round back for the patch. Continuing the process of alternatealy rubbing on marking and filing the high spots, the patch and the jacket began to show so many spots that it was difficult to get at them with the second cut file, so a smaller file, smooth cut, was used to still further bring the surfaces together. When the fine file reached its limit recourse was had to a scraper, and the surfaces were finally worked down to such a finish that there was no leakage when the patch was put on dry. A little red lead was applied before the patch was permanently screwed down.

Fine Work Costs Big Money.

As a matter of fact, this kind of workman-

Digitized by Google

ship is entirely unnecessary, and no owner would care to pay for it. In the case cited the work was done merely to show what was possible in the way of hand surfacing. But the principle involved is one that is applicable to all such patching, for the surfacing is the foundation of the job. There is no use trying to make a joint that will not leak when dry. A patch that is fitted closely enough so that there is no tendency to rock on two points, and which leaves no serious crevices for water to pass through, can be made perfectly tight by the application of some good cement, or of red lead, put on quite thickly and squeezed out when the patch is screwed down finally. Incidentally, it is more than likely that some of the cement will fall into the jacket through the hole, when the patch is screwed down; it should be removed by washing or, if the cylinder is small enough, it may be shaken out, before the motor is used. Otherwise there is danger of obstructing the pump or circulating system.

Cutting Thread Without a Tap.

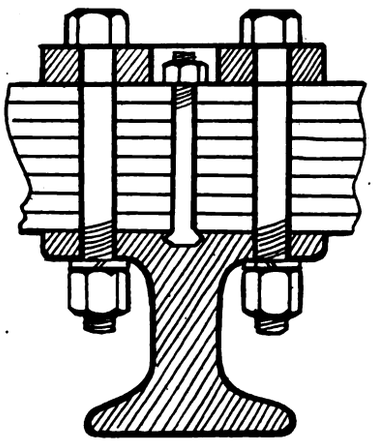
In an emergency a thread can be cut in soft metal, such as aluminum, with a screw similar to the one that is to be used. The screw should be tapered at the end so that it can be entered in the hole to be tapped, and grooved like a tap so that there will be some sort of a cutting edge. Such an improvised tap will not cut much of a thread, but often will make it possible to put in a screw that will hold for a time, especially if there is not much strain upon it.

Folding Rule as Drawing Tool.

A three-jointed folding rule can be used as a fairly accurate square of it is set in the form of a figure 4, a square applied to the two joints that are at right angles and the point of intersection carefully marked with a knife-point. By using the mark as a guide the rule can be set accurately enough for many purposes; if desired, other angles can be marked off in the same way.

Making Over Worn Out Wrenches.

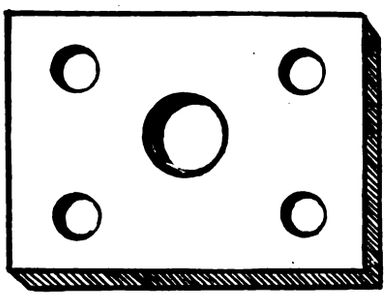
A solid wrench that has been worn or battered out of shape may be put into good condition by any blacksmith by re-forging the jaws, bringing them closer together and afterwards finishing them with a file. If the wrench was hardened this will, of course, soften it and re-tempering or re-case-hardening will be necessary.



Handy Reamer for Enlarging Holes.

An extremely convenient tool for rapidly enlarging small holes where accuracy is not required is a taper reamer, either square or pentagonal in cross-section, tempered to a dark straw color. It can be used either in a brace or with a T-handle of its own.

REPAIR OF SPRING CLIPS AS AN EMERGENCY JOB



Usually a Difficult Undertaking—Repairman's Ingenuity Makes It Possible—One Way of Solving the Problem.

When called out on a breakdown, repairmen have much greater opportunity of showing their skill than in the seclusion of their shops. When the automobile is taken to the shop, the job to be performed is either a known quantity or such tools and

SECTIONAL VIE WOF CLIP

materials are available as to make it comparatively simple to effect repairs. In the case of roadside repairs the conditions are different. The work is done under the vigilant eye of the car owner and perhaps some of his friends, and if they can be gotten out of a temporary embarrassment with dispatch, the story will be spread far and wide in their circle of friends, redounding greatly to the credit of the repairman and

ILLUSTRATING DRILLED PLATE

probably being the means of bringing him future business.

The repair of spring clips serves as a good example. It is almost a hopeless task for even the largest shop to carry in stock such clips for every type of car, as the forms and sizes of these are so numerous; therefore ingenuity frequently must be brought into play. The spring clips that attach the springs to the front axle are not primarily intended to be in the nature of safety valves, but they act in this capacity at times. Suppose, owing to a collision, any part of the front axle is struck; if the impact is great enough something must bend or break. If the axle is weak it probably will be the axle that will suffer; on the other hand, if the axle is robust and the clips are not, one of them may break and simply allow the axle to slide back without damaging it. Again, supposing that the axle is bent and the clip broken as well; by repairing the clip it often is possible to drive a few miles without danger, although at a slow pace.

It is an axiom for repairmen when they go out on repair jobs not to emulate the plumber who invariably arrives without tools, looks the ground over and goes back to the shop for whatever he needs and as often as he needs it. A breast drill does not occupy much room and always should be taken along, but it is of no use without a few of the more common sizes of twist drills. A small and a large rat-tail file can be used to increase the size of the hole after it has been drilled, in case the bolt has to fit the hole fairly snugly.

The accompanying illustrations show how a spring clip easily can be made on the road within an hour, the necessary material consisting of a piece of plate and four bolts and nuts. The spring perch on the axle will serve to mark off the plate and bolts can be made longer or shorter, as the case demands, by interposing washers or cutting with a hacksaw. This is another tool that the workman should always carry, as its multifarious uses make it invaluable in quick repairs.

Knock Due to Crack in Cylinder.

Although cracked cylinders usually manifest themselves in an unmistakable manner, attended by absolute failure to fire, a crack near the lower end close to the crankcase may be more difficult to locate, though its presence generally can be detected by an annoying knock which develops after the engine has been run for a short time. The knock may not be perceptible when the engine is cold, due to the fact that the crack then is closed tightly. But when the engine becomes heated the metal expands and opens the crack. The knock generally is caused by one of the piston rings catching in the crack.

Turning Broken Battery Jars to Account.

The hard rubber in storage battery jars is of excellent quality, and pieces from broken jars therefore are frequently of use in making repairs or doing work in which good, strong insulating material is needed.

In the RETAIL WORLD

G. T. Bradford of Rock Island, Ia., has become a dealer; he has the Rambler account.

A one-story garage, 40 x 100 feet, is to be built in East Orange, N. J., by Samuel Katz; the plans call for an expenditure of $6,000.

Harry Lipp is having plans drawn for a brick garage which he will erect on Bedford Park boulevard, New York City; he estimates the cost at $15,000.

George Crawford of Hagerstown, Md., and D. J. Forney of Gettysburg, Pa., have had plans drawn for a garage which they will erect in the latter town.

Permission has been granted to R. J. Dougherty, of Pittsburgh, Pa., to build a one-story garage and showroom on Grant boulevard; it will cost $6,000.

D. S. Parker and S. J. Culver have entered the selling field in Pomeroy, Ia., under the style Parker & Culver; they will sell Buick, Oakland and Krit cars.

Asire & Palmer, real estate agents in Marquette, Mich., have "gone into" automobiles; they have the Cadillac agency for Marquette and Alger counties.

The Public Garage, operated in Woodburn, Ore., by L. M. Remington, has been purchased by S. E. Brune & Son. The latter has the Michigan car agency.

Frank Kostlan of Marshalltown, Ia., has purchased the interests of his partner, J. C. Karkosh, in the Kostlan Auto Co. Kostlan will continue the business alone.

W. M. Chellis, Maine representative of the Franklin Automobile Co., has purchased a garage at 684 Congress street, Portland; a Franklin service station will be opened.

Mohr Bros., of Milwaukee, Wis., have had plans drawn for a garage, 60 x 102 feet, which will be erected at 32d street and North avenue; the estimated cost is $20,000.

Henry Alsopp, of Newark, N. J., is preparing to erect new brick showrooms and a garage, 116 x 84 feet, at Hudson street and Central avenue; he will expend $25,000.

A. B. Longacre has secured a site at Grant Boulevard and North Craig street, Pittsburgh, Pa., and will erect a garage, salesrooms and repair shop; the estimated cost is $10,000.

A six-story garage is to be erected on West End avenue, New York City, between 63d and 64th streets, by A. D. Russell of Princeton, N. J. It will represent an expenditure of $250,000.

J. C. Lewis, formerly in the automobile business with T. A. Bryson in Savannah, Ga., has branched out for himself; he has secured the Ford and Cole agencies and will handle accessories also.

Seccombe & Williams is the style of a new firm in Houghton, Mich., which is located at Shelden and Franklin streets. It will operate a garage and handle the Haynes, Locomobile and I. H. C. lines.

W. P. Kastner, accessory and tire dealer in Chicago, has leased for ten years a site at 2112 South Michigan avenue and will erect a building for his business; the site rental and new building involve $60,000.

The Ottawa (Ill.) Garage Co. has bought out the Clifton Garage. Ray Whittaker and Kirk Wyatt, who went to Ottawa from La Salle, Ill., last spring to open the garage, will locate a similar business in Chicago.

Permission has been granted to Thomas J. Northway, the Ford dealer in Rochester, N. Y., to build a three-story brick garage and salesrooms on Exchange street, north of his present location; it will cost $12,000.

Walter H. Koebel, formerly of Decatur, Ind., has entered the selling field in Indianapolis; he has the agency in that city for Cutting and Detroiter cars. Temporarily he will be located at 30 North Illinois street.

Automobile & Garage Co. is the style of a new enterprise formed in Yoakum, Tex., with $20,000 capital; the officers are: President, A. J. Ross; vice-president, F. S. Mason; treasurer, J. Lyons; secretary, D. J. Shall.

Co-operative Auto Co. is the style of a business just established by S. W. Wicks at 199 West 5th street, St. Paul, Minn. Garage, storage and repair work will constitute the present business; later an agency will be secured.

Harry Scott, formerly a chauffeur, has purchased the repair department of the Reid Auto Co. of Kalamazoo, Mich. Daniel Reid, the proprietor of the automobile company, will continue to sell Buicks and Oldsmobiles.

The Kentucky Automobile Co., of Louisville, state distributer of Cadillac cars, has contracted for a new service station and salesrooms in Lexington, in the same state. The new building, which will be completed about January 1, will be at Spring and Main streets.

Seward G. Andrews, for the past three years manager of the Detroit branch of the Swinehart Tire & Rubber Co., has resigned and will open a garage in Saginaw, Mich., under the style Andrews Auto Co. He will handle the Studebaker line.

S. R. Ide and Fred A. Watson, under the style Ide & Watson, have taken over the garage end of the Robert Willey Auto Co.'s business, at Charles avenue and Wealthy street, Grand Rapids, Mich. The Willey company will continue to handle Winton, R. C. H., Crow and Hupp-Yeats cars.

Thornton Chesleyn, an insurance man, and Fred L. Harvetcutter, for the past year manager of the Meeley tire store in Washington, D. C., have purchased the Washington branch of the Kelly-Springfield Tire Co., at 1730 14th street, northwest. They will continue the business in that location.

The Eller Motor Car Co. and the Halff Co., of Dallas, Tex., have combined; the former handled Pierce-Arrow cars, the latter Chalmers, Paige-Detroit and Flanders electrics. R. C. Eller, proprietor of the company which bore his name, will manage Pierce-Arrow sales for the Halff Co., which name the new business will bear.

The Northwestern Cole Motor Co., with H. P. Wood as president, has been organized in Minneapolis, Minn., as northwestern distributer of Cole cars; it succeeds the Haynes-Knutson Auto Co., which has given up business because of the ill health of John Knutson. The Haynes-Knutson location, 216 South 6th street, is retained.

The St. Louis Lozier Co., which, as its name indicates, will handle the Lozier line in St. Louis, Mo., has been formed with a capital of $25,000; its head is Henry B. Graham, who is president of the Graham Paper Co. and who was president of the now inactive Bagnell Automobile Co. Graham has associated with him as vice-president and general manager Nelson S. Gotshall, a Lozier factory man. The location is that formerly utilized by the Bagnell company, Graham, when Bagnel died recently, having bought up all outstanding interests in this concern.

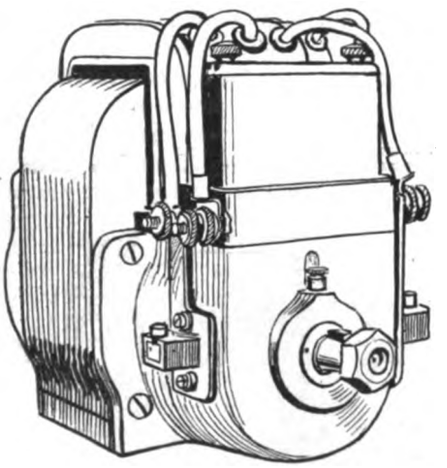
ILLUMINATING THE ELECTRIC LIGHTING SYSTEM

In Which Two More Installations Are Dissected, Their Characteristics Made Plain and Their Operation Explained—Wherein the Dealer Can Benefit Both the Owner and Manufacturer.

(This is the fifth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by dealer and owner alike.)



It is a fact peculiar to most businesses that the purchaser of an article almost invariably "looks up" to the dealer through which he purchased it to be set in the right path in the event that trouble of any kind develops. It may be that the manufacturer of the device, or apparatus, or whatever it may be, is more convenient to the purchaser than is the dealer, but even in that case it is a psychological fact that the purchaser prefers to do business with the dealer—provided he has been fairly treated in previous transactions, of course. As a rule, the dealer can get closer to his customers than can the manufacturer; he acts as a sort of buffer between the two and often can, by the exercise of his conciliatory powers, adjust slight difficulties or strained situations in a manner that makes friends for himself and also for the manufacturer.

How Knowledge Helps the Dealer.

So it is that the purchaser "looks up" to the dealer; the dealer has made a friend of him. And when the purchaser of a particular manufacturer's goods experiences some slight trouble, that may be the fault of any one of the three parties, his first recourse ought to be, and generally is, to the dealer who acted as the intermediary. But it is only when the dealer is well posted and knows his line from A to Z, that he can render the service which will make him friends and prove of mutual advantage. If he can tell his customer quickly and concisely just what is the trouble and can remedy it for him with the least loss of time and at the least expense, how much more friendly will be the feelings engendered in the breast of the customer! If, on the other hand, the dealer cannot make the required adjustment or repair for the simple reason that he is not completely familiar with the apparatus, or makes but a poor attempt which later develops to be seen in its true light, the situation which may have been strained before is in a fair way to deteriorate into a complete rupture.

Necessity for Proper Education.

All of which makes very plain the necessity for dealers to educate themselves into a thorough knowledge of their wares. And in this respect there are few subjects that are susceptible of greater study on the part of the dealer and which will return greater rewards in proportion to the amount of study given them, than the study of electric lighting and engine starting systems. Already several of them have been explained and their care and repair treated of in the four preceding articles that have appeared in Motor World. Several are treated in this article, and others will be treated in succeeding articles, and in each of them an effort has been made, or will be made, to place in the hands of the dealer and the owner such information regarding the different systems as will enable either to view them intelligently and such a way as will emphasize their real simplicity and the generally unknown ease with which adjustments and such minor repairs as become necessary can be made.

REMY LIGHTING GENERATOR

Compact Low Tension Generator.

Supplementing the ingenious and thoroughly practical Remy combination magneto-lighting generator that was described and illustrated in the last issue of Motor World, the Remy Electric Co. of Anderson, Ind., has just brought out a new lighting dynamo of the straight low tension type designed to be used for lighting alone, though, as has been explained in previous articles, it is perfectly feasible to employ any low tension generator for ignition purposes in conjunction with suitable induction coils and a distributor.

Laudable Reduction of Complexity.

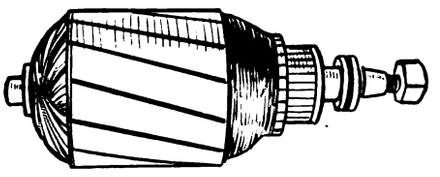
In the new generator, a palpable effort has been made to reduce to the minimum all complexity, and to this end the mechanical output regulator which forms part of the Remy magneto-dynamo equipment has been eliminated; its place is taken by purely electrical regulation, the principle of which long has been known and applied in various current generating machines with a great degree of success. The Remy system is designed to operate at 12 volts and the dynamo is differentially compound wound; it is positively driven, without the interposition of any clutching devices, at crankshaft speed. The armature, which is illustrated herewith, is of the slotted drum type and is wound with cotton covered enamel wire and afterward impregnated with Bakelite, which is an insulating compound which solidifies when cold—it is applied hot—and renders the winding practically solid and almost impossible of destruction under ordinary, or even extraordinary, conditions. By way of ensuring smoothness in operation and quietness, the armature slots are skewed or given a slight twist; the armature shaft turns in large ball bearings.

Little to Get Out of Order.

In the field, as in the commutator proper, there is little, if anything, that can possibly get out of order or adjustment and cause trouble, for there are no moving parts and everything is thoroughly protected. The field is of the two-pole type and is a steel casting to which the end plates and base are rigidly attached. The compound winding is located in a protective covering on the upper part of the field. By reason of the fact that the commutator is the portion which nominally requires the greatest attention, which at best amounts merely to casual inspection and occasional cleaning, the generator has been so designed that, regardless of its position, access to this part always is easy, and though it is thoroughly protected, no tools are necessary in getting at it.

There is no opening in the end plate at the commutator end; or, rather, there is an

Digitized by Google



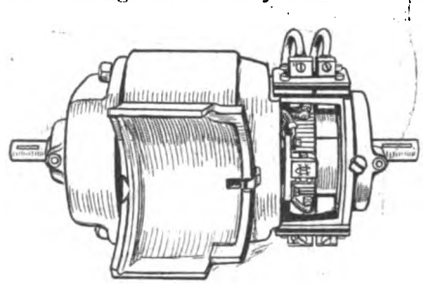
opening, but it is closed in an ingenious manner by locating the automatic cut-out—or, as it is styled in Remy parlance, the reverse current relay—over it. This reverse current relay is held in place by means of two wing nuts, the removal of which releases the device, uncovering the commutator inspection hole, and making possible cleaning or adjustment. Theoretically, commutators never should require to be touched; they should run indefinitely without attention until they become so worn that their replacement is necessary. In practice, however, attention is necessary, principally because of improper lubrication. Over-lubrication results in a gummy, sticky substance accumulating on the segments and poor commutation results. Under-lubrication, on the other hand, results in cutting of the segments, in which case excessive sparking occurs and cauess rapid deterioration of the brushes and the commutator.

Brownish Glaze is Necessary.

To be in the best of condition, a commutator should exhibit a glazed, brownish appearance and run without sparking. In order to obtain this condition, it is well occasionally to apply a minute quantity of the best quality vaseline of a small piece of felt, pressing the felt on the commutator while the armature is rotating. Only a very small quantity should be applied, however, and then only when the commutator appears very dry and exhibits symptoms of scratching or sparking. Oil should never be used, and great care should be taken to see that the bearing at the commutator end is neither flooded nor starved. If deep scratches develop, they may be removed by applying fine sandpaper while the commutator is running, or, in drastic cases, the armature may be removed, placed in a lathe and the commutator turned down an infinitesimal part of an inch.

Caring for the Brushes.

The brushes, of course, also will require occasional attention, and at periodic intervals should be removed and thoroughly cleaned of dust and oil deposits. Naturally, the brushes wear away slightly, and unless the dust which results is cleaned away it will get into the vitals of the machine and may cause trouble with the insulation. In not a few factories there is a growing tendency toward the use of graphite compound brushes, which are chosen by reason of their self-lubricating qualities. But while they are excellent devices when used advisedly and after provision has been made for their use by the manufacturer of the machine, they should not be substituted for carbon or copper mesh brushes except upon authority from the dynamo manufacturer. There are conditions under which they will not operate to the best advantage, and there is no one more able to dictate the particular kind of brushes than the manufacturer of the dynamo. In the Remy instrument the brushes are held in place by means of a couple of screws, though the construction is unusual in that the brushes may be removed merely by loosening the screws, which need not be taken out entirely, a feature which is advantageous where room is



REMY SKEWED ARMATURE

cramped. The brushes are made of carbon and should be replaced from time to time as they wear down through use.

Parts that Require Attention.

The only other portion of the Remy instrument which will require attention is the reverse current relay, which, as has been pointed out, is located in a casing over the commutator inspection hole. The function of this device is to connect the dynamo to the battery when the dynamo current is the stronger and to disconnect it when the battery current is the stronger. In form, it consists of an electro-magnet with two separate windings and a relay blade for mak-

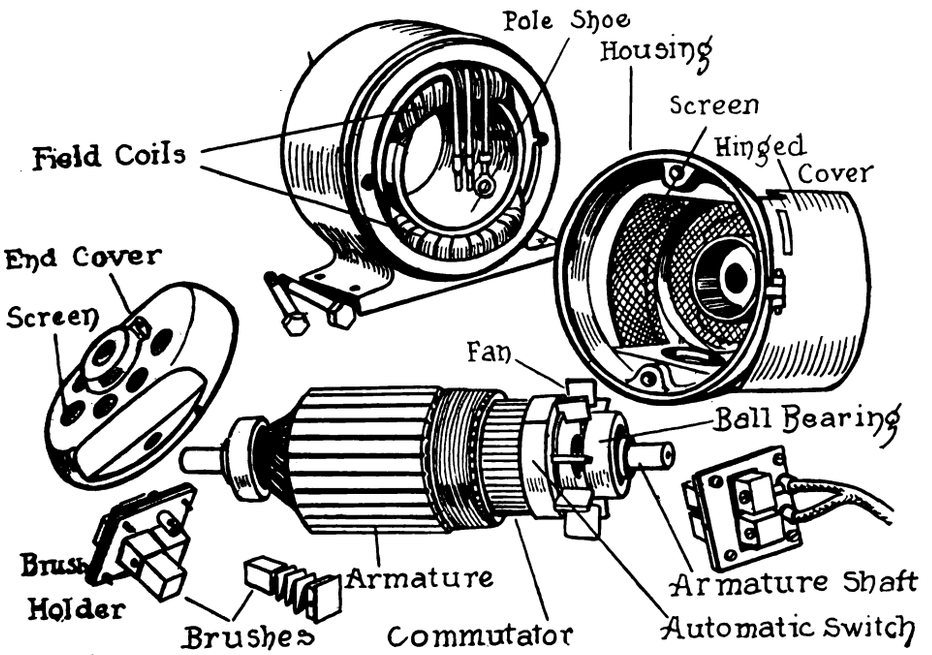
HOLTZER-CABOT DYNAMO

ing the contact. In operation, the relay blade is pulled down and connection made between the dynamo and the battery when the current from the dynamo becomes greater than the current from the battery. The dynamo then charges the battery as long as the dynamo armature speed is greater than 250 revolutions a minute. Immediately the speed drops below this point the current from the battery "backs up" through the relay, and in doing so causes the two windings to oppose each other, the result being that the contact blades drop, under the action of a spring, and the connection is broken.

Although this relay operates on an old and tried principle, and seldom, if ever, requires adjustment, it is well occasionally to inspect it and make sure that it is operating properly. The contacts in the relay blade should be kept clean and bright and about once in every six or eight months a single drop of very fine oil (preferably watch or typewriter oil) may be placed on the moving parts other than the contacts. Needless to say, no oil ever should be placed on the contacts. In the event of trouble the worst that could happen would be the sticking of the contact surfaces, due to dirty surfaces. Or the spring might through some unaccountable fault become broken, in which case connection between the battery and the dynamo would not be broken when the speed of the latter dropped below 250 revolutions per minute. In such an event, no harm could come to the system, owing to the fact that it is thoroughly protected by means of fuses.

How to Hunt for Trouble.

In the event of failure to generate, the fuses invariably should be examined first, for they are incorporated in the system for the specific purpose of indicating trouble and protecting the mechanism. Spare fuses are part of the equipment, and "blown out" ones should be replaced, though not until a thorough examination has been made to discover the cause of the failure. Generally, the location of the fuse that "blows" can be taken as an indication of the location and kind of trouble. If, after the fuse has been replaced, the dynamo still refuses to generate, all connections should be gone over carefully in search for broken wires or loosened binding screws, and as a last resort the brushes and commutator should be examined to make sure that the brushes make good contact and that their respective wires have not jarred loose. If all these things are right and proper and the dynamo still refuses to generate, that fact may be taken as an indication that the repair job is not one for the amateur, in which case a specialist, preferably a representative of the manufacturer should be called in.



Value of Clear Illustrations.

For a proper understanding of almost any piece of mechanism, it is advisable that, where possible, its component parts be examined in detail, for which reason the dynamo, which forms the heart of the Holtzer-Cabot electric lighting system, manufactured by the Holtzer-Cabot Electric Co. of Boston, Mass., is shown herewith, both completely disassembled and fully assembled. Incidentally, such illustrations, particularly in the case of electric lighting systems, make doubly plain the real simplicity of such mechanism and thus are valuable in dissipating the popular though erroneous idea that all, or nearly all, such systems are the incarnation of complexity and are not readily understandable.

Digitized by Google

When Compactness is Misleading.

In the illustrations of the Holtzer-Cabot dynamo are shown a simple, shunt-wound self-regulating generator, in which the compactness of the parts and their incorporation within a comparatively small and tight case might perhaps lead to the supposition of considerably greater complication than actually exists. That the machine is in reality simple, as are practically all other such machines, however, is revealed by the detail sketches of the parts. The field is composed of laminated iron and the windings are disposed in such a manner as to make them practically indestructible under ordinary conditions. The armature is comparatively heavy and is mountetd on a liberal sized shaft carried in ball bearings. At the commutator end of the shaft is mounted a simple and positive centrifugal cut-out switch for disconnecting the dynamo and the battery when the speed of the former drops below a predetermined limit, and a small fan, the purpose of which is to ensure that the temperature of the dynamo does not rise to dangerous limits.

HOLTZER-CABOT DYNAMO DISASSEMBLED SHOWING COMPONENT PARTS

Absence of Complicated Winding.

Indicative of the simplicity of the whole mechanism, there are no special windings or complicated regulating devices of any kind, current and voltage regulation being dependent entirely upon a fundamental electrical principle. Excessive current generation at high speed is obviated by extending the pole shoe tips in a distinctive manner, the result being that current is controlled by self-induction. Incidentally, this form of pole shoe also ensures high efficiency at low armature speeds.

With this dynamo, as with so many others in which regulation of output is a function of the generator itself, there are very few parts that are at all likely to get out of order or even to require attention. The commutator will require inspection from time to time, for which purpose the hinged cover on the top may be lifted, disclosing the brushes and brush holders, the centrifugal switch and the fan and the mechanism holding the brushes.

Dissassembly Made Easy.

If necessary, the brush rigging can be easily removed, permitting the withdrawal of the armature without the necessity for disturbing the connections. Needless to add, the armature should not be taken out except in the case of dire necessity, for though it is a simple matter to replace it and obtain proper adjustment, it is the wiser plan to "let well enough alone," secure in the knowledge that proper assembly has been made by the manufacturer and that it will stay proper under normal conditions as long as it is undisturbed.

The brushes are unusually liberal in size and should not require replacement for long periods. When they do require renewing their adjustment is simple, as is indicated by the accompanying sketch. Commutator care as made plain by the instruction given for other machines applies also in the case of the Holtzer-Cabot, though it can serve a good end rather than a bad one to reiterate the necessity for proper lubrication—not too much and not too little.

Duties of the Screen.

Another point which should be examined from time to time is the screen which partly closes the ends. Its purpose is to provide a means whereby air may be permitted to circulate through the machine without carrying dust and dirt with it. But if no air can get in, owing to the screen being clogged, it may be expected that the temperature of the dynamo will rise higher than was supposed by the manufacturer. From which it appears that the screen should be cleaned from time to time with the aid of a small brush with comparatively stiff bristles. Care should be taken, however, to see that accumulation of carbon dust from the brushes, and ordinary road dust, are brushed out of the machine and not into it.

Care of Automatic Switch.

The only other point which should receive periodic inspection is the automatic centrifugal switch located at the commutator end of the armature shaft. The duty of the switch, as already outlined, is to connect and disconnect the dynamo and the battery at a predetermined low armature speed in order to prevent the battery discharging itself through the dynamo when the engine is idle or running at very low speed; the Holtzer-Cabot dynamo is designed to operate at 1½ times crankshaft speed. As the switch is completely enclosed and cannot be gotten at short of disassembling the dynamo, which fact may be taken as an indication of its efficacy and the little attention it requires, it will be sufficient to make sure occasionally that it is performing its functions properly.

Tracing Generator Failure.

This may be determined easily by lighting several of the lamps and then stopping the engine. If the switch is operating properly there will be no dimming of the lamps, for they will be automatically thrown onto the storage battery. If, however, the switch should fail to operate, stoppage of the engine would occasion a dimming of the lamps, for part of the current then would pass back through the generator unless an interposed fuse burned out. In the latter case the dynamo then would fail to deliver current to the battery, which fact would be made plain by failure of the meter to register, if one were provided. If no meter were provided and other means had to be relied upon as an indication of trouble, the battery gradually would become exhausted and in this way make known the broken circuit.

Importance of Driving Gear.

Throughout the present series of articles dealing with the care and repair of electric lighting and engine starting systems, nothing has as yet been said regarding the method of driving the generator, though the subject manifestly is one to which great

Digitized by Google

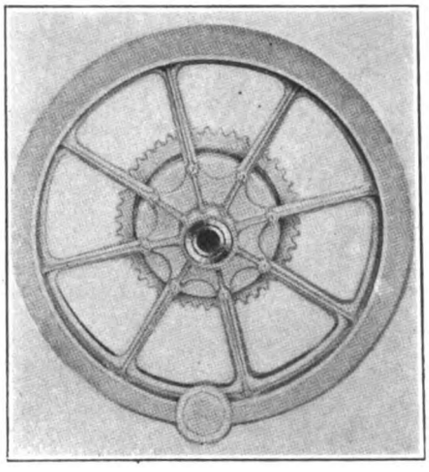
importance attaches. Generally, dynamos are driven through the intermediary of some form of gearing, either a belt or a chain or a train of gear wheels. The tendenscy, however, is toward direct drives and the elimination of all belts, chains, etc. Where a belt is employed, the V section undoubtedly is the best and is the one that is most generally used; flat belts, with the inevitable slippage that follows slight looseness, rarely are found in service of this character.

Silent Chains Should Not Run Dry.

Where chains are used, they are almost invariably of the "silent" variety, and mistakes often are made in assuming that this particular type of chain requires less lubrication than does the type long since made popular as a means to the propulsion of bicycles. But such is not the case, and the "silent" chain requires just as thorough lubrication as any other kind of chain used for transmission purposes. Lubrication of any kind never should be applied to belts, of course, though an occasional application of belt dressing, prepared for the purpose and obtainable of any belting house, will assist in preserving the leather and reducing the tendency to slippage.

Graphite Grease for Chains and Gears.

In applying lubricant to chains, care should be taken that sufficient is used, though an over supply will be thrown off by centrifugal force and will collect or cause accumulations of dust and dirt. The better way is to mix fairly thin grease and flake graphite to the consistency of a mediumly heavy paste and apply it sparingly to the inside of the chain teeth. Such lubricant will retain its lubricating qualities for long periods and will not be thrown off by chain whipping or centrifugal force. Where a train of gear wheels is employed to drive the dynamo the same lubricant advantageously may be used unless, as generally is the case, the gear wheels are enclosed in the crankcase, when the usual timing gear grease or the lubrication system of the engine will care for their needs.



Stitch In Time That Saves Repairs.

In nearly every case, the amount of adjustment or repairing required by the modern electrical lighting system is proportional to the amount of care given it, barring, of course, the unavoidable deterioration due to natural wear. But in those systems that already have been made plain, and in those that still are to be made plain, for it scarcely is possible to treat of all in the same article, the situation automatically resolves itself into a practical vindication of the old saw anent the efficacy of a single stitch taken in time.

SHELDON DEVELOPS STEEL WHEELS FOR COMMERCIALS

They Are of One-Piece Design and Can Be Bent and Straightened Without Harm—Stronger and Lighter Than Wood.

With the increased efficiency and reliability of power plants and transmission mechanism it is possible to keep motor trucks on the road a much greater proportion of the time than was the case some years ago; and at the same time load-carrying ability has gone up very considerably. These conditions have, of course, imposed correspondingly severe stresses on the road wheels, and only by the exercise of great care in the selection of material and the employment of improved manufacturing methods have wood wheels been kept abreast of the requirements of heavy haulage.

SHELDON STEEL REAR WHEEL

Steel wheels, which have been more or less extensively used for several years by truck manufacturers, are considered by some engineers as the solution of the heavy wheel problem, and among the concerns that have given the subject close attention is the Sheldon Axle Co., of Wilkes-Barre, Pa., widely known for its motor car axles, springs and other productions, which just has brought out a line of steel wheels, the general appearance of which is well shown in the accompanying illustrations. The absence of bolts and other fastenings is a prominent feature.

The wheel proper is of a single piece of steel, with the hub bored to receive the bearings and the rim turned to receive the tire band. By virtue of the annealing process which forms an important step in the manufacturing system, these wheels, after being so badly bent as to render them useless, can be straightened and put into good condition; the pressure required for such bending, however, is said to be much greater than a wood wheel of similar rated capacity is capable of withstanding without total collapse.

The great strength of the steel wheel is due, in large measure, to the fact that the metal can be distributed to the best advantage for the resistance of stresses, without the use of surplus material. Light ribs are formed along the spokes to withstand lateral stresses, and, as in practically all modern structures, there is considerable thickness of metal only in the directions of stresses. This, together with the absence of joints and fastenings, results in unexpectedly light construction. For instance, a set of steel wheels, 34 inches front and 38 inches rear diameter, with 4 inch solid tires, weighs 28 pounds less than a set of 36-inch wood wheels with tires of similar size.

Notwithstanding its great resistance to deformity, great resiliency is claimed for the properly made steel wheel, and as a result thereof, tire life is said to be augmented to an extent that expresses itself in dollars and cents.

How to Prevent Gas Tank Slipping.

Of the very many "little things" on a car that can become disarranged, with consequent annoyance to the driver, none is more aggravating than an acetylene gas tank which has worked loose in the holder and turned around, with a consequent presence of moisture in the gas line. While the liquid does no more serious harm than to prevent the lighting of the lamps until the pipes have been drained, the annoyance could be spared if lock nuts or lock washers were applied beneath the wing nuts on the retaining straps.

Split Nut for Protecting Threads.

A bolt or other threaded part that requires to be gripped in a vise, but cannot be held without danger of marring the threads, can be clamped as firmly as may be desired by sawing through one side of a nut of the proper size, screwing the nut on the bolt and clamping the nut in the vise, with the split either on top or underneath. The split will allow the nut to close on the threads and hold firmly without doing any harm. Even the use of soft metal clamps is inferior to this method.

Empty Cans as Hub Cap Substitutes.

A small empty tin can, wired on, is a curious sort of substitute that has been used for a lost hub-cap; but it is a substitute that has been used and certainly is better than nothing, to protect the bearings from dust and mud.

FRAMES AS A FERTILE FIELD FOR IMPROVEMENT

Wherein the "Designing Engineer" Suggests Some Not Wholly New Though Undeveloped Ideas That Might be Put in Practice—Motors Suspended on Springs and Foreshortened Chassis Discussed.

It was getting along toward six o'clock on Monday afternoon, and things were very quiet in the designing engineer's office. The last of the draughtsmen to cover up his board was washing the pencil grime off his hands, and the designing engineer was trying to make up his mind whether to put on his hat and go home or stay and do a little extra work in the quiet of the evening. Somehow the D. E. believed that electric light and silence were conducive to clear thought, and he had a habit of putting his beliefs into practice.

Draftsman Does Some Thinking.

He was still undecidedly twiddling with his papers when Kiefer, the draughtsman, presented himself before the desk with an expression on his face that, to quote the D. E., was "the shape of a question mark." Carrying out the dumb show, the D. E. looked up with an expression that said as plainly as words, "Well, go ahead with your question," which Kiefer proceeded to do without delay.

"I've just been doing a little wondering," he said, "and now I wonder if you ever wondered the same thing."

"Give it up," retorted the D. E. "Let's have the harrowing details."

Do Cars Possess Too Much Framework.

"Well, it may sound foolish, but I have just been wondering why a car needs so much framework. It seems to me there's a good deal more than is really necessary, and there ought to be some way of getting rid of some of it."

"That's not so foolish," replied the D. E. "Other people have wondered the same thing."

"I was just sort of looking over that car out there with the body raised half off the chassis," pursued Kiefer, "and it seemed to me that the whole machine is a collection of frames of one sort and another. First, there's the main frame of the chassis. Then there's a sub-frame for the engine, and the rear axle is in a sort of frame of its own, and it's connected to the main frame by rods that come pretty near forming another frame. On top of it all the body has a separate frame too. Now I may be talking impracticable rot, but I can't help thinking that there ought to be some way of combining some of this bunch of trestle-work which would make the car lighter and cheaper, and maybe stronger, too."

Bigotry Often Stifles Ingenuity.

"Not a bad idea at all," said the D. E. "You're not the first man to think of it, though. I never delved into it very deeply, but I have run across odd bits of information and suggestions and designs in the trade papers at different times, and I have an idea of my own that a good deal could be done to improve the conventional type of car by changing the frame arrangements."

"As long as we're both interested in the same idea, go ahead and open your heart. I won't tell the board of directors."

The D. E. laughed, for it was a standing joke that the "powers" of the company were intensely jealous of the design of their car, and were inclined to resent suggestions from anyone who could not add a string of initials to the end of his signature. More than one well-meant criticism had gone down the wrong way, and everyone who was "in the know" thought at least twice before intimating that such a thing as an improvement in the car was possible.

Radical Ideas Might Be Tried.

"You're sworn to secrecy" he said. "Well, in the first place, if I were free to experiment with radical designs I would see if I couldn't work out a machine with the body frame made of steel, strong enough so that a chassis frame would not be required at all. This might be done by making the sills of channel steel, perhaps, and they would not need to be so very heavy, because the rest of the body could be stiffened and strengthened to add to the strength of the whole."

"That's about the way it occurred to me, though in a hazy sort of way," put in Kiefer. "But when I listen to you I can think of things that didn't occur when I was listening to myself."

"What, for instance?"

Would Mount the Motor On Springs.

"What'll you do with your engine and gearcase? Hang them on the body direct?"

"No, sir. I would make use of quite an ancient scheme. Make the torsion tube that encases the propeller shaft very big and strong, and run it up to meet the gearcase, which would be the rear end of the unit power plant. This would give you the whole power plant and the driving mechanism in a single rigid unit from one end to the other, and there wouldn't be any universal joints or telescoping joints or anything of the sort. Then I would suspend the engine in the usual place, under the hood, putting it on a set of springs of its own, so that motor vibrations would not be transmitted direct, but would have to pass through the springs first. Goodness knows, a decent engine these days doesn't shake up a car very much, and with those extra springs the thing ought to run like velvet."

Solution Lies in Driving Connection.

"How would you make the driving connection between your big power unit and your body? There's no frame—I don't see just how you'd do it."

"You're a nice fellow! Here I'm working overtime enlarging on your foggy notions, and you're sitting there picking holes in my work. Well, I haven't exactly decided. There are several ways it could be done. I might make the connection at the front end of the engine, through auxiliary springs, or I might drive through radius rods from the rear axle to the body or, again, I might drive through the rear springs. I'm inclined to think, though, that the radius rod arrangement would be the best; it seems to me it would hold things in line better than any other method. I haven't really gone into the details in my own mind, and, so far as that goes, I would rather do a little experimenting first and make suggestions afterwards. It's the safest way. But I think there's a whole lot that really is sound and practical in the general idea."

"It's a wonder someone has not done it already," remarked Kiefer.

Ideas Appear New But Are Ancient.

"Someone has done at least part of it. A good many years ago there was a car that embodied the unit power and driving mechanism just about as I have described it, and the machine certainly seemed to be

Digitized by Google

all right. But for some reason the car did not make a mark on the market, and simply dropped out of sight. But have you ever noticed that every once in a while some concern brings out an idea that was abandoned years ago, and makes a success of it despite that fact? I suppose it's because engineering ability at first was not equal to the task of bringing out the best, so that it was not a commercial success, despite the fact that the principle may have been entirely correct.

"As our old professor of chemistry used to say when he didn't get the results he expected after a lot of preparation for a demonstration, 'The experiment fails—yes, yes; but the principle remains the same.' Someone may have failed to make the idea work years ago, but that's no reason why it shouldn't work—and by that I mean in a manner that will be satisfactory from a commercial point of view—now that it is possible to do such magnificent mechanical work and that the problems of motor car construction are so much better comprehended than they used to be.

Narrower Motor's Effect on Body Design.

"There's another thing that I have 'wondered about,' as you are pleased to put it," pursued the D. E. "A motor isn't a very wide piece of machinery, and if necessary it could be made still narrower. It seems to me that if the engine were made narrower on top and brought back into a narrow little hood, extending through the dashboard, the whole body could be moved forward on the wheels so that the tonneau, which is the most uncomfortable part of the car, so far as riding qualities are concerned, would be well ahead of the rear wheels and would be somewhere near as comfortable as the front seat. The total length of the car would not be increased, and the space taken up by the motor would be between the feet of the occupants of the front seats; I don't mean that the hood should reach clear back to the front seat. With a low, narrow topped motor and a fairly wide body, I don't see why that shouldn't work out pretty well. For another thing, the driver could easily cast his eye on his motor while running by lifting the cover over it."

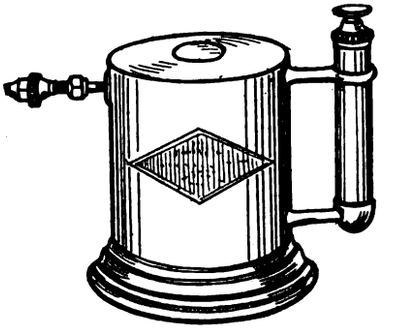
Plagiarism Sometimes Has Its Merits.

"How much of all this is new?" asked Kiefer.

"None of it. That is, the ideas all have been either put into practical shape or else have been suggested and talked over so all I can claim is that I never heard of a car that combined them—though for all I know there may be such a machine. And I'd like to bet you about thirteen cents that it's a good car, if it exists."

"I won't take you up on that, but," reaching for his hat, "I have very often observed——"

"Have you?" interrupted the D. E., doing likewise. "Well, let's go out now and take an observation. I feel the need of it."



Brass Drifts for Ball Bearings.

Brass being softer than steel, its use as a drift cannot be overestimated. Despite the fact, it is not an uncommon occurrence to see a man "paying" a ball bearing with a steel punch the tip of which has been tempered. Of necessity, ball bearings must be a tight fit, and it is often imperative to drive them off the shaft or out of their housing. In doing so, however, great care must be exercised to deliver the blows alternately first at one point and next at the diametrically opposite spot, in order to dislodge the bearing equally and prevent cramping. The outer and inner races of ball bearings are very hard and rather brittle; therefore, unless a soft metal is used as a drift, cracked raceways may result. The tip of the drift should be cleaned from time to time, as the peining effect causes a spreading of the metal and will result in small particles of brass flying off, and these may find their way into the bearing with attendant damage.

Facilitates the Cleaning of Motors.

Cleaning the exterior of a motor is a job that no repairman particularly fancies; it is troublesome and time-taking, if done in the ordinary way, and at best it is difficult to get all nooks and crannies thoroughly cleared of the oil and dirt they are so capable of accumulating. It is to overcome this trouble that the Turner Brass Works, of Sycamore, Ill., has brought out the Turner motor washer, a device that bears a strong resemblance to the familiar gasolene blow-torch and works on the same principle, though no flame or fire is used as a matter of course.

The accompanying illustration shows the form of the "washer." The tank, which contains a quart of gasolene, is of solid drawn brass with the bottom brazed in; a small but effective air pump forms a handle, and on the opposite side is a nozzle, which can be adjusted to throw either a spray or a very fine, penetrating stream. In use the cleaner is partly filled with gasolene and air pressure pumped up; the spray or jet from the nozzle is directed against

TURNER MOTOR CLEANER

the motor to be washed, and, of course, can be projected into the smallest crannies. The combination of the oil-cutting action of the liquid with its forcible projection does the work quickly and effectively, and a quart of gasolene is said to be sufficient to clean an ordinary motor.

It should be borne in mind that in using an apparatus of this character the proper place to work is outdoors, so that the inflammable vapor will dissipate harmlessly, and also to avoid the inquisitiveness of the ubiquitous insurance inspector.

Rope and Jack to Remove Wheels.

In case a wheel has to be removed on the road or when a puller of suitable size is not handy, an ordinary screw jack and a piece of rope or a length of chain will answer the purpose. The force that can be exerted by a screw jack is not often considered, but as the force is applied very gradually the tightest wheel may be removed if the hitching is correctly done and the final resistance overcome by a well directed blow with a hammer after a piece of wood has been interposed between the jack and the hammer head. This will dampen the blow and prevent any damage being done to the jack. If possible, a piece of hard wood should be used, so as not to minimize the blow too greatly.

Cleaning Terminals to Help Voltage.

While the subject of clean terminals for electrical connections is a very old one, it is of interest to know that tests made on a large electric truck showed that the thorough cleaning of connections which had been neglected for several months made a difference of about 6 volts at the meter with the battery half discharged. This is quite sufficient to make it well worth while to keep the contacts of an electric vehicle perfectly clean, and indicates that there is something more than mere theory behind the advice to do so.

Using a File on Sheet Metal.

There is only way sheet metal can be filed with comfort and effectiveness, and that is by moving the file along the edge instead of across it. In filing across a sheet, most of the energy applied goes to make a horrible noise. This does not apply to small pieces that can be held in a vise with the edge close to the jaws, so that the metal has no chance to vibrate.

FIFTEEN ENTRANTS START IN CHICAGO RELIABILITY

Around Lake Michigan Tour Launched Despite Heavy Rains—But Six Clean Scores at End of Second Day.

Even had the annual fall reliability tour of the Chicago Motor Club, which left the Illinois city Monday morning last, 21st inst., led through instead of around Lake Michigan, the route could not have been much "wetter." For a heavy downpour which commenced on the eve of the start of the tour and continued unabated throughout the first day's run of 170 miles to Oshkosh, Wis., made the none-too-good roads appear as if the lake had overrun its boundaries and encroached on the surrounding country.

Despite the weather, and despite also the numerous reports which came from the towns along the northern border of the lake to the effect that cold weather even unto the freezing point prevailed, 15 contestants left the Windy City on the lake-circling tour. Mud and water, however, did not serve to deter the tourists, and all save one of the 15 checked in at the night control without having incurred penalty. The solitary sufferer was R. B. Gray, who drove a National equipped with spring wheels and who was delayed for hours at Milwaukee with a broken hub cap.

The second day's run carried the tourists as far as Escanaba, 176 miles from Oshkosh. Continued rain made the road conditions even worse, if such could be the case, than on the previous day. But six contenders reached the night control with clean slates, J. Hanson (Case), A. M. Robbins (Abbott-Detroit), J. Monckmeier (Staver), and B. Park (R. C. H.) in the touring car class, and J. A. Wicke (Moline) and F. G. Salisbury (Moline) in the roadster division. R. B. Gray (National) dropped out, as did M. Barry (R. C. H.) who was detained for hours with motor trouble. A. Monson received 161 black marks for road work and tardiness at the control, and John Brolley (Velie) and E. T. Knudson (Staver) received 2 and 8 demerits respectively for adjusting carburetters. R. E. Maypole and Claude Anderson, who piloted Stutz cars, did not check in at the night control.

Before the contenders return to Chicago on Sunday evening next, they will have completed a soul-trying circuit 1,069 miles in extent, embracing, besides Oshkosh and Escanaba as night controls, Newberry, Mackinaw City, Traverse City and Grand Rapids.

The contenders who left Chicago were: In the touring car class, John Brolley (Velie), J. Hanson (Case), E. D. Knudson (Satver), G. Monckmeier (Staver), Adolph Monson (Bergdoll), A. M. Robbins (Abbott-Detroit), B. Park (R. C. H.), R. B. Gray (National); in the roadster class, H. M. Luce (Velie), R. E. Maypole (Stutz), Tom Roney (Bergdoll), J. A. Wicke (Moline), F. G. Salisbury (Moline), Claude Anderson (Stutz), M. Barney (R. C. H.).

Drizzle Shortens Rockingham Meet.

A drizzling rain which commenced ere half of the program had been run off and rendered the track so slippery as to be dangerous, necessitated a cancellation of the remaining events which were to have been run on the Rockingham Park track, Salem, Mass., on Saturday last, 19th inst. As it was, but two or the automobile events which were sandwiched in between motorcycle contests were reached. They were a five mile amateur contest for cars with displacements of under 300 inches and a ten-mile contest for cars of the same size, and were won by C. Oliver Iselin, Jr. (Mercer), in 5:50, and Daniel Higgins (Studebaker 30) in 13:15, respectively. The summary:

Five miles, for cars with displacements of under 300 inches, amateur drivers—Won by C. Oliver Irelin, Jr. (Mercer); second, H. Cutting (Mercer); third, S. S. Bigelow (Buick). Time, 5:50.

Ten miles, for cars with displacements of under 300 inches—Won by Daniel Higgins (Studebaker 30); second, J. Pew (Penn); third, Compton Smith (Hudson). Time, 13:15.

Narbeth Meet Ends With Darkness.

Darkness, which so interfered with his driving that Harry Ringler (Mercer) went through the fence after completing 48 miles in a 50-mile event, cut short the racemeet which was run on Saturday last, 19th inst., on the Belmont track at Narbeth, Pa. The three numbers on the program which were completed went to G. Bergdoll (Bergdoll), who completed five miles in 5:49; Freitag (Mercer), who went a like distance in 5:04⅗, and Menker (Kline), who went 10 miles in 10:02⅗. The 50-mile event was called off after Ringler's mishap, through which, happily, he passed unscathed, with Blocksom (Stutz) in the leading position. The summary:

Five miles, match race—Won by G. Bergdoll (Bergdoll); second, S. C. Briscoe (Regal). Time, 5:49.

Five miles, match race—Won by Freitag (Mercer); second, H. Ringler (Kline). Time, 5:04⅗.

Ten miles, for cars with displacements of 301-450 inches—Won by J. Menker (Kline); second, Freitag (Mercer); third, Blocksum (Stutz). Time, 12:02⅗.

"LITTLE GLIDDEN" TOUR LITTLE IN REALITY, TOO

Only Five Cars in Line and Only One Clean Slate—And This Despite Good Weather and Good Roads Over Entire 570 Miles.

If a name really counts for anything, the title "Little Glidden," which attached to the reliability tour of the Iowa State Automobile Association, which started from Des Moines on Tuesday, October 15th, and finished at the same place on Saturday last, 19th inst., certainly was befitting. The "littleness" of the tour was evidenced by the fewness of the entrants, there being just five contenders, including the pilot, in line.

Of the five, R. O. Gresham, who piloted the Warren entry, made the best showing and was the only participant to finish with a clean slate, by virtue of which performance he took the cup for the best score in the touring car class. Vere Reynolds, in a Chalmers, who finished with two points against him for tardiness at a night control, and A. E. Gounan (Chalmers), who was delayed by a broken spring, which cost him 10 demerits, also were entered in the touring car class. But two were entered in the roadster class—Dr. R. W. Soper (Ford) and Bruce Malcolm (Paige-Detroit)—and as both finished with penalties amounting to two points, the prize winner has not as yet been announced.

The route, 570 miles in extent, led from Des Moines to Council Bluffs, 120 miles; from Council Bluffs to Sioux City, 100 miles; from Sioux City to Ft. Dodge, 120 miles; from Ft. Dodge to Cedar Rapids, 130 miles, and back to Des Moines—another century. Good weather, and roads which, although not at all times 100 per cent. smooth, were in very fair condition, are accountable for the few penalties which were incurred.

Rain Causes Postponement at Hartford.

A steady downpour, which rendered the track too slippery for the contenders to negotiate at high speed with safety, caused the postponement of the E. W. Powell meet, which was to have been run off on the Charter Oak Park track, Hartford, Conn., Saturday last, October 19. Weather permitting ,the race will be run on 26th inst.

The Automobile Club of Middletown has been formed in the Ohio town of that name. The officers are: President, J. M. Iseinger; vice-president, W. C. Crane; secretary, C. E. Seabald; treasurer, Gay Biers. The board of directors comprises D. E. Haunan, G. D. Lemmis, Howard Wilson.

WISHART THE HONOR MAN AT BRIGHTON BEACH MEET

Mercer Pilot Takes Three Out of Eight Events on Well Managed Program—Not Even Dust Mars Sport.

Although disqualification, which resulted from the piston displacement of his Mercer being slightly greater than the limit of the class in which he was entered, robbed Spencer Wishart of one of his easily earned victories on the Brighton Beach track, Saturday last, 19th inst., his fast driving, which netted him two victories, was one of the features of the day.

Although the weather was threatening throughout the day and, indeed, several slight sprinklings did occur in the morning, the exceptionally interesting program which was advertised was sufficient to draw a good assemblage. And so well managed was the meet, and such good condition the track, that enthusiasm ran high among the more than 6,000 spectators, and the last announcement of the day carried the news of a similar meet to be run on Election Day, Tuesday, November 5th, under the same management—that of the Motor Dealers' Exhibit Co.

Wishart's victories included a five-mile event for cars with displacements of under 601 inches, the prize for which was the 20-Mule Team Borax trophy. Four started in the event—Mulford (Mason), Howard (Buick), Whalen (National) and Wishart (Mercer). Howard led off at a terrific pace, closely followed by Whalen. When coming around the bend into the home-stretch, Howard attempted to round the curve at too high speed and his mount skidded clear around and started in the opposite direction toward Whalen in the National. Whalen's adroitness saved the situation, however, and the National left the track and brought up in the field minus a rear shoe. Wishart took the lead, with Mulford in second place, and finished in 4:46.26. Both Whalen and Howard started again when the cars were put in condition, although the race practically was over.

Wishart's second victory brought him the Warner trophy. The contest was a free-for-all handicap, which went for ten miles with ten starters, and was one of the feature numbers on the eight-event program. The Mercer pilot had a 25-second handicap, but managed to lead home Ferguson (Mercer), who had 45 seconds, and Lewis (Stutz), who started from scratch. The time was 9:44.85.

Wishart also managed to beat the field in a Class C event for cars with displacements of 231-300 inches, but was disqualified, Ferguson being declared the winner. Ferguson's time was 9:41.87.

Dave Lewis (Stutz) likewise accounted for two events, a Class C ten-mile contest, for cars with displacements of 301-450 inches, which he completed in 9:32.50, takiny the Poertner trophy, and a five-mile free-for-all handicap, in which he started from scratch and won in 4:27.50 from a field of 12. Ferguson took, besides the Class C event which Wishart lost by disqualification, a five-mile invitation race, which he completed in 4:56.85.

The longest contest on the program went to Neil Whalen, who completed 25 miles in 24:52.85 and won the George Robertson trophy. Ferguson took second position in the contest and Lewis third. Six lined up for the start. Mort Roberts (Mason) won the Class C event for cars with displacements of 231-300 inches, completing the five miles in 5:18.55. An exhibition mile driven by Mulford in the National in 53.30 seconds and another by Bragg in a Fiat, but which was not timed, marked the close of the program. The summary:

Five miles, for cars with displacements of under 231 inches—Won by Mort Roberts (Mason); second, William Chandler (Studebaker 30); third, Ernest Meyer (Hupmobile). Time, 5:18.55.

Ten miles, for cars with displacements of 231-300 inches—Won by Armour Ferguson (Mercer); second, Gene Homan (Bergdoll); third, Mort Roberts (Mason). Time, 9:41.87.

Ten miles, for cars with displacements of 301-450 inches—Won by Dave Lewis (Stutz); second, P. G. Thebaud, Jr. (G. J. G.). Time, 9:32.50.

Five miles, for cars with displacements of under 601 inches—Won by Spencer Wishart (Mercer); second, Mort Roberts (Mason); third, Neil Whalen (National). Time, 4:46.25.

One mile, time trial—Ralph Mulford (National). Time, 53:30.

Twenty-five miles, free-for-all—Won by Neil Whalen (National); second, Armour Ferguson (Mercer); third, Dave Lewis (Stutz). Time, 24:52.85.

Five miles, special invitation—Won by Armour Ferguson (Mercer); second, Spencer Wishart (Mercer); third, L. Mitchell (Mercer). Time, 4:56.85.

Five miles, free-for-all handicap—Won by Dave Lewis (Stutz), scratch; second, Gene Homan (Bergdoll), 20 seconds; third, Neil Whalen (National), 2 seconds. Time, 4:27.50.

Ten miles, free-for-all handicap—Won by Spencer Wishart (Mercer), 25 seconds; second, Armour Ferguson (Mercer), 45 seconds; third, Dave Lewis (Stutz), scratch. Time, 9:44.85.

BAD WEATHER AND ROADS HANDICAP GLIDDEN'S TOUR

Trophy Donor Finds Not All Plain Sailing on Route of Abandoned A. A. A. Tour—One Outsider Fails to Share Glory.

For the first time since he left Detroit, on October 14th, Charles J. Glidden, who is endeavoring to follow the itinerary of the abandoned A. A. A. National Reliability tour, was forced to cut short his day's run and lay over at Clarksdale, Miss., on Tuesday, 22d inst., when he had hoped to reach Greenwood, 75 miles beyond. A combination of miserable roads and inclement weather was responsible for the delay. When he arrived at Clarksdale, Glidden, who is piloting a Maxwell car, had covered 1,095 miles since he left Detroit, having made night stops at Fort Wayne, Ind., Indianapolis, Louisville, Ky., Cave City, Ky., Nashville, Tenn., Sheffield, Ala., and Rogers Springs, Tenn.

Motorists along the route still are responding to the general invitation extended to "come out" and accompany the trophy donor from place to place, but Howard L. Waltrous, who left Cleveland in a Hupmobile two days after Glidden had started on his tour, and who overtook Glidden at Nashville on Saturday last, was not received with open arms. Waltrous did not conceal his purpose of gaining publicity for the Hupmobile, but was denied even the privilege of having his car "snapped" by the "official" photographer along with the other escorting cars, and was given to understand that there was only glory enough for one.

Three Share Honors at Evansville.

Three shared in the honors which attached to the combined automobile and motorcycle racemeet staged on the half mile track at Evansville, Ind., on Wednesday, October 16th, under the auspices of the Evansville Automobile Club. Kilpatrick (Hotchkiss), who took the five-mile free-for-all handicap in 6:56⅘, and Disbrow, who drove the Simplex to victory in an Australian pursuit which went for 3½ miles, won the two feature events. The other competitive number, a three-mile Class C event, went to Endicott in a Case, who completed the distance in 4:42, leading home two other contenders, Nikrent (Case) and Ulbrecht (Case). Disbrow also drove two exhibition miles, one in the reconstructed Fiat and the other in the Simplex, his times for the double circuits in the respective mounts being 1:18⅗ and 1:12 flat, which completed the program.

Digitized by Google

1,017,407. Transmission Mechanism for Automobiles. Max H. Grabowsky, Detroit, Mich. Filed June 21, 1911. Serial No. 634,555.

1. In a transmission mechanism two portions of a shaft, an equalizing gearing having a ring uniting the portions of said shaft, said ring being provided with teeth, the inner end of one of said shaft portions being provided with teeth and means for moving said portion of said shaft longitudinally to engage and disengage said teeth for the purpose described.

1,017,498. Piston for Explosive Engines. John Bittner, Newcastle, Ind. Filed Feb. 7, 1911. Serial No. 607,101.

1. A piston comprising a hollow body, a head detachably fitted to and closing the hollow body and having a portion projecting therein, a rod, the projecting portion of the head and the rod having transversely registering openings, and a pin passing through the openings of the head and rod and connecting the latter to the former and adapted to be retained in place by the inner walls of the hollow body.

1,017,536. Silencer for Internal Combustion Engines. Mark Frank Graydon, Trenton, Ontario, Canada. Filed Oct. 9, 1911. Serial No. 653,730.

1. In a silencing device for internal combustion engines having an exhaust pipe, a valve seat secured to the exhaust pipe, a spider secured to the valve seat, a valve, a stem on said valve slidably mounted in the spider, and means for holding the valve in a normal closed position against the valve seat and an expansion casing having a dome shaped top and an exhaust aperture below said top, as and for the purpose specified.

1,017,538. Engine Starting Apparatus. Edward A. Halbleib, Rochester, N. Y., assignor to Northeast Electric Company, Rochester, N. Y., a Corporation. Filed Apr. 12, 1911. Serial No. 620,683

1. An automatic selector for engine-starting apparatus having, in combination, valves for controlling the admission of air to the respective cylinders of an engine, said valves being movable into open position by pressure from the respective cylinders, and connections between the valves whereby movement of either valve to open position causes the movement of a plurality of the other valves to closed position.

1,017,572. Attachment for Carburetters. James B. Lund, Chicago, Ill. Filed Dec. 18, 1911. Serial No. 666,314.

1. The combination of a carburetter, a pipe adapted to connect said carburetter with an engine manifold, and means adapted to be actuated by temperature and pressure for automatically regulating the temperature of the mixture delivered from said carburetter through said pipe.

2. The combination of a carburetter, an air intake pipe connected therewith, a shutter disposed in said pipe for controlling the relative proportions of hot and cold air delivered to said carburetter, and means actuated by variations in temperature and pressure for automatically controlling the operation of said shutter.

1,017,591. Method of Governing Internal Combustion Engines. Thomas Rigby, Dumfries, Scotland. Filed Oct. 16, 1911. Serial No. 654,941.

1. A method of governing internal combustion engines in which the main charge is drawn in on the suction stroke, which consists in admitting to the working cylinder at or near the end of the suction stroke, a supplementary charge cooled to a temperature below the temperature of the charge, and in varying the amount of the supplementary charge in accordance with the load.

1,017,592. Method of Working and Governing Internal Combustion Engines. Thomas Rigby, Dumfries, Scotland. Filed Oct. 16, 1911. Serial No. 654,942.

1. A method of working internal combustion engines in which the main charge is drawn in on the suction stroke, which consists in admitting to the working cylinder a supplementary charge cooled to a temperature of the usual charge at or near the end of the suction stroke when the load of the engine exceeds a predetermined amount.

1,017,597. Magneto. James E. Seeley, Los Angeles, Cal., assignor to High Frequency Ignition Coil Company, Los Angeles, Cal., a Corporation of California. Filed Jan. 31, 1911. Serial No. 605,775.

In a magneto, the combination with the field pole pieces of an armature, mounted to rotate between said pole pieces, and comprising heads having opposite notches, a core consisting of H formed laminations, having arms extending into said notches to secure the laminations in place, and segmental pole pieces secured to said flanges, and extending over and in contact with said core.

1,017,598. Tire. Arthur Seelig, Wilmersdorf, Berlin, Germany. Filed Sept. 6, 1911. Serial No. 647,802.

1. A tire, comprising a rim, and split resilient rings located transversely thereof, the lower part of the legs of each ring being completely inclosed by the rim, and means for preventing rotation of the rings within the rim, consisting of a projection on the one part engaging in a recess in the other part, and a compression-spring located in the gap between the two ends of the ring.

2. A tire including a rim having passages formed therein, split rings having their ends sliding in said passages, and coil springs interposed between the ring ends.

1,017,643. Automobile Curtain Support. Merle B. Barton, Peoria, Ill. Filed Dec. 27, 1910. Serial No. 599,442. (Cl. 21—62.)

In combination with a vehicle door, a collapsible curtain holding frame consisting of two uprights, a separate member pivoted at one end to the upper end of each of said uprights, said members being pivotally connected at their free ends, means for detachably securing the frame to the door, and a curtain secured at one of its edges to one of the uprights, and means at its opposite edge to detachably secure that edge to the opposite upright.

1,017,660. Shock Absorbing Device. Claud H. Foster, Cleveland, Ohio. Filed Apr. 9, 1908. Serial No. 426,144. (Cl. 21—105.)

1. The combination, with a pair of relatively movable members, of a shock absorbing device comprising a spiral spring having an open central portion operatively connected to one of such members and having its outer portion flexibly connected with the other member, and friction material interposed between some of the outer convolutions of said spring.

1,017,661. Cleaning Device. Claud H. Foster, Cleveland, Ohio. Filed Feb. 14, 1910. Serial No. 543,733. (Cl. 15—59.)

1. The combination, with a frame for a pane, of a coiled spring supported by said frame, said spring being provided with an extension, and a cleaning member carried by said extension and arranged to be moved in an arc across a portion of the surface of said pane.

1,017,681. Starter for Internal-Combustion Engines. Frank G. McKlveen and Leslie W. Naylor, Denver, Colo.; said Naylor assignor to said McKlveen. Filed Jan. 30, 1911. Serial No. 605,642. (Cl. 123—185.)

1. The combination with an engine shaft, of a wheel mounted thereon and connected in operative relation therewith, a device for operating the same, a spring connected with one extremity of the device, the said device having a section normally held in engagement with the wheel by the spring, said section having a centrally located space and the wheel being equipped with teeth adapted to move in said space, whereby the wheel may rotate without moving the device, the portion of the latter, beyond the said section, being adapted to engage the teeth to operate the wheel, and means for actuating the device to operate the wheel for engine-starting purposes, substantially as described.

1,017,689. Electro-Whistle Alarm. Charles H. Rettmann, Chicago, Ill. Filed May 6. 1911. Serial No. 625,510. (Cl. 177—311.)

1. In a device of the character described, the combination with a casing, an electromagnet therein, of a cover therefor, means on the cover operable by impulses of air to produce sound, a diaphragm, and diaphragm moving means associated with said diaphragm and magnet to produce impulses of air for the sound producing means.

1,017,732. Tire. Frederick E. Blaisdell, Philadelphia, Pa. Filed Jan. 31, 1911. Serial No. 605,694. (Cl. 152—2.)

1. An anti-skidding stud for tires having an elastic cover wound thereon under tension.

1,017,750. Mixer for Gaseous Fuel. George T. Hanchett, Hackensack, N. J. Filed July 16, 1908. Serial No. 443,748. (Cl. 48—180.)

1. In a device of the character described, the combination of a carburetter casing having a chamber therein, a heating coil within said chamber against which mixed air and fuel may impinge, said coil having a plurality of turns in each of several substantially parallel planes and surrounding a common axis, and entrance and exit ports, said coil lying in the path between said entrance and exit ports.

1,017,762. Clutch. Frank H. Jones, Muncie, Ind., assignor to Warner Gear Company, Muncie, Ind., a Corporation of Indiana. Filed Feb. 10, 1910. Serial No. 543,150. (Cl. 192—10.)

1. A multiple disk clutch comprising a rotary head formed integral with the supporting shaft and having a pluralitp of circumferentially arranged axially parallel arms, a wearing plate secured in position along one edge of each of said arms, a plurality of friction rings nested within said arms and having outwardly extending fingers projecting between said arms and engaging a wearing plate, a shaft arranged axially relative to the rotory head and projected into the space between its arms, a head secured to the inner end of said shaft

Digitized by Google

and lying within the space between said arms, said head having a plurality of axially extending grooves in its circumference, a wearing plate detachably mounted in one side of each of said grooves, a plurality of friction rings interdigitated with the first mentioned friction rings and having inwardly projecting fingers lying within the grooves of the last-mentioned head and engaging said last-mentioned wearing plates, and a clamping member rotatively connected to the first mentioned head and arranged to force the interdigitated friction rings into engagement with each other.

1,017,764. Wheel Tire. Paul M. Kemter and Arthur W. Hentschel, West New York, N. J. Filed Dec. 14, 1910. Serial No. 597,293. (Cl. 152—8.)

A tire of the class described comprising an outer sheathing of rawhide having clencher enlargements, a core formed from a single coil of wire, a sheet metal wear member curved transversely to conform to the curvature of the core and bearing around the outer portion of the same, an intermediate fabric member between the outer member and the core and detachably united at its edges, a fabric enlarging member between the outer portion of the outer member and the intermediate member, a fabric enlarging member between th outer portion of the intermediate member and the metal wear member, and fastening devices extending through the outer sheathing the intermediate member and the enlarging member, said fastening devices bearing at their inner ends upon the wear member.

1,017,794. Circuit Breaker for Magneto-Electric Machines. Carl A. Pfanstiehl, Highland Park, Ill. Filed Apr. 18, 1910. Serial No. 556,245. (Cl. 123—166.)

1. In a circuit breaker of the type herein described, the combination of an armature housing, a casing formed with a lateral pocket and adapted to having a turning adjustment on said housing, a cam disk arranged in said casing and receiving motion from the armature shaft, a movable contact lever pivoted in said casing and operatively engaging said cam disk, a plug of insulating material formed with marginal grooves engaging the margins of an orifice in a wall of the lateral pocket aforesaid, and a fixed contact member mounted on said plug and arranged in the path of the movable contact lever aforesaid, substantially as set forth.

1,017,809. Puncture Closure for Pneumatic Tires and the Like. Robert Sampson, Montreal, Quebec, Canada. Filed Apr. 21, 1910. Serial No. 556,896. (Cl. 152—26.)

A puncture closure for pneumatic tires and the like embodying, in combination with an interior sealing member, an exterior clamping member comprising a thin, concavo-convex, skeletonized metal disk provided with a centrally-disposed, interiorly-threaded neck, a shield of elastic material surrounding said disk and extending through the skeletonizing openings therein, and a shank secured to said interior member and engaging the threaded neck of the exterior member.

1,017,814. Resilient Tire. Semple S. Scott, Chicago, Ill. Filed Apr. 27, 1911. Serial No. 623,728. (Cl. 152—8.)

1. A tire consisting of a plurality of circumferential rows of radially extending blocks, means for supporting said blocks so that each may yield independently in a radial direction toward the tire center, said blocks having outer ends which together constitute the tread of the tire, each block having the edges of its outer end located closely adjacent to the edges of the outer ends of the adjacent sides of adjacent blocks being inclined away from each other toward the tire center.

1,017,877. Change Speed Gearing. Abraham B. Landis, Waynesboro, Pa. Filed Oct. 26, 1907. Serial No. 399,252. (Cl. 74—26.)

1. A change speed gearing comprising a driving and a driven shaft, a series of disks slidably mounted upon each shaft and arranged with those on one shaft engaging between the adjacent faces of those on the other shaft, means for clamping said disks by a force automatically adjusted to the load, one of said shafts being mounted in adjustable bearings, said bearings and means for adjusting said bearings to carry the shaft therein toward and from said other shaft, substantially as set forth.

1,017,900. Apparatus for Deodorizing the Exhaust Gases of Motors. Charles H. Phillips, Paughkeepsie, N. Y. Filed July 27, 1911. Serial No. 640,941. (Cl. 110—183.)

1. The herein described gas deodorizing apparatus consisting of an upright cylindircal receptacle adapted to contain deodorizing liquid, an inclined baffle plate secured across its interior and having a passage through it near its lower edge and below the liquid level, a gas inlet pipe opening through one side of said receptacle below the lower edge of the plate, a discharge pipe opening through the top of the receptacle above the upper edge of the plate, and a transverse row of tubes seated in and opening through said plate with their bodies standing at right angles to it and their bores directing the gases obliquely across the interior of said receptacle from a point beneath the upper portion of the plate to a point above it remote from said discharge pipe.

1,017,909. Traction and Non-Skid Device. James W. Reid, New York, N. Y. Filed Mar. 16, 1911. Serial No. 614,772. (Cl. 152—2.)

1. A traction and anti-skid device comprising a plurality of traction members, each being substantially of J-shape and having its ends extending radially of the wheel, the short end of each traction member terminating in an offset portion adapted to extend within the felly of the wheel, the longer ends extending to points adjacent the hub of the wheel, and connecting members adapted to connect the longer ends of said traction members.

1,017,919. Spring Wheel. Samuel P. Sanders, Aurora, Neb., assignor of one-half to Christian C. Grosshans, Aurora, Neb. Filed Aug. 18, 1910. Serial No. 577,744. (Cl. 152—52.)

In a spring wheel, the combination, with a tread rim, an inner rim, and spokes rigidly connecting the rims of a hub having an annular groove, a bumper secured in the groove, a bumper ring carried by the inner rim within the said groove with a space between the ring and the hub-bumper, and a series of spiral springs on each side of the spokes and forming the only connection between the hub and the tread rim.

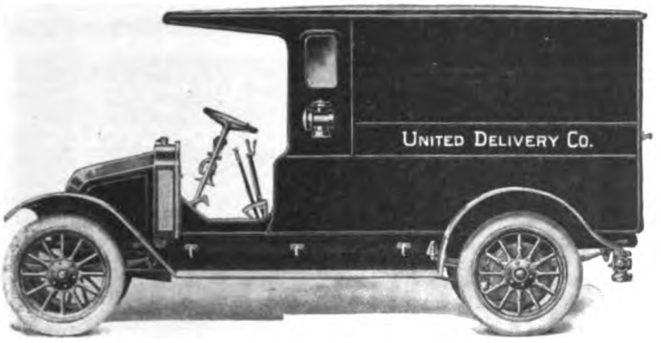
1,017,923. Driving Mechanism. George Washington Slater, Oakland, Cal. Original application filed Nov. 17, 1910, Serial No. 592,899. Divided and this application filed Oct. 5, 1911. Serial No. 653,037. (Cl. 74—7.)

1. A shield housing to be used in connection with a motor vehicle, comprising a pair of sections, each section being provided with a pair of legs adapted to straddle the axle of a vehicle for supporting said sections being provided with a socket portion, a drive shaft passing through one of said sections of said housing and a gear thereon, said gear fitting in said socket formed in one of said sections, an auxiliary shaft passing through the other of said sections of said housing and a gear thereon fitting in said socket and meshing with said first-mentioned gear, and means for securing said sections together.

1,017,938. Sounding Horns. Alva Williamson, Atlantic, Iowa. Filed Mar. 29, 1910. Serial No. 552,188. (Cl. 116—1.)

1. In a device of the class described, the combination of an engine exhaust pipe, an inelastic gas storage receptacle in communication with the exhaust pipe, said exhaust pipe being provided with an outlet other than the one leading to the storage receptacle, a manually operated valve device whereby the exhaust gases may be directed either into the storage receptacle or through the said outlet, a check valve interposed between the exhaust pipe and the storage receptacle to prevent the flow of gas from the storage receptacle to the exhaust pipe, a pressure equalizing receptacle, there being a restricted passageway provided between said receptacle and the storage receptacle and with a wind instrument operatively connected with the equalizing receptacle, the passageway from the equalizing receptacel to the wind instrument being unobstructed, whereby gas under fluctuating pressure in the exhaust pipe may either be discharged or directed into the storage receptacle, and the said gas under unequal pressure in the storage receptacle may be delivered to the wind instrument at a substantially uniform pressure, for the purposes stated.

1,017,988. Vehicle Wheel with Elastic Spokes. Heinrich Munk, Berlin, Germany. Filed July 30, 1907. Serial No. 386,248. (Cl. 152—51.)



An elastic wheel comprising in combination a hub and a felly, and a number of spokes between the same consisting each of one endless pear-shaped blade or band spring having curved or arc-shaped inner and outer portions and attached to said hub and felly respectively, the adjacent spokes being further connected at their outer and inner arc-shaped portions, substantially as and for the purpose set forth.

Reissues.

13,368. Explosive Engine. Cyrus E. Mead, Dayton, Ohio, assignor, by direct and mesne assignments, to The Mead Engine Company, Dayton, Ohio, a Corporation of Ohio. Filed May 8, 1911. Serial No. 625,903. Original No. 921,264, dated May 11, 1909, Serial No. 423,094.

1. In an explosive engine, the combination with a cylinder having pockets and ports therein, a piston, a main shaft, and a connection between said piston and said main shaft, of a rotary inlet valve, a rotary exhaust valve, said valves being independent of each other and provided with ports adapted to register with the ports in the cylinder, caps having ports adapted to register with the valve ports, an independent shaft for each of said valves, a driving shaft common to said valve shafts, gears interposed between the valve shafts and said common shaft, and means for actuating the common shaft from the main shaft of the engine.

Panel Body, Capacity 1500 Pounds

Stewart Delivery Cars

A Car for Every Business

Special Express Body with Wire Grating, Capacity 1500 Pounds

Dealers—Sell Delivery Cars That All Merchants Need

Stewart delivery cars can be used more generally by merchants than any other type or size of car. Their capacity (1500 pounds) is just right to make them suitable for an unlimited number of users.

They are as good for heavy articles—up to their capacity—as for light package delivery; as efficient for long distance deliveries as for frequent stops and short routes.

Customers in Every Line of Business

The dealer who sells the Stewart has an enormous field in which to work—and a business that is not only steady the whole year 'round, but is permanently lasting and profitable. Every merchant who has goods to deliver or to receive, every business using one or more horses for carrying purposes will find the Stewart the ideal car for economy, dispatch, and reliability.

The Stewart delivery car is a better paying proposition than the handling of pleasure cars or commercial cars of any other type. The touring car business involves the keenest of competition, is good only in seasons and is affected unprofitably by the necessity of expensive showrooms and entertainment, trading in old cars and constant costly service.

Stewart cars are very easily handled, have lots of loading space, ride easily, and are great time savers. Their cost of operation is very low, considering their efficiency, and the design of the Stewart car aids particularly in eliminating repair expense. All vital parts are easily reached and quickly removable or interchangeable.

These high class features make the Stewart delivery car the best selling commercial car on the maryet and the best buy for the customer:

30 h.p. Continental motor
Timken axles, front and rear
Brown & Lipe selective transmission
Multiple disc clutch
Left-hand steering, center control
Demountable rims
Bosch magneto
Roomy bodies of new design
7-foot loading space
Complications eliminated
Chassis price $1650

A trouble saver for the motorcyclists

This book contains more practical advice for the rider, more good hard sense, more suggestions as to how to keep out of trouble, and how to get out of it, than has ever been printed heretofore in any one book.

¶ It fits the coat pocket and it includes free engine clutches, two-speed gears, mechanical lubricators and magnetos, together with special matter on motors, valves, carbureters, fuel and important general subjects, all plentifully illustrated.

¶ Dealers and jobbers in all parts of the country are selling "Care and Repair of Motorcycles" to both new riders and veterans as the best aid in correcting and avoiding motorcycle trouble.

DEALERS—

Out of EUROPE Comes The Aristocratic

METALLURGIQUE

The Car You Can Sell to Men of Means and Fine Discrimination

¶ Are you in a position to locate and interest men of means, social standing and ability to recognize a car of impressive individuality, tremendous prestige and sterling performance.

¶ If so, we will use our sales organization to assist you in selling the Metallurgique, Europe's most talked of car and the one most sought after.

¶ This automobile is the product of fifty years steel making near Brussels, the Pittsburgh of Europe. In materials, it stands alone in quality. Its chassis is a revelation in construction that has given it a proven title, "The unbreakable car." In body design it is a model of sensational European originality that causes even the blase New Yorker to turn to admire.

¶ Metallurgique dealers have as sales ammunition a list of owners that reads like the International Social Register. Write for our beautiful brochure—it will introduce us.

"The Horn that's Made for the Discriminating"

TUTO HORN

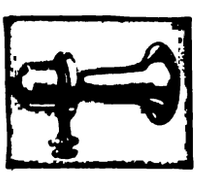
THE TWO TONE HORN

Forces Attention.

IN the case of an emergency, the TUTO horn forces attention in a most natural manner, which is exclusive with the TUTO method of operation.

¶ The low note of the TUTO is used for all regular service, and being more distinctive than the bulb horn gets the right of way 90% of the time.

¶ When this low note fails to attract attention, or in case of emergency, it is possible to go from the low to the loud signal instantly, by the mere increasing on the pressure of the same button used to make the milder signal.



¶ The quickly going from the low note to the one of more power, forces attention the same as the shouting of a command supplementary to a request which has been made in the ordinary tone of voice.

¶ There is no paralyzing action, as the low note serves as an introduction and the way is positively cleared without fuss or confusion.

¶ On the other hand, the inflexible, one-loud-note electric horn has a tendency to startle and paralyze the person to inaction. With such a signal, there is always the possibility of promoting accidents rather than averting them.

¶ The TUTO horn is a true safety signal as it acts naturally and requests or demands the right of way in a tone corresponding in loudness to the requirements of the situation.

¶ Such a warning device is best for standard equipment.

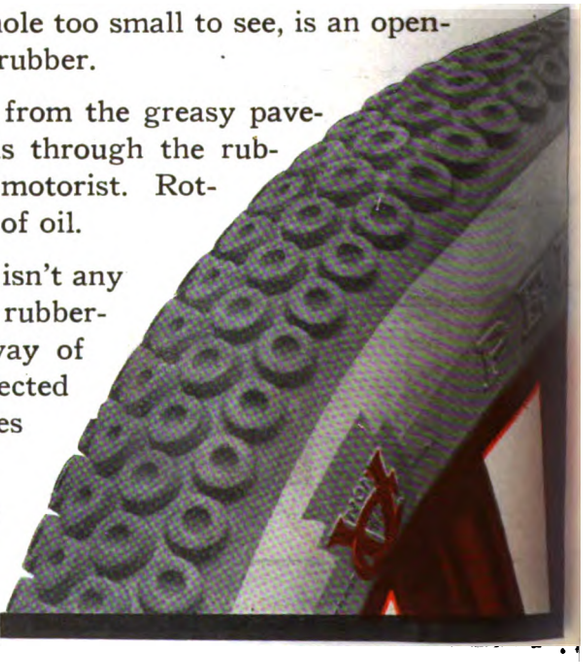
That's what you can say to your customer when you sell him

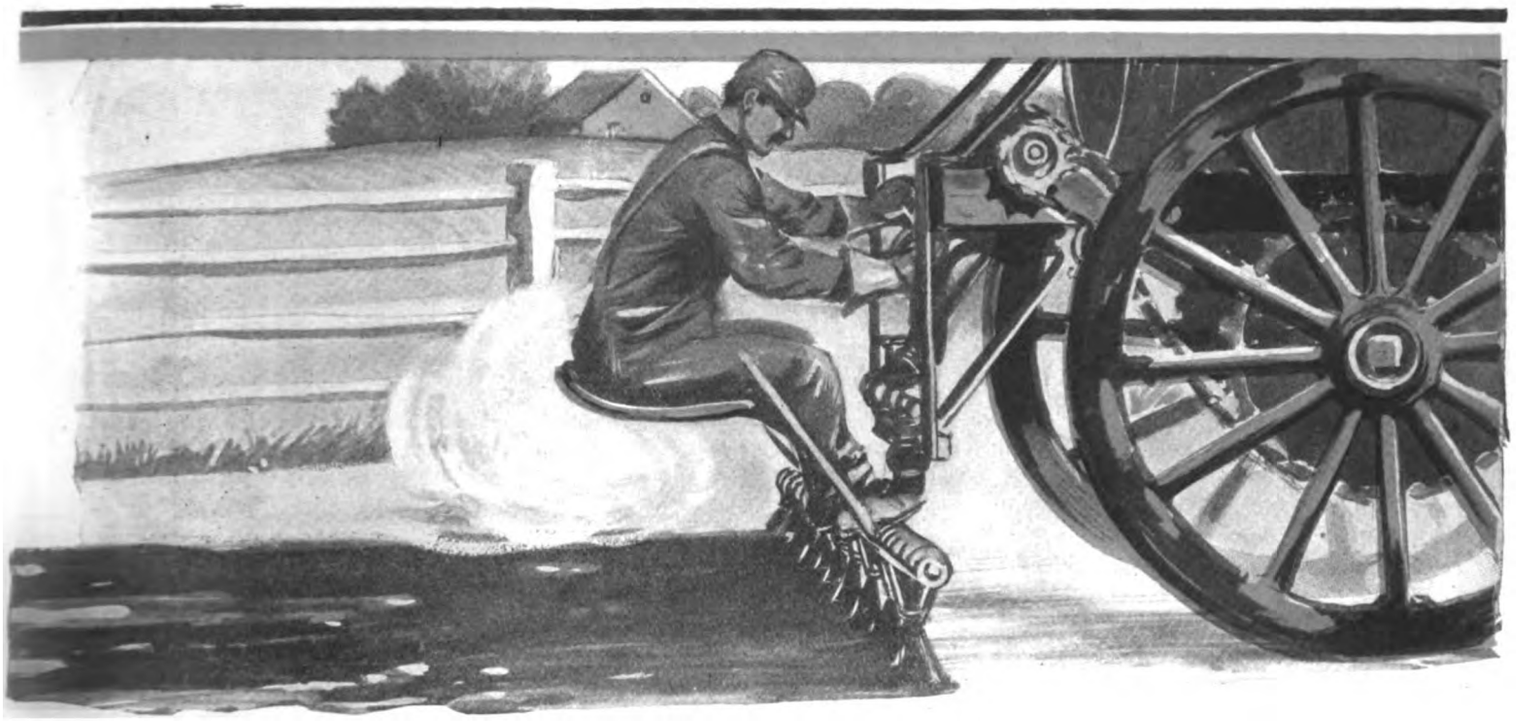
PENNSYLVANIA Oilproof VACUUM CUP TIRES

And this is the biggest thing that ever *was* said about tires or ever *will be* —



Because Oil disease has always been the real big tire bugaboo—has cost the motorist more than all other tire ailments combined. Every pore, every little cut and hole too small to see, is an opening for Oil to creep in and begin its work of disintegrating the rubber.

Oil disease is the right word. Tires catch it from the oiled road, from the greasy pavement where motors stop, from the oily garage floor. It spreads through the rubber. The tread goes to pieces. "Rotten tire," says the disgusted motorist. Rotten indeed, not ***manufactured*** so, but ***become*** so from the action of oil.

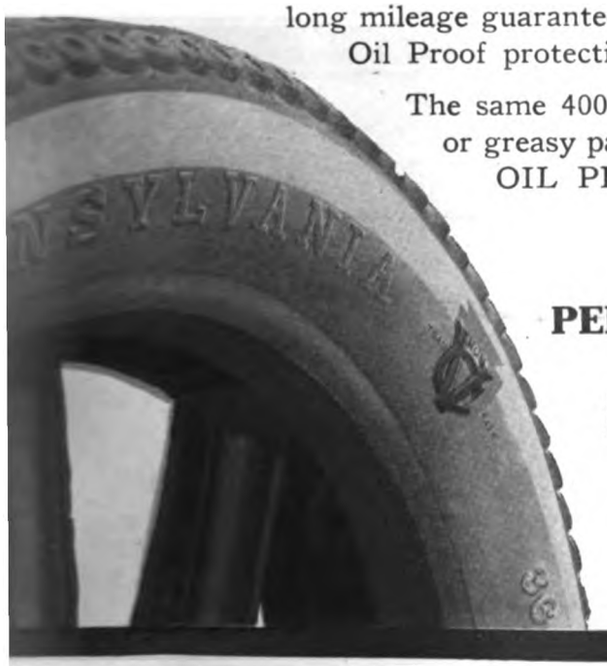


We reasoned this way: There isn't any substitute for oil, there isn't any substitute for rubber. There is no practical way of taking the rubber-destroying element out of the oil. But there ought to be a way of making rubber Oil Proof. And we finally perfected the Oil Proof rubber compound that now goes into Vacuum Cup Tires.

NON SKID TRADE MARK REG. U.S. PAT. OFF.

A grand achievement on top of the Vacuum Cup Success—the one ***entirely non-skid*** device.

Digitized by Google



When we say ***oil proof*** we mean OIL PROOF. Absolutely unaffected by oil. We have had samples from our Oil Proof Vacuum Cup Tires in oil for months. The rubber has remained absolutely unchanged without loss of life, strength or toughness.

Now Let's Get Down to the Business End

OF COURSE we are going to drive this greatest of all tire improvements home to the consumer. We are hitching "Oil Proof" up to "Vacuum Cup" in round style in our advertising in The Saturday Evening Post, Collier's, Life, other weeklies and the monthly magazines.

The VACUUM CUP Non-skid has scored a tremendous success. Combined with the OIL PROOF quality—well, weigh the question yourself. Will it make a ten strike with the tire expense ridden Motorist? For every one who has demanded Vacuum Cup Tires for its Non-skid safety and long mileage guarantees will there be three who will demand them for the added Oil Proof protection? Or will there be five—or a dozen?

The same 4000 mile guarantee, the same guarantee against skidding on wet or greasy pavements, the same extra heavy sizes, the same prices—***and*** OIL PROOF.

If you are already a Vacuum Cup dealer, revise your orders upward.
If you are not handling Vacuum Cups—well, don't be left behind, that's all.

The Dorris Line

BUILT TO LAST

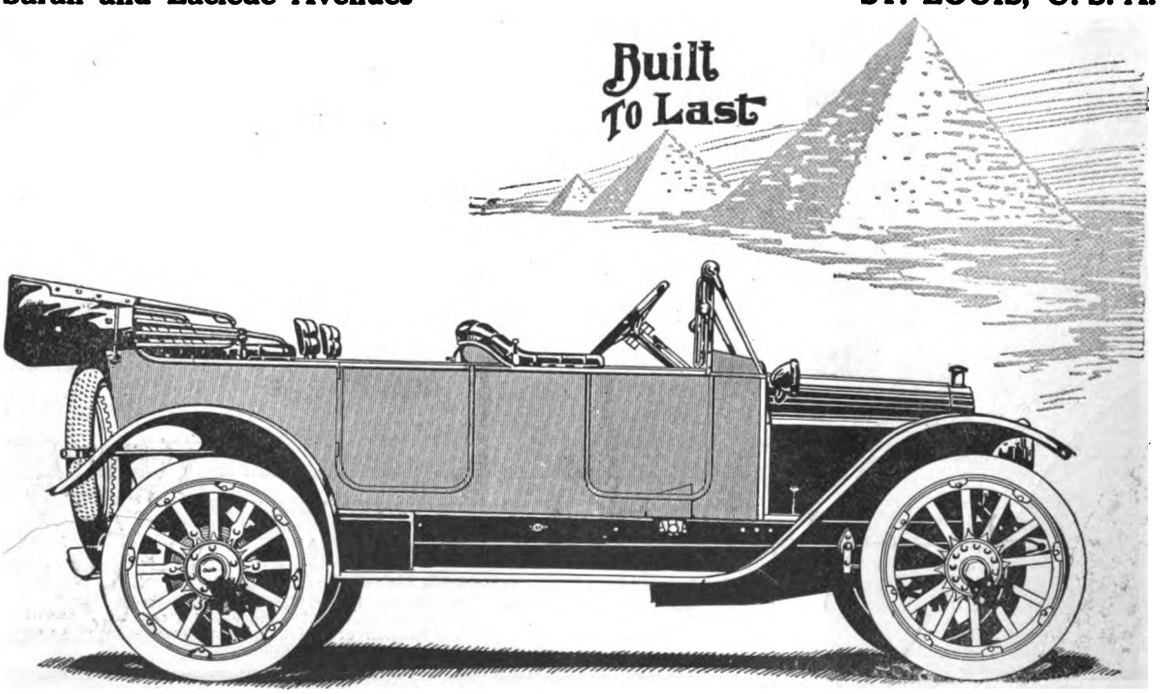
Mr. Dealer: Some automobile dealers make only a scant living out of their business. Are you one of these? Are you doing business as did your forefathers who are under the ground? Or have you fallen in line with modern methods that have revolutionized selling in all lines? You are in business for profit—have you adopted the modern, high profit methods which are the outgrowth of the experience and mistakes of the past?

Today or tomorrow you will have a call for a **high grade** MEDIUM PRICED car. There is a staple and steadily growing demand for machines of this sort. If you handle only a **high priced** or a **low priced** car, the prospect for a **high grade** MEDIUM PRICED CAR will certainly buy elsewhere. Your cars do not appeal to him.

The secret of maximum profit is to supply every demand—to handle a car for every class of trade—to get a **good** chance at **all of your market.**

You may not want the Dorris Car now, but

You Will Want the Dorris Car When You Know It



It is one of the sturdiest, most comfortable, smoothest running, longest lived cars built regardless of price.

One big reason why the average agent don't make money today is because service to his customers costs him too much. The Dorris minimizes this trouble because it probably requires less service to keep it keyed up to its best, and gives this service longer than any other car on the market. The first car built 8 years ago, is still in regular daily use. The reasons are many.

We have some mighty interesting information for you—write for the details of our proposition.

From the Dash

Your Trade is Looking for a Real Gasoline Saver

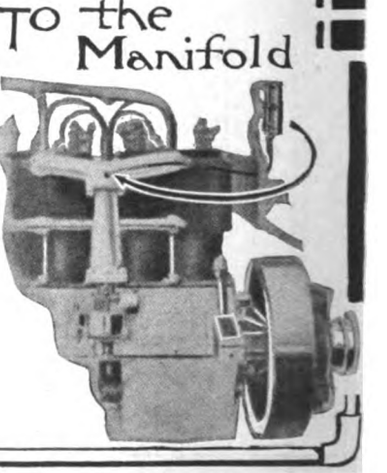
HERE IT IS

Every car owner can be interested in the National Compound Mixer and Primer—a device which is positively invaluable to car owners who want to get the most and best out of their cars.

Increases Power from 10 to 40 Per Cent.
Saves 10 to 40 Per Cent. Gasoline
Can be Installed in 20 Minutes

THE NATIONAL COMPOUND MIXER & PRIMER

Performs a triple function: **Making a Poor Mixture Perfect**
Priming the Engine
Cleaning the Engine



It is a notorious fact that a large proportion of gasoline enters the cylinder in an unmixed state and is simply burned out. With our device this is impossible.

You will note that the pipe running from the mixer enters the manifold intact right at the "Y," and under all conditions of speed, temperature, etc., it furnishes exactly the right amount of air for every drop of gasoline, absolutely eliminating all waste of fuel.

We call particular attention to the primer in its dual capacity. A turn of the primer valve will instantly furnish all cylinders with the proper amount of gasoline and air properly mixed for starting. This primer will also clean the cylinders by simply using several ounces of alcohol or kerosene, running the engine on retarded spark.

The whole story is before you in word and picture, and if you want to get a real live seller—one that will produce rapid and profitable sales, then write today for our dealer proposition.

National Manufacturing Co.
Kalamazoo, Mich.

This Engine will give More Speed and Power and It will avoid 50% of Engine Distemper

SHELDON

Brake Equipment E-11

New Features Unusual Steel

Highest Braking Efficiency

This equipment is an unusual combination with design embodying radical improvements and materials that are quality clear through.

We claim for it out-of-ordinary features of strength, quick response, power and durability. Both brakes are on the axle, taking all strain from chain and doing away with the jack shaft bending period.

Inside and outside brake arrangement keeps down the extreme bending moment on the axles and allows bearings to be placed almost under the line of the sprocket. They are of the "wrap up" or self intensifying type, giving prompt action, more uniform wear and pressure on drum—reducing the unit pressure on drum and prolonging the life of the lining. A factor of safety of 4 to 1 is standard under the heaviest emergency strain.

Spider and parts are built of best steel castings. Radius rod shank of chrome nickel steel—drop forged fork—perfected lubrication.

These are bare facts that outline in part the story of Brake Equipment E-11. Blue prints and specifications are at your disposal.

Lancia Cars

"They copied all they could follow,
But they couldn't copy my mind,
And I left 'em sweating and stealing
A year and a half behind."
—Kipling

DEALERS You Can Sell This Car

"The Best of Europe At American Prices"

The Lancia propaganda has taken root and is growing in America—and the reason is mighty obvious.

There is a class, Mr. Dealer, and a restricted one at that, who understands, appreciates and buys this peer of light European cars—(we will send you the names on request).

And there are those in *your* territory to whom its combination of strength, efficiency, simplicity and design will appeal.

The Lancia is the best of Europe at American prices—meaning that the purchaser of a Lancia car does not have an extravagantly priced European novelty of freak design—

But a *real service car* from Europe—a masterpiece of European design, steel and finish—made and tested in the Alps under the personal supervision of Vincenzo Lancia himself—with a guaranteed value, pound for pound, dollar for dollar greater than that offered by any American or European manufacturer.

Do you want to sell a car of class, service and beautiful design to the fastidious and critical? If you do, then come to New York if possible—see and know the Lancia—or write and let us give you details of the "20" and "30" mounted with coach work in keeping with the chassis.

The Music Master of Timkenville

FF in a quiet corner, in a sound proof cabinet, sits the man with an ear for music.

Listening all day to the hum of the bearings as they whirl on the spindle before him.

He's giving the last—the "musical test" to each

TIMKEN
Roller Bearing

Like a grand piano his instrument has a long, thin sounding board.

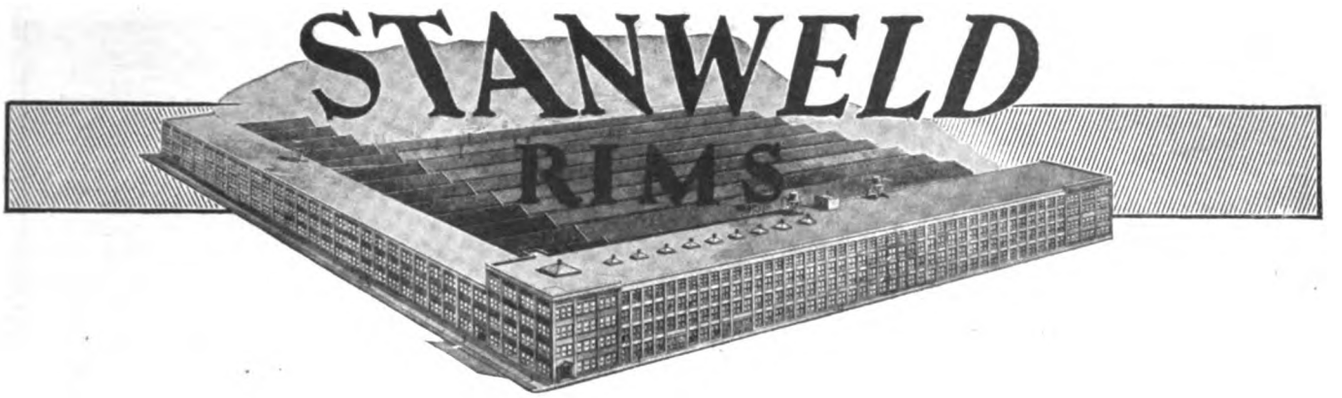
As rollers revolve, and cups and cones spin, they give forth a musical tone. That is—if the bearing is perfect.

But let there be present the slightest thing wrong and the sound becomes discord—not music.

Before bearings come to the musical choir each part is inspected and tested. The rollers are sorted by guaging machines, the bearings assembled and run under load at high speed.

The Music Master's test is a final test for quietness and "sweet running."

It was rightness of principles that first brought success and fame to the Timken Bearing.



Added to right design comes a value unseen, in right steel, right heat-treatment, right inspections and testing.

And topping off all comes this delicate test—the test that the Music Man gives them.

The Timken Roller Bearing Company

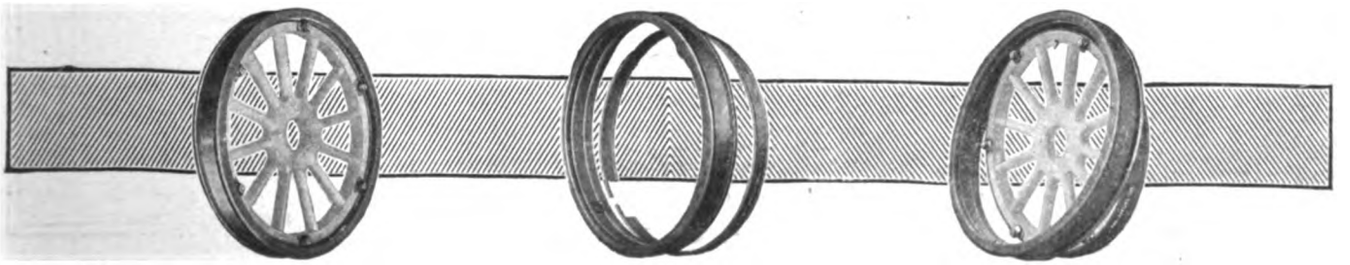
For Every Car For Any Tire

STANWELD rims are not the product of a self conceit.

Mechanically they fulfill every requirement of the car owner, car manufacturer and tire maker.

Structurally they are the culmination of rim making as evolved by the pioneers and masters of the craft.

Method of releasing Spring Latch from Lock



Method of prying Detachable Side Ring from Groove Note position of Latch

Not a part—not a piece of material—not a function but that is a proved betterment over all former types of rims.

Priced for the multitude and used as standard equipment on America's superlative cars, their destiny as universal equipment is assured.

The Standard Welding Co., Cleveland, Ohio

Let's Reason Together—*about Price*

TO you who are considering buying a motor car, we want to offer a few suggestions on the subject of price. Please do not think these are wholly selfish. Of course, we want to sell you a Chalmers car if possible. But whether you buy a Chalmers or not, we believe we can help you. For the suggestions we make are based on the experience of thousands of buyers.

And so we say to you, first of all: Buy a real car. Don't economize too closely on the purchase price. Economy is not merely spending the least money; it is getting the most for your money. And buying an automobile at too low a price is the worst economy in the world.

If a man is going to pay $1000 for a motor car, he surely is not so pressed for funds that he could not afford to add enough more to that $1000 to get him a really high grade motor car—a car of genuine quality. The additional cost, distributed over the years he will use the quality car, is nothing compared to the satisfaction of owning it.

If a buyer doesn't get a car of real quality to start on, he will surely want one later. Many who purchase low priced cars graduate from what they buy to what they should have had to begin with. But in doing this they pay from $300 to $600 for so-called "automobile experience."

You don't need this costly experience. For nowadays anyone can learn to handle the most expensive car as easily as the cheapest. So buy a quality car to start with.

If you investigate, you will find that there is a great difference between a $1000 car and a $1950 Chalmers—even greater than the price indicates. Of course, there is some resemblance in these cars. They all have four wheels. They all have a motor. They have transmissions—and other things necessary to make the car go. In these respects, all motor cars are alike. Just as all horses are alike, because all horses have four legs, two eyes, a nose and a mouth.

But what makes one horse carry off all the blue ribbons while another is only a common hack? It is a difference in the quality of the two horses. And there is the same sort of difference in the quality of motor cars.

You can't buy more quality than we have put into the 1913 Chalmers "Thirty-Six"—no matter what price you pay. You would realize this if you could go through the Chalmers factory, if you could see these cars being made practically complete in our own shops—from front axle to rear license bracket.

We are building for the future. We believe firmly that those concerns that will be doing a big business five or ten years from now will be the ones that laid the foundation by putting honesty of construction and honesty of purpose back of the cars they are building now.

So we say to all those who are going to pay $1000 or more for a motor car: It is to your interest to examine the design, the features and the construction of the 1913 Chalmers "Thirty-Six" at $1950, fully equipped, and see if you really are not money in pocket by laying out the extra few hundred dollars in the original purchase price rather than buying a car at a lesser price, only to trade it in later at a big discount from the original purchase price.

Think over this price question and give us an opportunity of talking it over with you, so that you may at least be sure of having all the facts before signing your check for the car.

So see the 1913 models at our dealers. And send for our new book, "Story of the Chalmers Car." This is not the usual automobile story. We have been told by friends, even in the business, that it is the best automobile book written. Write for it.

Chalmers Motor Company. Detroit. Mich.

These cars have all the Comfort, Luxury, Good Looks and Convenience of any cars at any price.

On these points we believe you positively cannot buy more in any automobile than you get in the 1913 Chalmers cars.

"Thirty-Six" (four cylinders)	$1950
"Thirty" (four cylinders)	$1600
"Six," 5-passenger	$2400
"Six," 7-passenger	$2600
"Thirty-Six" Limousine	$3250
"Six" Limousine	$3700

(Prices include full equipment and are f. o. b. Detroit.)

Note these splendid features and judge for yourself the superiority of the 1913 Chalmers cars.

Electric Lights. Gray & Davis electric lighting system, acknowledged the best on the market.

Turkish Cushions. Most comfortable and highest grade automobile cushions made.

Eleven-Inch Upholstery. Featured on some of the highest priced cars.

Chalmers Self-Starter. A year's use has proved its simplicity, economy and reliability.

Long Stroke Motor. 4¼" bore; 5¼" stroke. A motor of unusual power. Built complete in the Chalmers shops. Four-forward speed transmission gives maximum of flexibility.

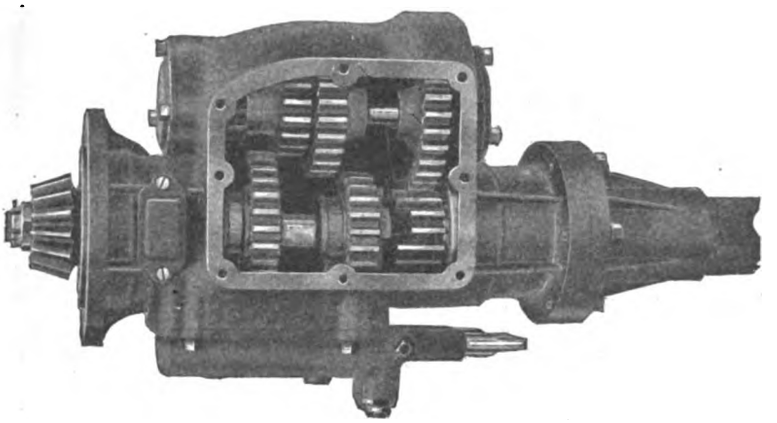
Continental Demountable Rims. Make it possible to change tires in a few minutes and without hard work.

Large Wheels and Tires. Insure easy riding and low tire upkeep. 36"x4" tires on "Thirty-Six"; 36"x4½" tires on "Six."

Beautiful Bodies. The new-design, flush-sided metal bodies are very roomy. Twenty-one coats of paint and varnish give unsurpassed finish.

Nickel Trimmings. Handsome; easy to keep clean.

Dual Ignition. Most reliable system built.



Improved Carburetor. Readily adjustable from dash to suit all driving conditions.

Speedometer. A jeweled magnetic speedometer, specially designed for Chalmers cars, is regular equipment.

Silk Mohair Top. A splendid, perfectly fitting top, tailor-made in Chalmers shops.

Rain-Vision Windshield. Easily adjustable, made especially to fit the Chalmers built-in dash.

JENCICK

Why we built the first successful United States torpedo boat engine and what this ought to mean to builders of quality commercial trucks.

Ordinarily the United States Government is a close buyer—but never at the expense of quality. In experimenting, however, price is a minor object—efficiency counts 100 per cent.

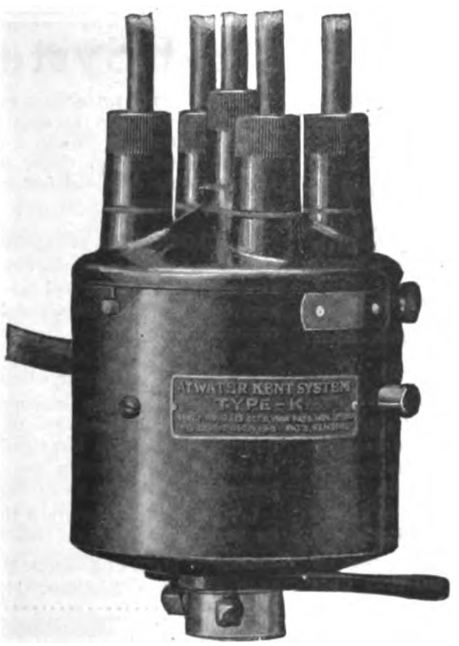
The motor shown here in a partially completed state was built on terms of not less than $15,000—nor more than $25,000—a wide latitude in which to operate—but we were bonded to make good.

The specifications called for not less than 200 H. P. sustained on a maximum run of 12 hours and a half speed run of 12 hours—pretty hard gruelling for a high speed marine engine.

To make a long story short, we turned this engine over to the Government and in tests made by Government officials, it **sustained 245 H. P. on the 12 hour high speed test with but 10 H. P. drop during the run.**

This engine was accepted and is now in active service.

Now, Mr. Truck Manufacturer—granting that Jencick engines are standard in hundreds of power craft, great and small—that they are **not** built on a price cutting competition plan but on merit (for which we charge)



Then is it not reasonable to suppose that we can build engines for you that will hold and build a reputation **that must be back** of the hard worked, much abused truck?

JENCICK MOTOR CORPORATION, PORTCHESTER

The New Atwater Kent Ignition System

With Automatic SPARK ADVANCE

DISTRIBUTORS

New York.....E. J. Edmond Co.
Chicago.....Motor Car Supply Co.
San Francisco, Chanslor & Lyon M. S. Co., Weinstock-Nichols Co.
Milwaukee.....Julius Andrae & Sons.
Omaha.....Omaha Rubber Co.
Chattanooga.....Sanford Bros.
Dallas.....Fisk Co. of Texas.
Denver.....Auto Equipment Co.

Of extreme interest to every motorist

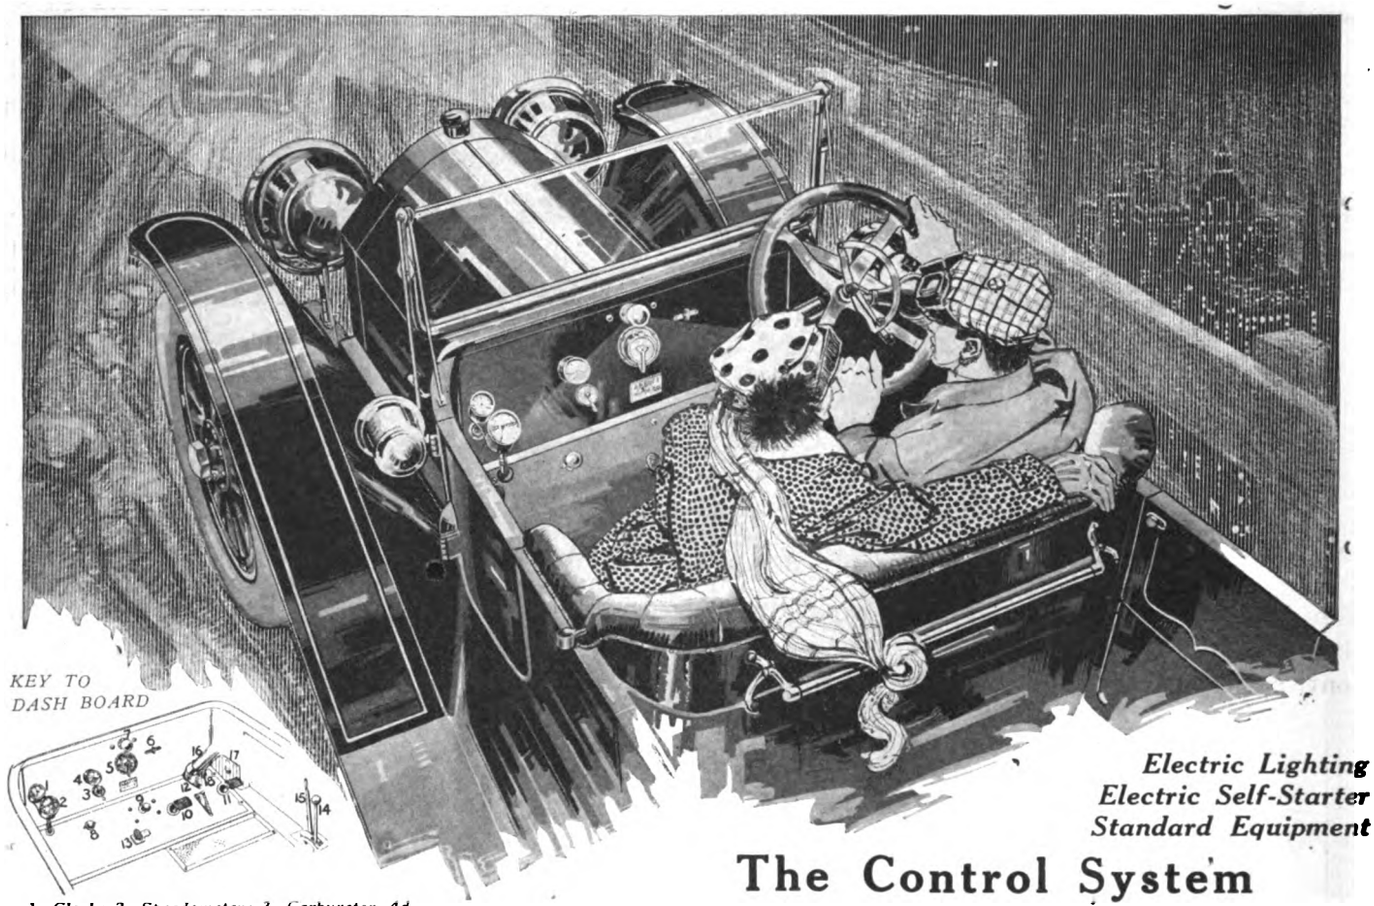
THE Automatic Spark Advance feature of the Type "K" Atwater Kent System is a long stride forward in ignition practice.

With this device, the control of the spark timing is entirely automatic (although the hand lever can be used if desired). This means that the spark is always properly timed to get the greatest possible power from the motor at any speed from three to seventy miles per hour.

No human mind can follow accurately the speed variations in an automobile motor and accordingly regulate the spark setting to get the best results.

The automatic spark control of the Atwater Kent System is more than human in its performance—it is sensitive to the slightest variation in speed—immediate in its response and positive in its action. The operator can forget his spark lever, knowing that his spark is being better regulated than he can do it himself.

The increased safety due to the automatic retarding of the spark for starting is alone more than sufficient to commend it to the modern motorist.



The Type "K" System is especially adapted for use in conjunction with lighting and starting equipment, or as sole ignition in place of the high-tension magneto. We regard it as being fully up to the high standard of merit for which Atwater Kent equipment is known.

Interesting Booklet D and detailed information sent upon request.

Electric Lighting
Electric Self-Starter
Standard Equipment

The Control System

NO motor cars have more attractive and utilitarian dash boards than the new Abbott-Detroit models.

Every convenience necessary for the **complete control** of the car is at hand. Nothing is left out.

There is even an electric light for illuminating the dash board at night.

THE ELECTRIC SELF-STARTER

The Abbott-Detroit electric self-starter consists of an electric motor built in the side of the crank case and connected with the crank shaft through an independent train of gears enclosed in timing gear compartment of crank case, this construction insuring perfect lubrication.

It is controlled by means of a button on the toe board.

In operation it is simple, positive and reliable—a lady or child can operate it.

As soon as the gasoline motor starts, an over running roller clutch releases these gears and they remain idle while the gasoline motor is running.

This self-starter is not an experiment, not an attempted combination of ignition, lighting and starting, but a real, dependable self-starter, built as a part of the engine and included in the regular equipment.

Call at one of our salesrooms and ask to have its operation explained.

"The demand of the day is that an organization shall be judged by its product and not by what it claims for itself."

Abbott-Detroit advertising for 1913 will be printed in serial form.

This is the fifth of the series. The sixth will appear in the Saturday Evening Post, Dec. 21st; Collier's, Dec. 14th; Life, Dec. 26th; Literary Digest, Dec. 7th.

Copies of previous advertisements sent on request.

ELECTRIC LIGHTING SYSTEM

The electric lighting system is equally complete.

The current is generated by means of a dynamo operated from the engine, and a large capacity lighting battery is provided which takes care of the lights when the motor is standing still.

Thus a sufficient amount of current is always available for lighting all the lamps brilliantly.

A switch on the dash board makes it possible to light all the lamps except the tail lamp from the driver's seat.

The tail light is electrically lighted and is controlled by independent switch integral with it.

An ammeter shows at all times the amount of electric current produced and used. An automatic switch prevents the discharge of the battery through the dynamo when the engine is idle.

Two large black enameled, nickel trimmed electric head lights, two electric side and tail lamps, fitted with Tungsten globes, an Extension auxiliary light which can be used for examining the motor or interior of the car, a dash light for lighting the speedometer, clock, ammeter and other fittings on the dash and foot board, complete the electrical equipment.

CLOCK AND SPEEDOMETER SET

Mounted securely on the extreme left hand side of the dash is a clock and speedometer set which accurately indicates time, speed and total mileage covered.

To the right of this, on the other side of the ammeter, is a carburetor adjustment device.

In addition to the starting button, the foot board carries the muffler cut-out and accelerator throttle pedal. Two large pedals, one operating the clutch and the other the service brakes, are located on either side of the steering column.

Let our dealers show you these cars, or write for advance catalog.

COMPLETELY EQUIPPED EMPIRE

—and Now You Get *Class* for $950

Thousands are in the market for a five passenger touring car of moderate size and price. They have avoided buying the average small car because of its usual unsightly appearance and its entire lack of dignity and style. But here is a car that is winning them all—a car not too large yet magnificent in appearance, a car low in price yet with character and dignity heretofore only found in cars of the **five thousand dollar class.**

Empire—"The Little Aristocrat"

THE $950.00, fully equipped Empire 5-passenger Touring Car is daily winning hundreds of this intelligent cultured class. "The Little Aristocrat" has commended itself to these purchasers because of its efficiency, its quality construction, its low maintenance cost, and the refined elegance of its appearance. It will appeal mightily to **you** if you want a car of moderate price and size; **particularly if you demand a real car** instead of an imitation, **and the beautiful** instead of the unattractive.

A year ago there were two thousand Empires in use. Six months ago we planned for our usual healthy increase. But even **we** underestimated the merit and popular appeal of the five-passenger Empire Touring Car. So. early in September **we were forced to establish a second factory** and to triple our output.

Examine "The Little Aristocrat" five-passenger Empire Touring Car and you will understand this amazing growth and success. Judge it from every angle. **Compare the Empire with cars at any price for beauty of design.** The body lines are clean-cut, with flush sides and straight rail. The dash and cowl are of one solid piece of aluminoid steel. **The free running board, graceful fenders and big artillery wheels with big hubs and hub caps lend it distinction.** Large commodious doors, wide seats with luxurious deep cushions assure thorough comfort for five passengers.

Thoroughbred speed, surplus power for any hill, and unusual strength is apparent in every detail of the chassis. Consider the 17-inch steering wheel as against the average small car type of 15-inch. Ponder the safety margin and insurance against accidents in steering knuckles, axles and brakes as big and strong as those used in cars with double its weight. Think of the Empire's 9-inch disc type clutch in place of the customary 5-inch type.

The Empire is sold completely equipped with Mohair Top and envelope, Windshield, Prest-O-Lite tank and Speedometer.

Look up the Empire. Ride in it. Complete information in our Empire "Little Aristocrat" folder. Write for it.

EFFICIENCY DETAILS

Unit Power Plant—Long stroke motor. Cylinders cast in pairs. Valves individually enclosed.
Clutch—9-inch multiple disc (raybestos lined) type.
Transmission—Selective type. Three speeds forward and reverse. Mounted on annular bearings throughout.
Cooling System—Thermo-syphon. Big radiator in conjunction with belt driven fan.
Valves—High carbon valves, fully inclosed, noiseless.
Lubrication—Constant level, force feed.
Ignition—High tension magneto. Set spark.
Steering Gear—Full worm gear type. Irreversible.
Control—Single lever, center control.
Brakes—Service internal expanding; Emergency, external contracting.

Dealers

No need to tell you about the demand for a quality five passenger touring car designed on artistic Empire lines and selling at $950.00. You know the unlimited opportunities in that direction.

Perhaps you do not know how broad a dealer's proposition we make. You ought to.

Write or wire us for information. There is still some open territory.

EFFICIENCY DETAILS

Rear Axle—High-grade construction, with Hyatt roller bearings throughout. Three-quarter floating.
Front Axle—I-beam section drop forged.
Springs—Oil tempered. Three-quarter elliptic rear, semi-elliptic front.
Wheels—Artillery type, 32" Q. D. rims.
Frame—Pressed steel, channel section, dropped, giving low center of gravity.
Body—Aluminoid steel, wood trimmed, four doors, full vestibule, seats with luxuriously buffed leather cushions.
Gasoline Tank—Capacity 12 gallons.
Full Equipped. Equipment includes Mohair Top. Top Envelope, Windshield, Speedometer, Prest-O-Lite Gas Tank, Horn, and Complete Tool Equipment.

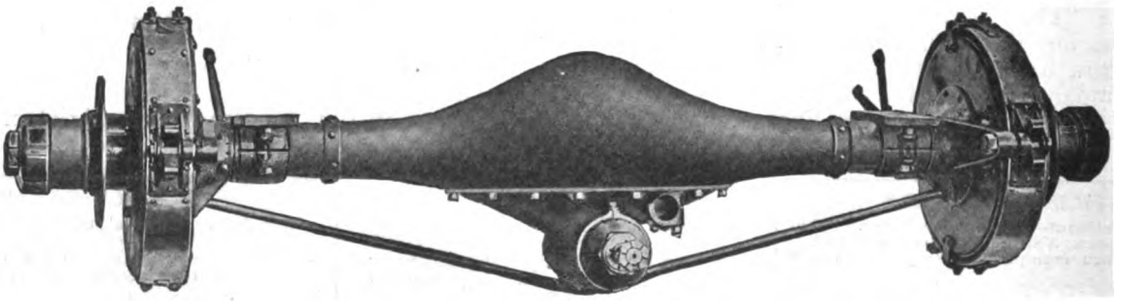
American Axles

American

Give the maximum of efficiency, with the option of bevel or worm drive

Axle efficiency is the basis by which you must measure your car's maintenance expense.

This is especially true of electric vehicles which leave the garage with a fixed quantity of stored energy.



Every unnecessary ounce of friction that must be overcome must be paid for in current.

American Axles, because of their distinctive, patented features—which make for easiest running—assure the maximum of mileage from your batteries.

It is false economy for you to disregard this most important and practical feature.

American Axles now include the Lanchester-Daimler Worm Gear, to which we hold the exclusive rights as axle manufacturers in this country, through the Warner Gear Co., of Muncie, Ind.

They are made with the same superb degree of refinement that characterizes our Bevel Drive axles, well known as the first to be used in electric cars.

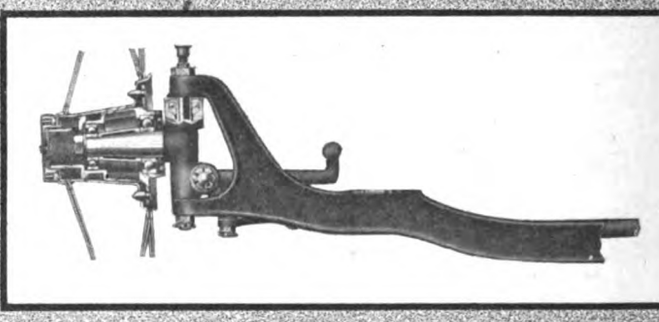
McCUE WI

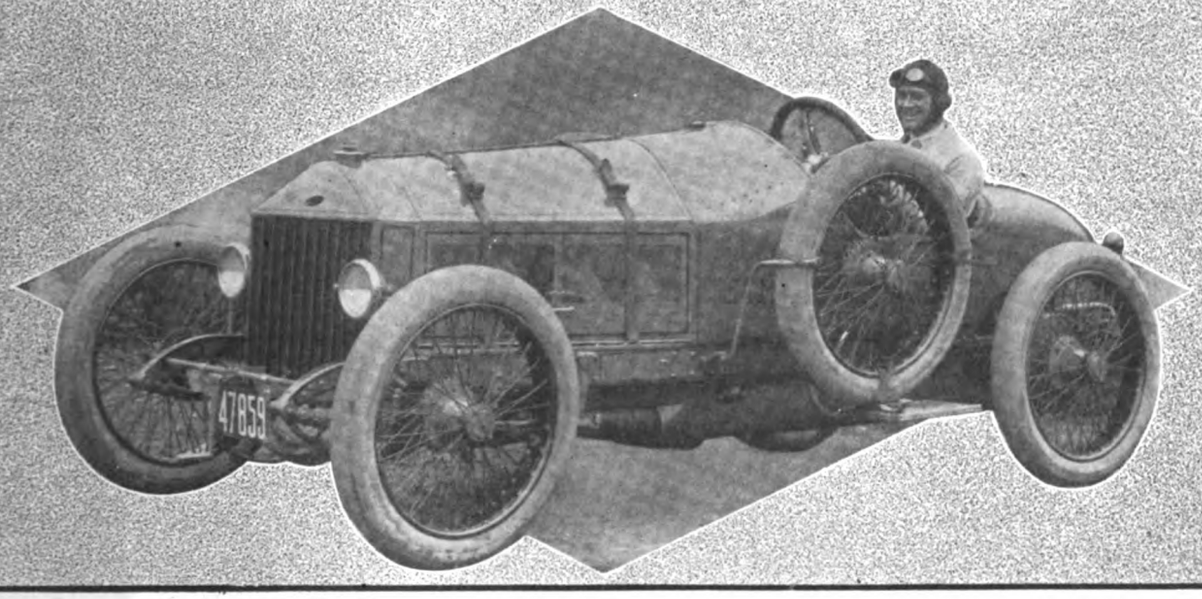


Don't Kid Yourselves, Dealers and Makers

Wire wheels are here to stay just as certainly as you are making and selling cars. You can talk against them all you want or argue anyway you want but the cold, bare facts remain that wire wheels are here to stay. The only question you have to consider regarding the use of wire wheels is whether you will be a leader and equip the product you handle now or whether you will come trailing along after the other fellows have set the pace. That's the only point there is for you, gentlemen, either or both of you, to consider.

We Can Make Immediate Deliveries

Our plant is now equipped to enable immediate deliveries on wire wheels. No manufacturer will be held up one minute who wants to change over to wire wheels tomorrow. And not only can we make immediate deliveries but we can take care of quantity contracts of any size and of whatever delivery dates the manufacturer may elect. This applies not only to those cars which use McCue axles but to cars using any type or style of axle manufactured.



McCUE

Digitized by Google

RE WHEELS

HERE IS SOME WEIGHTY EVIDENCE

The recent performance of the Stutz and Mercer cars in going through the Vanderbilt and Grand Prix races with great honor and without one single blow out, of course, is helping to make more converts to wire wheels. In this same connection the performance of the Kline Kar stock racer, "Jimmie," illustrated below, is doing its share to win the people over to wire wheels. This Kline Kar, in Pittsburgh, in classy style "cleaned up" a bunch of professional talent who expected to win everything.

A WINNING COMBINATION

The combination of McCue wire wheels and McCue axles means to the car manufacturer the most up-to-date equipment that money and brains can produce. McCue detachable wire wheels are more easily mounted and demounted than demountable rims and besides they dispense with the tire killing properties which all demountable rims possess—extreme weight at the periphery.

For more information about wire wheels, send for our booklet, "Mileage Plus."

Old Jack Frost

Is packing up his assortment of Cold Weather and is just about ready to pay us a visit

All you have to do is remind your customers of this fact and there will be a brisk sale of **ELECTRIC WARM HAND WHEELS** And don't forget one sale will send many others — sort of an endless chain while the cold weather lasts

One Warm Hand Wheel will sell another. Two will sell four—and so this endless chain of sales will keep up until practically every driver in your territory who handles a car for pleasure or business in the winter months, will equip with this sensible steering equipment.

Maybe it will not look as good to him during the days of October as it will around November first, but the fact remains that **you should have a demonstrating device on your car—NOW.**

The Warm Hand Wheel is of service for six or seven months of the year—there is nothing to wear out about it and so it will last for years—it is a logical, comfort-giving necessity that will keep the hands warm while steering, no matter what conditions of temperature may exist.

The Warm Hand Wheel is easily installed, retails for $15 and offers you a liberal commission on every sale. Every driver who suffers from cold, stiff fingers and so runs grave risks, will get the "Warm Hand" idea and adopt it.

Every moment counts now. The opening of the season is right at hand and you owe it to yourself as a business man to at least investigate this proposition and see what there is in it for you. Don't delay but write today while this matter is fresh in your mind.

Glide

In 1917—Five Years Hence

the 1913 GLIDE will still be a **modern**, serviceable car. Why? Because the present GLIDE leaves but very little that can possibly be improved upon.

It is far ahead of many 1913 cars—and **no** car is **leading** the GLIDE in high-class materials, construction and all of the newest equipment.

The 1913 GLIDE is **electric lighted**—simply turn a button and all lamps are on!

The GLIDE Motor-Driven Tire Pump eliminates drudgery. Also **saves your tires** by keeping them fully inflated at all times to any desired pressure.

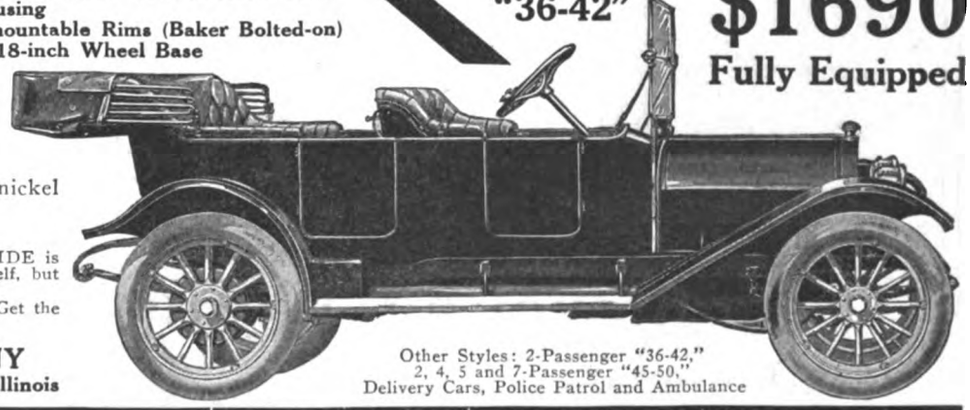
Electric **Bull's Eye** Side Lamps are **sunk in dash**, eliminating rattling, minimizing breakage and adding to the classy appearance.

The GLIDE Self-Starter is **sure** of a spark—**investigate** and learn **why** the GLIDE starter is **efficient.**

Simple center control, left side drive, demountable rims, irreversible steering gear—and in fact all the newest features of known worth—establish the "class" of the 1913 GLIDE.

Make a memo—right now—to write us for detailed description of the entire GLIDE line.

"36-42" Features



Automatic Dynamo Lighting System
Motor-Driven Tire Pump
Unit Power Plant
Long Stroke Motor with *enclosed valves*
Center control
Left Side Drive
Bull's Eye* Electric Side Lamps *Sunk in Dash
Electric Headlights and Tail Lamp
An *Efficient* Self-Starter
Floating Rear Axle with Pressed Steel Housing
Demountable Rims (Baker Bolted-on)
118-inch Wheel Base

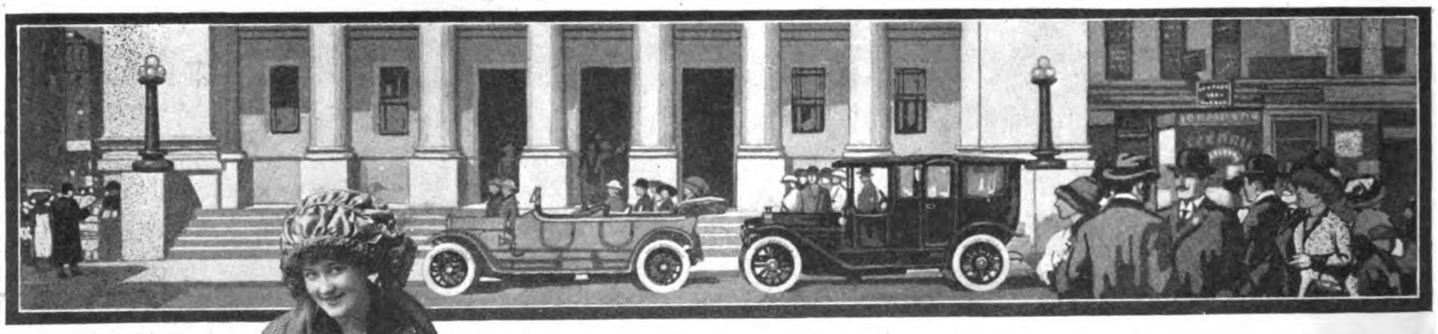
You can't get GLIDE quality, equipment and service in any other car at the GLIDE price. Make us prove it! You can pay **more** and get **less.**

Our price includes complete equipment, as follows: Dynamo, Mechanical Tire Pump, Self-Starter, Mohair Top, Top Boot, Glass Front, Electric Headlights, Side Lamps and Tail Lamp, Demountable Rims and One Spare Rim, Model B Stewart Speedometer with Grade Indicator, Spare Tire Carrier. Full quota of tools and jack, all nickel trimmings.

5-Passenger "36-42"

$1690
Fully Equipped

Other Styles: 2-Passenger "36-42," 2, 4, 5 and 7-Passenger "45-50," Delivery Cars, Police Patrol and Ambulance



Dealers

The extraordinary quality and equipment of the GLIDE is apparent to the most experienced. It not only sells itself, but every car sells others.

Write for our attractive Dealer's proposition today. Get the GLIDE agency **now**, while there is still open territory.

Kelly-Springfield
Automobile Tires

As a matter of fact, dependable tires are the basis of real automobile usefulness.

Kelly-Springfield road mileage is a few thousand miles higher than the average. That reduces the cost of the tire.

The easy resiliency of Kelly-Springfield Tires is one phase of our argument. But staunchness and durability, born of the best rubber composition, skill and the incentive to make good tires better, offer a reason even more convincing—wear.

When you buy Kelly-Springfield Tires you are not experimenting. We have done that for you.

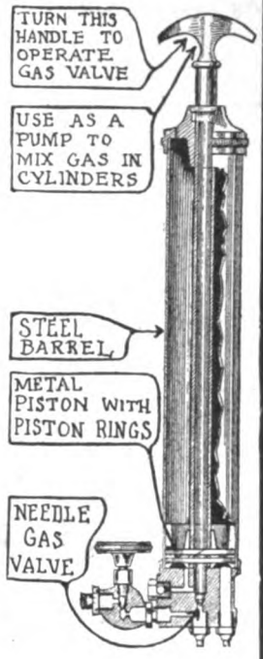
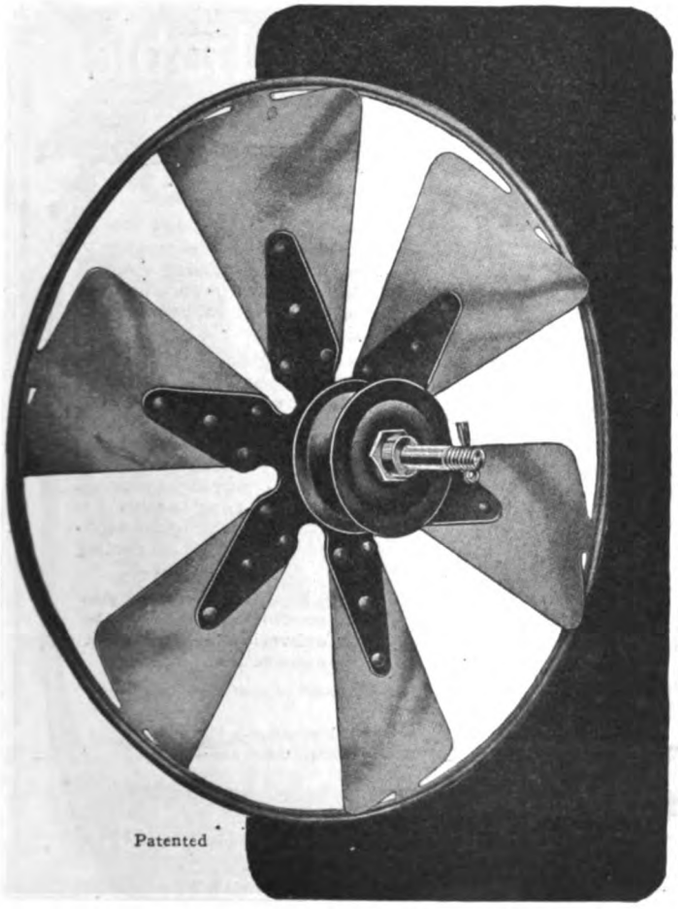
The Niagara Self-Starter



is guaranteed for two years and will start your car every time you get a spark in your cylinder.



The Niagara Self Starter maintains its popularity and increased demand solely on its merits as an efficient self starter. It is as simple as it is efficient. It does not use the **Gas** alone, which will soot your spark plugs, but mixes the gas with **Pure Air** which is forced into the cylinders

The NIAGARA SELF STARTER has a compressor made of seamless drawn steel tubing with a cast iron piston and two cast iron piston rings—a distinct improvement on the old leather plungers which wear out under the influence of the acetylene gas. Durable, efficient and reliable. It never wears out, has no maintenance expense, and is always on the job.

FACTORIES and AGENTS should write us for our proposition.

NIAGARA SALES CO., Buffalo, New York

Better Fans

Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

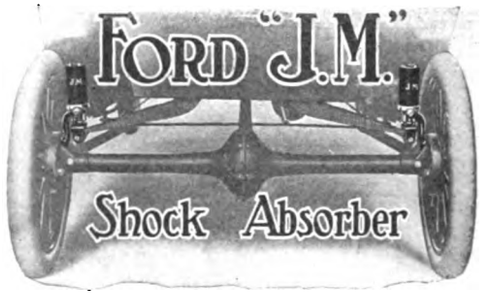
Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)



will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

Price $1.00 Each

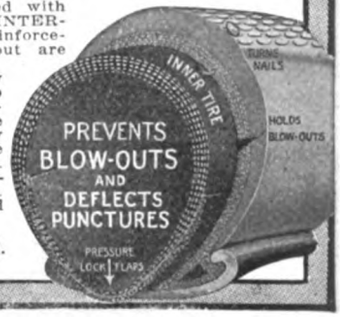
INTERLOCK
INNER TIRES
Stop Tire Troubles

INVESTIGATE AND LEARN WHY SO MANY THOUSANDS OF MOTORISTS ARE DISCARDING INNER SHOES, RELINERS, FILLERS, AND OTHER MAKESHIFTS FOR INTERLOCK INNER TIRES—AND WHY INTERLOCKS ARE HANDLED AND RECOMMENDED BY THE BEST SUPPLY DEALERS AND TIRE HOUSES ALL OVER THE COUNTRY.

One weak point of the automobile to-day is that you can't depend on its tires. INTERLOCKS revolutionize this condition by making your tires so strong that blowouts become practically impossible. INTERLOCKS save half your tire expense—save repair bills—double your mileage—prevent punctures and completely free you from all fear of tire trouble.

What INTERLOCKS Are.—The INTERLOCK is a complete inner tire (not an inner shoe) which is placed between the outer casing and the inner tube to strengthen the outer casing and protect the tube. It is the only reinforcement which is locked by air pressure to the rim and which becomes an integral part of the tires, and, therefore, cannot heat or chafe. Even if the tire is broken the INTERLOCK will hold.



INTERLOCKS Insure Safety.—You know that the sudden blowing out of a tire may easily ditch any car when going at fair speed—the safety of INTERLOCKS should appeal to you.

Reduce Your Tire Expense.—You can have the tires on your new car equipped with INTERLOCKS if you specify them. INTERLOCKS are the only perfect tire reinforcement. They cost a little more but are cheapest in the long run.

For your present car—ask any dealer or supply house, or write to us for the name of your nearest supply source. INTERLOCKS will make any fairly sound tire more than carry you through the season. They are easily placed and are made in all sizes.

We Want Dealers Everywhere.—Write for Special 30 Day Offer, Booklets, Prices, Records of Road Tests and Testimonials of users.

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Wire or write us, no matter where you are.

Our PRICES compete with LEADING AMERICAN makes.

We also make Duplex and Raymond Brakes and Gyrex, the Mixer.

Standard Universal Rims

fit any style or make of tires. The side rings are reversible, they curve outward on one side to fit a straight side tire, inward on the other to accommodate a clincher. Two turns of a nut unlocks the rim for demounting, two more turns locks the rim in place. Write for catalog 607, which explains fully.

PERFECT LUBRICATION and the elimination of noise are two features exclusive in HYATT ROLLER BEARINGS. The hollow, tubular roller becomes a reservoir for the lubricant.

FLEXIBILITY IS IMPOSSIBLE in solid rollers or balls. It's essential though, in reducing the noise in bearings. Hyatt Flexible Rollers absorb vibrations and cushion shocks.

If You Need Motor Lamps
You Need This Catalog
We want you to write for the Solar Catalog before you decide on your motor lamps, for this is the most complete line of lamps on the market. Solar Lamps have been preferred by most motorists for the past fourteen years because of their brilliancy, their style, their strength and their several exclusive advantages —their special short focus lead glass lens mirror reflectors—the patented double ray light projection (in the Solarclipse), giving two distinct fields of light, for city and country use—the new black finish, the only such finish that's proof against heat and moisture—and other features that other lamps lack.
To fail to see Solars before you buy is to fail to include in your consideration the very finest lamps in existence. Solars are made for oil, electricity, gas and in combination, for pleasure cars, motor trucks, carriages, motor boats and airships. Write for catalog now—while you think of it. (136)

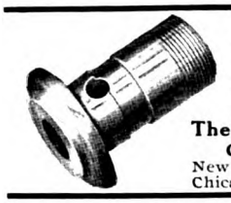
Weed Chains
The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.



Cannot Injure Tires
Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

FIAT

Racing Lessons

Fiat has won more great racing victories than any other automobile—yet it is in no sense an exclusive racing car.

The lessons learned from these clean-cut victories in speed and endurance on track and road have been two-fold.

1st. They have proven, as no other medium could prove, the correctness of **Fiat** Design, the strength of **Fiat** Materials, and the thoroughness of **Fiat** Construction.

2nd. They have demonstrated to the world that the famous Italian **Fiat** engineers are unequaled in the solution of any motor car problem.

The stresses and strains of a hard road race or endurance contest are many times greater than would be met in years of average touring over roughest roads. The cars produced by F·I·A·T at Turin and Poughkeepsie are the final expression of these racing tests as applied to every-day uses.

Fiat, With its Marked Superiorities, is Now Sold at American Prices. Investigation Will Reveal to Dealers a Most Attractive Business Proposition

A Snow-and-Ice Tire Tread

You have wanted a better traction device to give your tires a grip in snow and on ice.

You have formerly used chains—under protest. They are unhandy, noisy, short-lived, expensive.

You would like to get the results without the added cost of chains. If you found something that saved more than its cost by REDUCING tire wear (instead of increasing it), you would think mighty hard before turning it down.

Here It Is →

the tried and proven WOODWORTH TREAD, with an added series of high rivets to give a grip on ice and in deep snow. These rivets, like the regular ones, are glass-hard. They are deeply cupped, to give sharp edges even when worn. They are set staggered about 2 inches apart, all around the tread.

The rest of the tread is the same as before. Same waterproof, always pliable chrome leather base; same side springs to prevent loosening and chafing; same rows of hardened rivets between the special high rivets.

Just put the Double Grip Treads on your tires and leave them on all winter! They give traction anywhere, and you are saved the nuisance of putting on and taking off chains.

Save your tires, your purse, and your car by using the new

Double Grip Woodworth Treads

Triplex

Prevents Back Firing

Triplex

Readiest Seller on the Market

A Dirty Motor Is a Short Lived Motor

Nothing tends to lower the efficiency, flexibility and sweet running qualities of a motor quicker than an improper mixture. Faulty carburetion is the prime cause of carbonization. Carbon clogged cylinders, sooty spark plugs, sap the ambition out of a motor, shorten its service.

Loss of COMPRESSION is caused from DIRT taken into cylinders through CARBURETOR. The TRIPLEX MAKES IT AN IMPOSSIBILITY for ROAD DIRT to get into the cylinders. DIRT OR DUST acts as a grinding material and causes loss of compression by grinding down PISTON, RINGS, AND PITTING OF VALVES.

The Triplex Makes Imperfect Carburetion a Mechanical Impossibility

The TRIPLEX is a device placed between the MANIFOLD AND CARBURETOR TO BREAK UP the mixture—the fuel.

The TRIPLEX will EQUALIZE the most UNEVEN mixture that leaves the carburetor—make it uniform throughout.

Operating as it does on a tried and proven scientific principle, the TRIPLEX insures a mixture which will burn CLEAN to the last atom. It is a physical impossibility for a bit of live gas to remain unignited. BLACK SMOKE is emphatically done away with—CARBONIZATION forestalled.

A TRIPLEX WILL PAY FOR ITSELF IN TWO MONTHS. By utilizing every drop of gasoline to its full capacity, the TRIPLEX makes a saving of over 25% per gallon. It gives you 5 gallons of FUEL at a cost of FOUR. It makes high-proof gasoline out of low.

Furthermore, it increases power proportionately. The full cylinder charge is ignited every time—the maximum power delivered at the point of highest efficiency. Because there is no fuel waste, there is no power waste. A TRIPLEX is a double economy—it INCREASES power at the same time it DECREASES fuel consumption.

INSURE YOURSELF AGAINST BACK-FIRING WITH A TRIPLEX. Another advantage it possesses is that it prevents FIRING a car due to the fact that any FLAME is cut off in trying to go through the TRIPLEX. The principle is the same as the non-explosive feature of a miner's gauze lamp.

Further advantages are that a TRIPLEX makes starting easier regardless of temperature or atmospheric conditions, and stops suction of live gasoline when the motor is cold.

The TRIPLEX can be readily attached by anyone in one-half hour's time.

THE TRIPLEX IS GUARANTEED. The TRIPLEX is guaranteed to do all we claim for it, or your money back. Therein lies YOUR protection. For further information write us.

Talks *on* Selling Automobiles

No. 2

Analyze your good-will.

You will find a certain percentage has automobile-buying surplus capital behind it, more has not.

The first makes the wheels of your business go round. But the surplus-capitaless kind, like an empty gasoline tank, gets you nowhere.

If you could extend credit—if only to business and professional men who need cars as practical working assets, can afford them and would meet their obligations—you could capitalize almost 100 per cent. of your good-will and do double the business. But you can not do a credit business. Not in the automobile trade where every transaction means $500 or more.

Right here we step in. Our business is financing sales of automobiles of all kinds to responsible people who can afford them but lack ready money. People who are in pretty much the same position you are in, having their funds tied up as active capital.

Your commission, and the cash for the manufacturer, are paid on delivery of the car. And the customer remits to us under the easy payment plan, with legal interest—not "installment house" rates.

You assume no risk. And we only extend Credit Where Credit is Due.

Write today for details of how we can help you capitalize the rest of your good-will and double your sales.

"The Car of Quality"

Kline Kar Model 6-60, Touring, $3500

DEALERS

YOUR experience with other cars should tell you that it does not pay to handle a line that constantly worries the life out of you with complaints from the user, who has trouble with the machine. This user knows now that he is better off when he buys a car of quality in the first place, even though he must pay a little more for it, and he will soon begin to demand such a car of his dealer.

It is up to you to have the car in your line when he calls. The Kline Kar will answer all the requirements this prospect may impose and more.

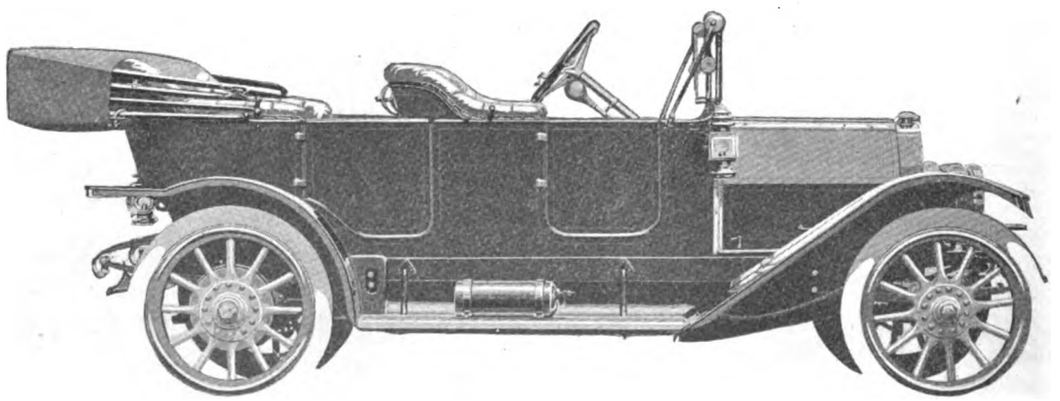
High-priced feature No. 1

Popular-priced makers consider semi-floating rear axles well enough. We do not. Overland Model 69T axles must be better—*THREE-QUARTER FLOATING.*



The Overland three-quarter floating axle causes the weight of the car and its load to rest on the axle housing—reinforced by an inner steel tube, riveted and keyed to the housing.

Advantage?

In the ordinary semi-floating axle the weight of the car and its load is carried half and half on the axle shafts and housing. Hence, the axle not only does the wheel driving, but must carry, also, part of the great weight. Result—excessive strain and friction, most surely causing disalignment of bearings. More repair expense.

High-priced features in a low-priced car. This is one of the features that make the Overland the greatest value in the world. Let us send you a catalog which explains in detail the many other high priced features. Please address Dept. 50.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, October 31, 1912 No. 6

FIRESTONE STRENGTHENS DEFENSE IN RIM SUITS

Granted Permission to File Supplementary Answer—Split Ring Among Inventions Involved—Charges United With Bad Faith.

In an effort to strengthen its defense in three actions brought against it for alleged patent infringement which have been pending for two years in the United States District Court for the Southern District of New York, the Firestone Tire & Rubber Co. of New York on Tuesday last, 29th inst., secured permission to file a supplementary answer to the complainants, the United Rim Co., of Akron, O., which answer will include a list of foreign patents alleged to aid in establishing cases of the prior art. The cases originally were filed June 8, 1910, and meanwhile considerable evidence has been gathered abroad which will enter into the suits when they come to trial.

The patents involved are Nos. 816,884, granted April 3, 1906, to Charles S. Scott; 832,170, granted October 2, 1906, to Edwin C. Shaw, and 910,869, granted January 6, 1909, also to Shaw. The first covers the split retaining rings for quick detachable tires, the second covers a tool used in drawing the rings together, and the third applies to the slotted "keepers" employed to keep the ring in position. They passed through various hands from the time of their conception, and after being granted by the Patent Office were transferred at various dates to the present holder, the United Rim Co. At the time they were issued they were assigned to the Goodyear Tire & Rubber Co., which later transferred them to the United Rim Co., which acquired rights held by the Goodyear and several other tire companies.

The United company claims the usual things asked in patent litigation and requests injunctions, an accounting and damages. The Firestone company sets up anticipation as one of its defenses, in proof citing patents that range from Renard's wheel of October 22, 1901, to a wheel by Midgley, patented July 5, 1904, as evidence that the split ring lacked novelty, and in the case of the tire tool cites Frost's belt stretcher, patented November 14, 1882, and Knep's watchmakers' pliers, patented October 3, 1893, among others.

In addition to these defenses the Firestone company charges lack of good faith in three suits. It alleges and charges that the United Rim Co. "was organized and created for the unlawful purpose of obtaining the control of the production and marketing of certain automobile parts and accessories and to control and restrict such production in defiance of the public's needs and requirements . . . and for the further purpose of harassing and annoying the defendant, frightening its customers in an attempt to compel them to purchase such articles from the complainant."

Fisk Becomes $10,000,000 Corporation.

Heretofore a $4,000,000 Delaware corporation, the Fisk Rubber Co., of Chicopee Falls, Mass., last week reincorporated, under the laws of Massachusetts, with an authorized capital of $10,000,000. While the increase of capitalization implies a considerable expansion of the Fisk business, the exact meaning of the change is not yet public property. The Fisk people themselves state that at this time they are not prepared to say anything whatsoever regarding it.

Ill Health Parts Wheeler and Schebler.

Because of ill health, George A. Schebler, the inventor of the carburetter which bears his name, has retired from the Wheeler & Schebler Co., of Indianapolis. Schebler's withdrawal leaves F. H. Wheeler in sole control of the company, which, as a matter of fact, he has dominated at all times since its organization.

CANFIELD PATENT DECLARED NOT BASIC

Federal Court Decides It Does Not Control Modern Spark Plugs—Lapses Also Constitute "Fatal Bar."

Admitting that Frank P. Canfield, who died more than 10 years ago, contributed to the development of the spark plug, Judge Mayer, in the United States District Court for the Southern District of New York, on Monday last, 28th inst., denied to him credit for the invention of spark plugs of to-day, and specifically the spark plugs characterized by a deep recess around th electrodes, which is the type which is in practically general use.

As the Canfield patent, No. 612,701, dated October 18, 1898, was believed by those to whom it was assigned, to control such plugs, Judge Mayer's decision upsets this belief and frees from the suspicion or charge of infringement all manufacturers who are engaged in the manufacture of deeply recessed and all other modern plugs.

Judge Mayer's ruling was rendered in the case of A. R. Mosler & Co., of New York, against John Lurie, of New York, trading as the Auto Supply Co. As a matter of fact, however, Lurie was merely a nominal defendant, as it is generally understood that the burden of his defense was borne by C. A. Mezger and the Rajah Auto Supply Co., whose plugs had been handled by Lurie.

The patent was acquired about 1906 by the now defunct Association of Licensed Automobile Manufacturers at the time it was engaged in the acquirement of rights which were supposed to be of a basic or far-reaching nature. It was duly conveyed to the Association Patents Co., which was an outgrowth of the A. L. A. M., which company, in 1909, disposed of it to Mosler

Digitized by Google

& Co., the terms of the sale protecting A. L. A. M. members from prosecution. In due course, Mosler & Co. instituted suit against Lurie and the outcome of the litigation has been awaited with no little interest, the Canfield claim to the deeply recessed plug affecting practically every spark plug manufacturer in the country.

In deciding the suit, Judge Mayer held that "the patent is sustained within the limits here indicated and it is held that there is no infringement," which, according to those most concerned, is interpreted as meaning that the Canfield rights are limited strictly to the plug described and illustrated by the letters patent, which plug—a large, cumbersome one as compared with present types—was formed integral with the head of

(Continued on page 37.)

Flanders Deal Far from Consummation.

While the negotiations are well advanced, it is by no means certain, as has been made appear, that Walter E. Flanders will become either president of general manager of the reorganized United States Motor Co., or that the latter corporation will absorb the Flanders Motor Co., even if it takes over Flanders himself. The negotiations depend largely upon the result of the examination of the Flanders company which is now in progress, and which is being conducted by the New York accounting firm, Price, Waterhouse & Co., who are acting, of course, in the interests of those who have the reorganization of the United States Motor Co. in hand. At best, it will be more than a month before the United States Motor receivers are discharged and, until that time at least, it will not be possible for the reorganized company legally to enter into a contract with Flanders or anyone else.

Quarrelling Partners Near Settlement.

Judgment for an accounting was rendered late last week in the Supreme Court for New York County in favor of Cornelius F. Jackson, who brought suit against Clarence A. Glentworth, following a five and one-half months' partnership of the two in Glenworth's business as importer of Napier cars at 103 West 57th street. The dispute between the two men, as was related in Motor World at the time the action was instituted, was due to Jackson's claim that he put money into the business, but later received it back, and then practically was "frozen out" when there was coming to him $3,300 in profits. Glentworth opposed the claims, and when Jackson asked for a receiver Glentworth himself was appointed. Glentworth denied that Jackson was entitled to the profits claimed. He claimed instead that Jackson never sold a car while with the company and had received all he was entitled to.

BENZ WANTS MONEY BACK; SETS UP CHARGE OF FRAUD

Claims Misrepresentation Induced Purchase of American Agency—Files Seven Suits Against Froelich and the Weingartens.

Claiming that fraud was perpetrated when the Benz Auto Import Co. of America was sold last spring by Jesse Froelich and David and Oscar Weingarten to the parent company, Benz & Cie, of Mannheim, Germany, the latter and its New York importing house are suing Froelich and the Weingartens in the Supreme Court for New York county. Seven different actions, filed late last week, are required to cover all phases of the proceedings, in which the sum of $160,000 is involved. The German company itself is the complainant in two suits; the other five are brought in the name of the New York corporation.

As gathered from the complaints and other sources, the plaintiffs allege high financing of an exceedingly lofty nature on the part of the defendants. In 1909 it appears that Froelich, who was a part of the Times Square Automobile Co., and the Weingartens, who are wealthy corset manufacturers, formed the Benz Auto Import Co. of America in New York City with an authorized capitalization of $100,000, the three taking up 55 per cent. of the stock. For some not clearly stated reason, this company was dissolved in 1911 and its assets and liabilities taken over by another corporation of the same name, which was formed with the same men, same capital and same division of stock, the three exchanging their old stock for shares in the new company.

During 1911, according to the plaintiffs, whose complaints are voluminous, and immediately following the formation of the second Benz importing house, Froelich visited Mannheim and showed to Benz & Cie. a statement of the condition of the New York house, representing, it is claimed, that the American agency was in fine condition, was well thought of, had a good credit, and a surplus of $30,000, and was on the road to prosperity. The representations so pleased the Benz principals that when Froelich offered to sell they agreed to buy. They contracted to purchase the outstanding 55 per cent. of stock for about half price and to pay a loan of $84,000 made to the New York company by the Weingartens, it being represented that this money existed in tangible assets. Full of hope and faith, the Germans paid over close to $107,000.

At the time of the deal there appears to have been 45 per cent. of the stock in the treasury, and Benz & Co. claim that Froelich and the Weingartens, having sold their 55 per cent. to the Germans, issued the remaining 45 per cent. to themselves and, through some oversight, forgot to pay for it. However, the Benz interests sent over representatives to take charge of the prosperous agency, and there immediately went up a cry of protest that culminated in the present actions.

The Germans claim that, instead of finding a surplus of $30,000, they found a deficiency of some $35,000, making a difference from the representation of about $65,000. They also allege that the business was not in the condition pictured to them and, instead, was on the way to become a wreck. They moreover assert that when Froelich saw fit to retire he took with him $7,500 in cash and $7,250 in the form of two chassis. The $7,500 he is said to claim as commission from the parent company on the stock sale, but Benz & Co. declare that if such was the case the $7,500 was taken from the wrong treasury.

The seven actions instituted are as follows:

Benz, of New York, vs. Froelich—To recover the $7,500 alleged to have been taken from it under the so-called commission deal.

Benz, of New York, vs. Froelich—To recover $7,250, the price of two chassis.

Benz, of Germany, vs. Froelich—To rescind the purchase of Froelich's share of the 55 per cent. of stock and to compel the return of $7,500 paid therefor.

Benz, of New York, vs. Froelich—To recover $22,500 worth of stock issued to himself and not paid for.

Benz, of New York, vs. Oscar Weingarten—To recover $11,250 worth of stock issued to himself and not paid for.

Same case against David Weingarten.

Benz, of Germany, vs. David and Oscar Weingarten—To recover the price paid for the Weingartens' share of the 55 per cent. of stock and also the $84,000 loan, a total of $99,000.

Lee Tires for the Pacific Coast.

The Chanslor & Lyon Co. has been appointed Pacific Coast representative of the Lee Tire & Rubber Co., of Conshohocken, Pa. Lee tires will be distributed from the Chanslor-Lyon branches in San Francisco, Los Angeles, Fresno, Portland, Seattle and Spokane.

Blagden Receiver for Daimler Import.

Arthur W. Blagden has been appointed receiver for the Daimler Auto Import Co., of New York, which was petitioned into bankruptcy last week. The company's liabilities are estimated at $30,000, of which only about $500 is due merchandise creditors.

R.C.H. ENLARGES BOARD AND ACQUIRES SUPPORT

Having too Much Business for its Capital, Detroit Company Confers with Creditors—They Afford Quick Relief.

With orders in hand for some 16,000 cars and with its business growing too rapidly for the amount of capital invested, the R. C. H. Corporation, of Detroit, frankly called its creditors and stockholders into conference in that city on Friday last, 25th inst., when the required support was secured.

The company's exact financial condition was made known by its principals in the form of a report compiled by McPherson, Weiss & Co., expert auditors and accountants, which showed an excess of assets over liabilities of $576,000. Two hundred merchandise and banking creditors, whose interests aggregated $61,600,000, were represented at the meeting, all of whom assented to a plan that will permit the business not only to be carried on but further expanded.

To better permit of the execution of the plan, the R. C. H. board of directors will be increased from three to nine. One of them will be R. C. Hupp; the others will represent the creditors. Sixty per cent. of the voting stock will be placed in the hands of a committee of three, with power to vote the stock at its discretion, which requirement is designed to protect the creditors and to insure the continuance of the business should anything happen to R. C. Hupp or his brother, L. G. Hupp, while the arrangement is in force.

The enlarged board of directors will be made up as follows: John Kelsey, Kelsey Wheel Co.; J. F. Hartz, C. M. Hall Co.; H. S. Firestone, Firestone Tire & Rubber Co.; Charles P. Sieder, Sieder Mfg. Co.; Joseph H. Clark, attorney; Fred M. Randall, Chas. H. Fuller Co.; G. A. McCutcheon, American Gear Co.; J. H. Sieberling, Goodyear Tire & Rubber Co., and R. C. Hupp.

According to the plan adopted at Friday's meeting, factory operations will be continued without interruption and the creditors will receive payment on account, pro rata, at stated periods, which represents an extension of practically 12 months. All current bills are to be paid in cash.

According to the by-laws of the R. C. H. Corporation, the plan can not become operative until Friday, November 8th, but such a large proportion of the creditors already having assented, there is no doubt of its consummation, and as there is on hand sufficient material to make up some 1,500 cars, factory operations will not be interrupted or delayed in any way.

Bankruptcy Petition Stops Ohio's Sale.

On Monday last, 28th inst., the date when the receiver intended to apply to the court for an order to sell the property of the Ohio Motor Car Co., of Cincinnati, three creditors filed a petition in bankruptcy against the company, charging, among other things, that the receivership was designed to permit the Diamond Rubber Co. to protect its claim of $6,000 and thus to give to it preference over other creditors. It is also alleged that on May 1st last, while insolvent, the Ohio company gave the Miami Valley National Bank of Commerce a bill of sale and mortgage on 11 automobiles to secure a debt to the bank of $11,552, and still later turned over two more cars to the same bank. The creditors who filed the petition in bankruptcy are the Eisemann Magneto Co., with a claim of $1,980, the Bosch Magneto Co., $495, and W. D. Byron & Sons, $825.

The receiver has in hand a bid of $65,000 for the entire assets of the Ohio company, which will be paid one-third in cash and the remainder in notes running up to 18 months. As the real estate is encumbered by a $25,000 mortgage, the offer, if accepted, would net $40,000 cash.

"Nobby Tread" Goes To Supreme Court.

What amounts to a request that the United States Supreme Court review the Republic Rubber Co.-Morgan & Wright fight over the validity of the Tod J. Mell patent, No. 898,907, covering the Republic "Staggard" tread, was made this week when the Republic company submitted a petition for a writ of certiorari. Inasmuch as such petitions rarely are granted in patent cases the success of the appeal is doubtful.

The decision of which reversal is sought was made by the Court of Appeals in May and was to the effect that the "Nobby" tread of Morgan & Wright did not infringe the "Staggard" patent, after the lower court the "Staggard" patent, which decision was rendered after the lower court had ruled that the patent was valid.

LaCroix-Daimler Suit is Adjusted.

The suit of the Paul LaCroix Automobile Co., of New York, against the Daimler Auto Import Co. for $50,000 for breach of contract has been amicably settled. The action grew out of a contract executed in January last whereby the LaCroix company was given the Mercedes agency for the Metropolitan district. Only a very limited number of the cars called for were delivered, however, and as a result the LaCroix people resorted to law.

U. S. MOTORS' RECEIVERS RENDER FIRST STATEMENT

After Viewing Figures, Court Orders Certain Payments and Authorizes Receivers' Certificates—Minority Stock Objects.

It probably will be December 15th before the United States Motor Co. is relieved of its receivership. This was indicated on Monday last, when the receivers, W. E. S. Strong and Roberts Walker, rendered their first report to Judge Hough in the United States District Court in New York City, although it is possible that the several properties may be disposed of before that date and progress correspondingly be advanced. At any rate, Judge Hough directed that a sale be arranged as soon as possible, and designated November 11th as the time for appearance to discuss any plans of sale which may be submitted to the court, which denied the receiver's request for permission to liquidate the several selling companies located in various parts of the country which they have found were operating at a loss. Instead, Judge Hough ordered that special application be made in each case.

The receivers were authorized to continue the business and to issue, as needed, receivers' certificates to the amount of $1,500,000. These are to become a first lien against all of the property except the Maxwell-Briscoe plant, and only against that factory, if necessary as a last resort. The hearing in court brought out, what was already quite generally known to the trade, that the Maxwell-Briscoe Motor Co. is the most profitable unit of the United States Motor Co., and it is, therefore, particularly desirable that its business be conducted without interruption. It also developed that the Westchester Appliance Co., which has to do with parts and accessories, likewise has been run at a profit.

Among other things, Judge Hough ordered that deposits owed to dealers, amounting to $32,513, be paid from the trust fund created for that purpose, and that merchandise creditors who delivered goods to the United States Motor Co. between the time of the creditors' extension agreement in June and the appointment of receivers on September 12th be paid, where their claims are proven, the amounts to be apportioned against the various plants which received the goods. This means that the creditors immediately will receive the 25 per cent. in cash, as planned by the creditors' committee.

At Monday's hearing, attorneys representing Frederick Drew Bond, who, in turn, represents minority stockholders ho'ding

Digitized by Google

about 2,000 shares, filed a petition demurring against the action of the court, whose rulings were attacked on the ground of lack of jurisdiction. The United States Motor Co. being a New Jersey corporation, the petitioners maintained that the proceedings should be brought in the Federal jurisdiction in that state.

These minority creditors object to the assessment of $24 per share, as outlined by the reorganization committee, and if Judge Hough should overrule their demurrer, it is their purpose to carry the case to the United States Supreme Court, if necessary, which may or may not be done, and which may or may not serve to delay the reorganization of the big company. It is stated that the objecting stockholders will demand also an explanation of the decrease in assets reported since the receivership was instituted.

According to the consolidated statement of assets and liabilities as of September 11th, which was presented to the court on Monday, the United States Motor Co., as a going concern, has total assets of the estimated value of $12,728,165.60 and total liabilities of $11,817,856.27, an excess of assets over liabilities of $910,309.33. The liabilities, however, do not include the outstanding capital stock, amounting to $23,837,483.35, or a disputed claim of the Providence Engineering Works amounting to $38,532.26, or the Briscoe Mfg. Co.'s inter-company account, amounting to $313,970.91. The statement in full is shown by the accompanying ment in full is as follows:

AGGREGATE LIABILITIES.

Real Estate Mortgages	$ 164,540.90
Debenture Bonds, Bond Scrip and Interest	6,161,509.87
Notes of One or More of the Subsidiary Companies:— Endorsed by the United States Motor Company, and Notes of one or more of the Branch Selling Companies endorsed by the United States Motor Company, with interest	*2,194,258.12
Notes of United States Motor Company:— Endorsed by one or more of the Subsidiary Companies	650,820.99
Claims Against United States Motor Company Only:— Of this sum, approximately $100,000 is due for goods delivered immediately prior to Receivership	1,961,875.99
Claim Against Columbia Motor Car Company, or United States Motor Company, or Both	91,789.60
Notes Secured by Sight Draft on Car Shipments	63,691.26
Wages of Employes and Accrued Expenses	74,256.30
Dealers' Deposits (Partly Offset by Accounts Receivable)	55,113.24
Contingent Liability on Endorsement of Notes of E. R. Thomas Motor Car Company	†400,000.00
Providence Engineering Works:— Claim made for work performed—Disputed $138,532.26	—0—
Total Liabilities Other than Inter-Company	$11,817,856.27
Inter-Company Accounts:— Briscoe Manufacturing Co. $313,970.91 Briscoe Mfg. Co. $313,970.91 The Capital Stock of this Company is owned entirely by the United States Motor Company, and, as the Briscoe Mfg. Co. is regarded as a solvent Company, this liability is taken at	shrdl cmfw —0—
Excess Assets—Estimated Value as shown—Over Liabilities as Shown	901,309.33
Total	$12,728,165.60

Capital Stock (not included in this Statement) Outstanding—Outside Ownership:—

United States Motor Company, Pref.	$11,499,733.33
United States Motor Company, Com.	12,206,350.00
Columbia Motor Car Company, Pref.	13,400.00
Columbia Motor Car Company, Com.	118,000.00
	$23,837,483.33

* It is estimated that the Branch Selling Houses can pay $756,226.18 on their Notes, after providing for their local indebtedness.

† The Receivers of the E. R. Thomas Motor Car Company estimate that that Company will pay from 25% to 40% to its Creditors.

AGGREGATE ASSETS OF COMPANIES IN RECEIVERSHIP.

The Week's Incorporations

Naugatuck, Conn.—Richardson Auto Co., under Connecticut laws, with $4,000 capital; to deal in motor cars.

St. Louis, Mo.—Cadillac Automobile Co., under Missouri laws, with $50,000 capital; to deal in motor cars.

Wilmington, Del.—Dayton Motor Truck Co., under Delaware laws, with $100,000 capital; to manufacture motor trucks.

Louisville, Ky.—Highland Motor Transfer Co., under Kentucky laws, with $5,000 capital; to operate a motor delivery.

Johnstown, Pa.—United States Motor Sales Co., under Pennsylvania laws, with $40,000 capital; to deal in motor cars.

Jacksonville, Fla.—Jacksonville Tire & Supply Co., under Florida laws, with $250,000 capital; to deal in motor car supplies.

Trenton, N. J.—Hendricks Mfg. Co., under New Jersey laws, with $50,000 capital; to deal in motor cars. Corporators—F. S. German and others.

Augusta, Me.—Star Motor Car Co., under Maine laws, with $500,000 capital; to deal in motor cars. Corporators—N. L. Goodall, W. N. Sanborn.

New Orleans, La.—Exeride Filler Co., under Kentucky laws, with $15,000 capital; to deal in motor cars. Corporators—John Rommel and others.

Wilmington, Del.—Muston Multiple Co, under Delaware laws, with $125,000 capital; to deal in motor car supplies. Corporators—C. Spring and others.

Chicago, Ill.—Barry Taxicab Co., under Illinois laws, with $15,000 capital; to operate taxicabs. Corporators—A. A. Rolf, F. A. Tufford, Mathew Mears.

Louisville, Ky.—General Motors Co., under Kentucky laws, with $100,000 capital; to deal in motor vehicles. Corporators—R. A. Whitehead and others.

Chicago, Ill.—Terminal Garage, under Illinois laws, with $10,000 capital; to operate a garage. Corporators—Andrew W. Little, A. Cohen, Joseph L. McCarthy.

Dayton, Ohio—Independent Motor Inspection Co., under Ohio laws, with $10,000 capital; to appraise motor cars. Corporators—V. A. Troxell and others.

Boston, Mass.—Newbury Auto Co., under Massachusetts laws, with $5,000 capital; to deal in motor cars. Corporators—Ernest L. Rowe, George W. Mullett, Paul J. Scanlon.

Trenton, N. J.—Tibbett & Co., under New Jersey laws, with $10,000 capital; to deal in motor cars. Corporators—George Tunnicliffe, E. Knapp, Joseph Tibbetts.

Everett, Wash.—Ferrel Auto Co., under Washington laws, with $15,000 capital; to deal in motor cars. Corporators—A. M. Ferrell, Elbert Ferrell and others.

Salem, Ore.—Beaver State Motor Co., under Oregon laws, with $300,000 capital; to manufacture and deal in motor cars. Corporators—P. A. Combes and others.

Des Moines, Ia.—Van Vliet-Bradt Motor Co., under Iowa laws, with $10,000 capital; to deal in motor cars. Corporators—W. E. Moyer, W. J. Bradt, C. G. Van Vliet.

Chicago, Ill.—Olesen-Juergens Co., under Illinois laws, with $3,000 capital; to deal in motor cars. Corporaotrs—Lauritz Olesen, William A. Juergens, Julius Rubinstein.

Louisville, Ky.—Southern Motors Co., under Kentucky laws, with $100,000 capital; to deal in motor cars. Corporators—Alvin T. Hart, Richard V. Cook, G. G. Botts.

Waterloo, Ia.—Central Auto & Supply Co., under Iowa laws, with $10,000 capital; to deal in motor cars and supplies. Corporators—A. L. Alexander and others.

Bridgeport, Conn.—Locomobile Co. of Missouri, under Connecticut laws, with $10,000 capital; to deal in motor cars. Corporators—Arthur M. Marsh and others.

Buffalo, N. Y.—Lafayett Motor Sales Co., under New York laws, with $10,000 capital; to deal in motor cars. Corporators—Joseph A. Groh, Frank J. Batt, Annie E. Groh.

St. Matthew, S. C.—Calhoun Garage, under South Carolina laws, with $3,000 capital; to operate a garage. Corporators—C. R. Fuller, N. E. Salley, J. W. Salley.

Boston, Mass.—Eldridge Mfg. Co., under Massachusetts laws, with $25,000 capital; to manufacture motor car parts. Corporators William E. Eldridge, Harold B. Church.

St. Louis, Mo.—St. Louis Lozier Co., under Missouri laws, with $25,000 capital; to deal in motor cars. Corporators—H. B. Graham, Nelson B. Getahall, and others.

Seattle, Wash.—McKenna & Harmon, under Washington laws, with $2,000 capital; to deal in motor cars. Corporators—C. E. McKenna, F. E. Harmon, George B. Kile.

Chicago, Ill.—S. Breakstone, Inc., under Illinois laws, with $50,000 capital; to deal in motor cars. Corporators—Rudolph Storch, William H. Devenish, Jay Warner.

Tacoma, Wash.—Auto Equipment Co., under Washington laws, with $3,000 capital; to deal in motor car supplies. Corporators—R. F. Linquist, Hugo Metzler and others.

Chicago, Ill.—Dean Auto Devices Co., under Illinois laws, with $40,000 capital; to manufacture motor car devices. CorporatorsE. R. King, Robert L. Ames, George F. Ort.

Chicopee, Mass.—Fisk Rubber Co., under Massachusetts laws, with $10,000,000 capital; to manufacture rubber goods. Corporators—Harry T. Dunn, Harry G. Fisk, John C. Cole.

Pierre, S. D.—Twin City Motor Car Co., under South Dakota laws, with $60,000 capital; to deal in motor cars. Corporators—Paul J. Kalman, John Rapliam, W. F. Eddy.

Elmhurst, Ill.—Elmhurst Motor Sales Co., under Illinois laws, with $10,000 capital; to deal in motor cars. Corporators—Walter B. Kidder, Hosmer H. Allyn, Frederick H. Bates.

Waynesville, N. C.—Blue Ridge Motor Co., under North Carolina laws, with $25,000 capital; to deal in motor cars. Corporators—G. H. Paddock, James Atkins, Jr., H. Rotha.

Morgantown, W. Va.—City Automobile Co., under West Virginia laws, with $4,800 capital; to deal in motor cars. Corporators—J. L. Smith, B. S. Dering, N. B. Yost and others.

Chicago, Ill.—Motor Supplies Co., under Illinois laws, with $5,000 capital; to deal in motor car supplies. Corporators—H. C. Maibohm, P. W. Gillette, E. M. Beauchamp.

St. Louis, Mo.—Brashear Truck Co., under Missouri laws, with $5,000 capital; to deal in motor vehicles. Corporators—J. Roy Brashear, Boyle O. Rodes, Louis C. Haslam.

Dover, Del.—J. M. Shock Absorber Co., under Delaware laws, with $300,000 capital; to manufacture motor car accessories. Corporators—H. V. Carr, L. C. Michaelson, M. G. Ryan.

Washington, D. C.—Pnucar Co., under

Delaware laws, with $500,000 capital; to deal in motor cars. Corporators—Louis A. Hill, Louis E. Bradford, Benjamin R. Shockley.

Connersville, Ind.—Lexington Sales Co., under Indiana laws, with $100,000 capital; to deal in motor car parts. Corporators—Milton W. Tichenor, Edwin B. Lilly, Wm. M. Place.

Farmville, N. C.—Davis Motor Co., under North Carolina laws, with $50,000 capital; to deal in motor cars. Corporators—Jesse Speight, J. R. Davis, F. R. Townsend, W. L. Joyner.

Chicago, Ill.—Joliet Auto Supply Co., under Illinois laws, with $5,000 capital; to deal in motor car supplies. Corporators—Ben S. Moore, Thomas J. Bracker, John H. Garnsey.

Newark, N. J.—Charles E. Ball, Inc., under New Jersey laws, with $10,000 capital; to deal in motor cars Corporators—Charles E. Ball, J. Robert Whitlock, Schuyler M. Cady.

Westfield, N. J.—W. C. D. Motor Car Co., under New Jersey laws, with $50,000 capital; to manufacture motor cars. Corporators—Peter C. Wall, Walter E. Camping, W. J. Druppleman.

Chicago, Ill.—M. R. L. Resilient Tire Co., under Illinois laws, with $25,000 capital; to manufacture tire filler. Corporators—Mitchell R. Labbee, Martin O. Lundholm, R. Wilson More.

Newark, N. J.—Continental Garage Co., under New Jeresy laws, with $10,000 capital; to operate a garage. Corporators—Littleton Kirkpatrick, Robert C. German, Stuart A. Young.

Camden, N. J.—Hendricks Mfg. Co., under New Jersey laws, with $250,000 capital; to manufacture motor car devices. Corporators—F. R. Hansell, John A. MacPeak, F. S. German.

Boston, Mass.—United States Puncture Proof Tire Filler Co., under Massachusetts laws, with $50.000 capital; to manufacture tire filler. Corporators—Robert E. Magee, Austin Wilson.

Madison, N. J.—Michigan Motor Sales Co., under New Jersey laws, with $10,000 capital; to deal in motor cars. Corporators—Elmer L. Reynolds, Alvah L. Reynolds, Clara Reynolds.

Akron, Ohio.—Akron Welding Co., under Ohio laws, with $10,000 capital; to manufacture welded metal parts. Corporators—Milton M. Smith, George I. Stuver, Edward H. Doylan, David H. Morgan, Lucille S. Smith.

New York, N. Y.—Perfection Automobile Body Co., under New York laws, with $15,000 capital; to manufacture motor car bodies. Corporators—William H. Mendel, 145 Summit avenue, Mount Vernon; William H. Mendel, Jr., 2650 Broadway; James V. Simpson, 239 Summit avenue, Mount Vernon.

Changes Among Prominent Tradesmen.

A. E. Schwartz, treasurer and general manager of the Bergdoll Motor Car Co. of New York, has resigned those offices and will relinquish the duties on November 7th. His future plans have not yet become known.

C. W. Jacoby, former Eastern sales manager of the Standard Electric Co., has been appointed director of sales for the Pullman Motor Car Co., of York, Pa. He succeeds H. R. Averill, who resigned at the end of six years' service.

H. E. Bradford has been appointed shop superintendent of the Stewart Motor Corporation, of Buffalo, N. Y., manufacturer of the light delivery truck of that name. Previously he was identified with the Marmon and National companies in Indianapolis.

O. F. Conklin, for 16 years chief engineer of the Robbins & Myers Co., of Springfield, O., has been appointed consulting engineer to the Remy Electric Co., of Anderson, Ind. He will have special charge of the development and production of the Remy electric engine starter which shortly is to be placed on the market.

A. J. Rogers, manager of the Remy Electric Co.'s branch in San Francisco, has been transferred to the management of the New York house to succeed F. M. Henkel, resigned. P. E. Kempton, who has represented other magneto manufacturers on the Coast, has been appointed to fill the vacancy in the Remy establishment in San Francisco.

T. F. Johnston, who in August last resigned the management of the Buick Motor Co.'s Washington branch to become district manager in Philadelphia of W. C. Durant's Republic Motor Co., has been promoted to the post of general sales manager of the entire Republic establishment. He will make his headquarters in Detroit and will have entire charge of the sales of the Chevrolet, Little and all other Republic subsidiaries.

W. C. Sills, whose previous connection with the retail automobile business in Boston has served to make his name familiar to the trade, has been appointed general manager of the Republic Motors Co. of Massachusetts, which is one of the ten companies subsidiary to W. C. Durant's $65,000,000 parent Republic Motors Co. of Delaware. Headquarters of the Republic Motors Co. of Massachusetts have been established in Boston, where, for the time being, it will serve as a New England branch for the distribution of Little and Chevrolet cars.

Business Troubles.

Fred W. Herbst, receiver for the Barnt & Johnson Automobile Supply Co., of 2030 South High street, Columbus, O., is to sell the business as a going concern.

Edwin D. Bechtel has been appointed receiver for Claud A. Perkinson, automobile tire repairer and rubber worker on North Broadway, New York City; the receiver has authority to continue the business for 15 days.

A petition in bankruptcy has been filed against the Windermere Garage Co., 13560 Euclid avenue, East, Cleveland, O. The petitioning creditors are the Standard Oil Co., the Empire Tire Co. of New Jersey, and F. W. Schmidt, trading as the Euclid Printing Co.

Jesse J. Beitler, 561 West 141st street, New York City, formerly a dealer in automobile supplies, has been placed in the hands of a receiver; the Federal court named Leo J. Kersburg for the position, with a $500 bond. Beitler's liabilities are $3,536, his assets $2,236.

To foreclose a lien of $18,304 held by the Dayton Auto Truck Co., of Dayton, O., against the Motor Renting Co., of New York City, a writ of seizure for nine trucks was issued to the sheriff of New York county last week; the officer found the trucks at 103-7 West 108th street, where he left them in storage after levying upon them.

Changes in Capitalization.

Detroit, Mich.—Chalmers Motor Co. from $3.000,000 to $5,000,000.

Detroit, Mich.—M. & P. Electric Vehicle Co. from $50.000 to $100,000.

Muskegon, Mich.—Continental Motor Co. from $500,000 to $2,400,000.

Louisville, Ky.—Louisville Auto & Wagon Co. from $6,000 to $10,000.

Canton, Ohio—Knight Tire & Rubber Co. from $331,500 to $1,500,000.

Galion, Ohio—Cleveland-Galion Motor Truck Co. from $500,000 to $300,000.

Detroit, Mich.—Warren Motor Car Co. from $500,000 to $600,000.

Detroit, Mich.—Michigan Steel Casting Co. from $60.000 to $90,000.

Recent Losses by Fire.

Cedarhurst, L. I.—Michael Keller, garage and two motor vans destroyed. Loss, $9,000.

Detroit, Mich.—Hayes Manufacturing Co., enameling room damaged. Loss, $1,000.

FLASH BEATS 35% YET IS LOSER IN CONTRACT SUIT

Court Awards Verdict in Favor of Decarbonizer Manufacturer—But Upholding of Contract Spoils the Victory.

A victory that has much the appearance of a defeat was won this week in the Supreme Court for New York county when the Flash Manufacturing Co., of Zanesville, O., was given a verdict of $533.77 against the 35% Automobile Supply Co., the action being the outgrowth of one of the "35%" contracts which provide a manufacturer with an easy way of parting with his merchandise in exchange for advertising in a trade circular which the "35 per centers" claimed had a "60,000 circulation." The verdict was directed by the judge, the jury not being given the case for consideration.

The Flash company contracted to supply decarbonizer to the 35% company to the amount of $3,360, in exchange for which it was to receive advertising in the "35%" circular. After a part of the goods had been supplied, the Flash company made another shipment and claimed this was extraneous to the contract and demanded cash payment therefor. In the first trial the judge directed a verdict for the full amount asked, $1,094.40, and interest, whereupon the 35% company asked permission to insert a supplementary answer and counterclaim. The judge denied this request, but the order was reversed by the Appellate Division.

This necessitated a new trial. On the first trial certain letters purporting to show that the last shipment was not included in the contract were admitted, but on the last trial they were excluded. Instead of allowing a verdict for the amount of this shipment, the judge allowed the counterclaim, which was for goods not delivered as yet under the contract, and the decision virtually was a financial reckoning somewhat favorable to the defendants.

Company Drops Calmon Name and Line.

Having secured a factory of its own a year ago and discontinued the importation of the products of the Calmon Asbestos & Rubber Works of Hamburg, Germany, the Calmon Asbestos & Rubber Works of America, formerly at 103 John street, New York City, but now in the United States Rubber Building, Broadway and West 57th street, has changed its name, dropping the word Calmon from the style; this is to remove any impression that the company still is an importer of the Calmon products. At the same time, the capitalization was increased from $25,000 to $100,000, of which the president and general manager, Edward H. Garcin, remains as before the largest stockholder. There are no other company changes.

The company a year ago bought the factory of the New Jersey Asbestos Co. in Camden, N. J., and there, among its other asbestos products, manufactures asbestos gaskets and "Ajax" and "Motobestos" brake linings. Before manufacturing its own goods the company had the exclusive Calmon agency for America.

Winton Settles London Rental Suit.

Satisfactory settlement having been made by the Winton Motor Carriage Co., of Cleveland, O., the action for rental of showrooms in London, Eng., brought September 15, 1911, in the United States District Court for the Southern District of New York by Herman Adolf Schatz was this week discontinued. Schatz was assignee of the Argus Properties, Ltd., which was landlord of 149-51 Brompton road, Kensington, London, and which rented these premises on November 30, 1906, to the Winton company for a period of 21 years, at an annual rental of £2,000 for all except the first seven years, the rent for that period to be £1,950.

The Winton people wished to transfer the lease in March, 1910, to the Picture Theaters, Ltd., but the Argus Properties opposed this. The Winton company then moved out and suit for a total of close to $12,000 was brought. A similar action was instituted in the High Court of Justice, King's Bench Division, in England. The settlement arrived at terminates both actions.

Haynes, of Missouri, to Dissolve.

Declaring that it has ceased to do business, the Haynes Automobile Co. of Missouri capitalized at $11,000, the headquarters of which are in St. Louis, has filed a petition for dissolution. The petitioning stockholders certify that all of the company's assets have been sold and its liabilities paid. These stockholders are as follows: T. H. Shiff, St. Louis, $7,200; J. J. Braznell, St. Louis, $1,000; H. W. Payne, St. Louis, $100; F. W. Niedermeyer, Columbia, Mo., $2,700.

Canadian Electric Gets Knox Trucks.

The Canadian General Electric Co., whose main office is in Toronto, is "going into" gasolene vehicles. To that end, it has secure the Canadian agency for the entire line of Knox trucks and fire apparatus. As the company maintains branches in all of the principal Canadian centers, it is well prepared to distribute the Knox productions throughout the Dominion.

TO PRODUCE NEW ELECTRIC TRANSMISSION MECHANISM

Company Now Forming With W. C. Baker, Who Controls Patents, At Its Head—Combines Magnetic Clutch and Dynamo.

For the purpose of manufacturing and marketing a new type of electric transmission which bears slight resemblance to several similar mechanisms which during the past year or so have made considerable reputation for themselves in foreign automobile circles, a company is in process of formation in Cleveland, O., and that the device is no experiment nor mere hazy vaporings is borne out by the fact that no less a person than Walter C. Baker, president of the American Ball Bearing Co., of Cleveland, and formerly intimately connected with the Baker Electric Co., is at the head of the venture. Baker himself controls the patents under which the mechanism will be produced, though they originally were issued to Justus B. Entz of 11439 Mayfield road, Cleveland.

The device has been in an experimental state for the past three years, and only within the past week has been brought to the state of final development where its incorporation and actual operation in an automobile were possible. Although negotiations pending the erection of a factory already are in progress, it has not yet been definitely decided whether complete automobiles incorporating the mechanism will be produced or whether the electric transmission alone will be produced as a unit and disposed of to automobile manufacturers.

According to available information concerning the device, it is applicable to any gasolene propelled car and eliminates the necessity for the usual mechanical clutch and the change gear mechanism, incidentally permitting materially increased transmission efficiency and the degree of flexibility in control inherent in the electric car. In its simplest aspect, the mechanism consists of a combination generator and magnetic clutch and a small electric motor mounted on the propeller shaft. The armature of the generator is direct connected to the propeller shaft and serves as the female member of the clutch. The field of the generator is connected directly to the crankshaft of the engine and acts as the male member of the clutch. In operation, slippage of the clutch, which permits the field and armature to rotate at different speeds results in the generation of current which is passed to the electric motor and thus assists in driving the car at other

Digitized by Google

than high speeds. At high speeds, the armature and field of the generator rotate together as a magnetic clutch, and as no current then is generated, the electric motor temporarily is out of service. Control of the apparatus is effected through the use of a single foot lever which takes the place of the usual clutch pedal, the throttle and the spark advance lever.

Kelly Truck Offers Stock to Public.

The Kelly-Springfield Motor Truck Co., which recently took over the Kelly Motor Truck Co., is offering to the public, at 105, its 8 per cent. cumulative preferred shares, par value $100. Subscribers to this preferred stock also are given the option of purchasing, at $50 per share, common stock, par value $100, in amounts not exceeding 25 per cent. of the preferred subscriptions.

The capital of the new company, $2,500,000, is made up of 10,000 shares of common and 15,000 preferred, of which there is "to be issued presently 5,100 shares of common and 8,000 preferred of the total value of $1,310,000; of this number 2,193¾ shares each of common and preferred, to the value of $439,750, will be used in the acquisition of the Kelly property. Of the remainder, 2,901 shares of common at 33 1/3 per cent. of par, and 5,801¼ of preferred at par, total value $676,833.33, all of which was purchased by the New York banking house Emerson McMillan Co., will go into the treasury of the new company. Of the money put into the treasury, about $400,000 will be used to discharge obligations of the Kelly Motor Truck Co., which were assumed by the new corporation, the remaining $276,000, together with the liquid assets acquired, will provide an available working capital of something more than $500,000.

In the organization of the new company, and in acquiring the Kelly property, no stock was or will be issued for promotion purposes. It is stated that the old company at this time is making net earnings at the rate of more than double the amount of the dividend of the new preferred stock that is to be issued.

International Motor Sues a Tenant.

Because A. F. Fox & Co., who until a short time ago ran a shop in a loft building in West 55th street, New York City, failed to pay their rent to the International Motor Co., the latter brought an action late last week in the Supreme Court for New York County. The Motor company asks a sum close to $1,000. The Fox company now is said to be located in the Benz building in Brooklyn. In addition to the Fox company, Arthur F. Fox is named as a defendant.

ORSON COMBINATION IS FINALLY CONSUMMATED

After Long Delay, Merger of Car Company and Springfield Metal Body Goes Through—Plans in View.

After hanging fire for some six months, the amalgamation of the Springfield Metal Body Co. and the Brightwood Mfg. Co., both of Springfield, Mass., has been consummated, although several minor details still remain to be settled.

The merger first was undertaken in May last, when Jason Waters, who is connected with the New York banking firm of Strong, Sturgis & Co., figured as the moving spirit. Since that time, however, the negotiations passed to Tucker, Anthony & Co., Boston bankers, who also have a New York office and who will underwrite the present undertaking.

Originally it was intended that the new company should be styled the Nayasett Motor Co., but in the process of evolution that name has been discarded and a title woven around the name Orson probably will be employed, and the capital stock of the company will be about $1,500,000 instead of $2,000,000, as at first outlined.

The Springfield Metal Body Co., of course, is well and favorably known to the trade, but the Brightwood Mfg. Co. has figured but inconspicuously, having been devoted almost wholly to the production of a limited number of Orson cars, which were built on a subscription plan originated by a number of New York bankers, several of whom will be identified with the new enterprise.

The Smith brothers will remain as managers of the body plant, and the Brightwood company will continue to produce cars, but on a much more extensive plan. The car probably will be styled the Orson, but will be of a different type. It is the intention of the new company to produce trucks also, to which end negotiations are in progress for the American rights of a foreign vehicle, which, however, is not the Italian S. P. A. truck, which was included in the original outline.

Michelin Withdraws from the Sport.

After having given its support to automobile racing for seventeen years, and maintained its interest long after practically all other tire manufacturers had abandoned the sport, the Michelin Tire Co. formally has withdrawn from further participation in such competition. Public announcement of the fact was made early this week by J. Hauvette-Michelin, head of the Michelin works in Milltown, N. J.

Explaining the Michelin action, and while acknowledging that the knowledge gained in racing has served to improve tires, he states that the decline of interest and the glory earned by Michelin makes the moment fitting for the Michelin withdrawal. Michelin also adds that the number of serious accidents which have occurred during the season has influenced the action.

Oakland Lengthens Chain of Branches.

Lengthening the chain of branches it is establishing throughout the country, the Oakland Motor Car Co. has opened a branch in Houston, Tex., at Caroline and San Jacinto streets. It will be in charge of A. J. Challinor, who previously was connected with the Oakland factory in Pontiac, Mich. The Houston branch will be operated in connection with the larger establishment in San Antonio. The Oakland company also has leased, for ten years, a two-story building which is to be erected and completed about February 1st at 1521-23 McGee street, which building its branch will occupy.

Little Judgment Against "Big" Name.

Even though the Automobile and Cycle Co. of America, of 1777 Broadway, New York City, has a rather high sounding name, the name was not sufficiently imposing to prevent judgment being taken against the concern by W. R. Smith & Co., of 306 West 52d street, for repair work. The judgment, $37.67, was filed last week in the New York county clerk's office, and this week was satisfied. The defendant deals in used cars and employed the Smith company to do repair work.

Favary Seeks Site for Tire Factory.

Ethelbert Favary, of the Favary Tire & Cushion Co., of New York, which recently evolved an airless substitute for the pneumatic tire, is seeking a factory site. Last week he addressed the Business Men's Association of Middletown, N. Y., and offered to locate his factory in that thriving town if the citizens will subscribe $25,000.

Ajax Again Adding to its Plant.

The Ajax-Grieb Rubber Co. is enlarging its plant in Trenton, N. J., by the addition of a three-story brick building, 200 x 60 feet. It will be completed not later than December 31st of this year.

Federal Tire Opens Branch in St. Louis.

The Federal Rubber Mfg. Co., of Milwaukee, has established a branch in St. Louis at 4638 Olive street. It is in charge of F. S. Cropley, who at one time was identified with the G & J Tire Co.

SYSTEM IN SMALL REPAIR SHOPS.

An idea that is none the less erroneous because it is rather widely accepted is that system is synonymous with red tape. Nothing could be further from the truth, for while red tape, according to the common acceptance of the term, is a hedge of unnecessary procedure that stands in the way of accomplishment, system is just the opposite, its purpose being the improvement of results by the improvement of methods.

Whether it is through misunderstanding of the real meaning of the term "system," or through skepticism as to the utility of systematic methods when applied on a small scale, it is certain that the average small repair shop is run about as loosely as an establishment can be run. It is not exaggerating to say that the typical repair man has no idea whatever of his financial standing beyond a knowledge of the amount of cash in his pocket. He does not know what profit he makes on labor and material. If a job happens to cost a great deal more than it ought to, he may know, vaguely, that such is the case; but he will not know exactly why, because he lacks an analysis of the work. He cannot stop leaks, because he does not know where they exist, unless they are so big as to swamp him.

The fact of the matter is that system, in its real meaning, is just as necessary in a small shop as in the extensive plants where such industrial wonders have been wrought by the application of proper methods. There is no reason why everything in a small shop should not be done according to the best ascertainable methods. By means of systematic methods, and in no other way, can loss be turned into profit in many little shops, and the sooner this is realized and put into practice by shop owners the better it will be for their bank accounts.

CARBURETTERS AND FUEL CONSUMPTION.

It is to be hoped that those who are inclined to look askance at carburetter performances will at least take the trouble to do a little figuring for their own good before pooh-poohing the idea that real savings in dollars and cents are made and can be made by others, in many instances by the mere turning of a couple of screws.

For instance, if a car is driven 5,000 miles in a year, which is conservative, at an average of 12 miles to the gallon of fuel at 22 cents a gallon, the total cost for fuel will be $91.74. If, by more careful carburetter adjustment, or by the use of an auxiliary air valve, the average mileage can be increased to 15 miles to the gallon, the cost for fuel will drop to $73.33, representing a net saving of $18.20.

Of course, the saving in this case is not very large, but that very much larger savings really can be effected is made very plain by one carburetter manufacturer who has gone to the trouble to find out and to publish figures which are nothing short of remarkable. In one case, where the average miles per gallon of fuel was only 7, this was increased to no less than 16½, saving some 58 per cent. in the cost of fuel; in dollars and cents it amounted to $154.25. In another case, the mileage was doubled and the actual saving effected was $94. In each case the amount of fuel was the same and represented one year's consumption.

It is true that manufacturers fit to their cars carburetters that may be expected to realize very nearly maximum efficiency. But the fact remains that commercial gasolene is getting heavier, and the heavier it gets the more air will be required to effect complete combustion. Cars which a few years ago could and did average better than 15 miles to the gallon of fuel scarcely can be expected to maintain so high an average under present conditions.

The remedy is not wholly out of reach. If it is possible to so alter the adjustment of the carburetter as to permit a greater proportion of air in the mixture without seriously impairing the efficiency of the device over the whole range of engine speeds, the solution of the problem will be forthcoming in the majority of cases. But no carburetter is absolutely automatic in action over the complete range of engine speeds; there are critical speeds at which its efficiency will be high, just as there are critical speeds at which its efficiency will be low. In such cases, it often is possible to increase all-around efficiency by the addition of one of the various auxiliary air valves which within a comparatively short time almost have become epidemic. As a final resort, it may be necessary to fit a new carburetter in the place of the old one, and in the case of old cars this generally is a wise proceeding, for the reason that carburetter development has made great strides within the past few years, and the best performance of many of the old types scarcely is as good as the worst performance of modern devices.

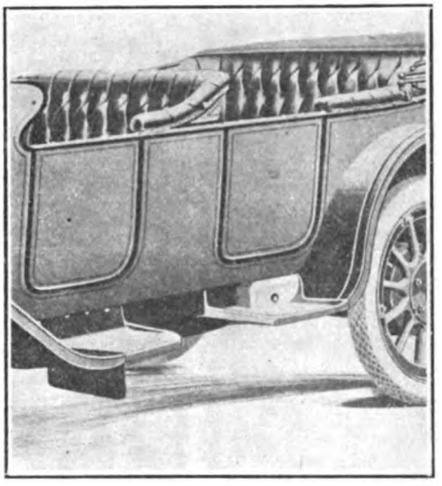
TOPICS TO BE DISCUSSED AT N. A. A. M. CONVENTION

Speakers Selected for Detroit Meeting and Subjects Assigned—Short Sessions to be the Rule During Three Days.

It will be no ordinary meeting that the National Association of Automobile Manufacturers will hold in Detroit on November 13, 14 and 15. Rather it will be more in the nature of a convention in which the usual routine will be so far departed from that several papers dealing with subjects of moment to the trade will be presented by men competent to handle the topics assigned to them.

The arrangements for the convention are in the hands of a committee made up of the following Detroiters: R. D. Chapin, S. D. Waldon, W. C. Leland, Hugh Chalmers and W. E. Metzger, and H. W. Ford as secretary.



The headquarters of the convention will be at the Hotel Pontchartrain. The proceedings will open with a meeting of the executive committee on the afternoon of the 13th. The first session of the general meeting will be held at 10 A. M. on the 14th. There will be another session in the afternoon, and in the evening the members will be the guests of the Detroit manufacturers at a banquet at the Pontchartrain. There will be two business sessions on the 15th, the next day being left open for visits to factories and other points of interest. Each of the business sessions will last about two hours.

The papers which will be read are as follows: "Yearly Models," by C. C. Hanch, Nordyke & Marmon Co.; "Some Selling Problems," Hugh Chalmers, Chalmers Motor Co.; "Multiplicity of Models," G. W. Bennett, Willys-Overland Co.; "The N. A. A. M., What it has Accomplished and What Can be Accomplished," S. A. Miles, general manager; "The Commercial Car," S. D. Waldon, Packard Motor Car Co.; "Relation of the Volume of Motor Carriage Business to the Volume of Commercial Car Business," David Beecroft, editor Motor Age; "Injudicious Methods of Selling Commercial Vehicles," M. L. Pulcher, Federal Motor Truck Co.; "Traffic," J. S. Marvin, traffic manager N. A. A. M.; "Why all Manufacturers Should Use the Standard Warranty," Walter C. White, The White Co.; "Territory and Discounts," E. R. Benson, Studebaker Corporation; "Good Roads," R. D. Chapin, Hudson Motor Car Co.; "Labor Conditions," H. M. Leland, Cadillac Motor Car Co.

It is estimated that the attendance at the convention will represent 80 per cent. of the country's automobile production, which implies that the gathering will be uncommonly representative of the industry.

Little Known Features of Well Known Cars

There's no chance to "clutter up" the running board of an Oakland car, for the very simple reason that there is no running board. In place of that time-honored adjunct, two large steps are provided, one in front of the entrance to the driver's seat and the other positioned where it is most convenient for the use of those who ride in

OAKLAND SEPARATE STEPS

the tonneau. By way of preventing mud and water from splashing over the rear step, a leather apron is hung under the front step, which intercepts the dirt which is thrown from the front wheel.

As for the accessories in the shape of spare tires, gas tank and tool box, which usually are positioned on the running board, other locations have been found by the designers of the Oakland which are more advantageous, in that they are not so prominent and consequently do not mar the appearance of the car to so great an extent as when they are positioned on the running board. The tires are carried on the rear, as has been usual with the Oakland for some time, and the gas tank also is placed in the rear next to the fuel tank. The tool box is positioned where it is readily accessable by the man who has to use its contents, under the driver's seat.

"National Association" in Asbury Park.

Without having learned what the wild waves are saying, A. L. Bowers and Stedman Applegate, of Asbury Park, N. J., have organized the National Automobile Owners' Association. Like practically all of its many similarly named predecessors. Asbury Park's "national association" proposes to sell accessories to car owners at cost prices and otherwise to point the way to the millennium.

November 8-16, London, England—Society of Motor Manufacturers and Traders' annual show in Olympia Hall.

December 7-22, Paris, France—Paris Salon.

January 6-11, Cleveland, Ohio—Cleveland Automobile Show Co.'s exhibit in the Central Armory.

January 11-18, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Pleasure cars only.

January 20-25, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the First and Third Regiment Armories.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

January 27-February 1, Detroit, Mich.—Detroit Automobile Dealers' Association's show in Wayne Gardens.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Pleasure cars only.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

February 10-15, Minneapolis, Minn.—Minneapolis Automobile Show Co.'s show in the National Guard Armory.

February 17-22, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in the Convention Hall.

March 3-8, Pittsburgh, Pa.—Pittsburgh Automobile Dealers' Association's show in Duquesne Garden.

March 17-22, Buffalo, N. Y.—Buffalo Automobile Dealers' Association's Show in the State Armory.

March 24-29, Indianapolis, Ind.—Indianapolis Automobile Trade Association's show.

SOLUTIONS OF THE USED CAR PROBLEM

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Four Best Articles Dealing With the Subject.

By MILTON SANDMAN, Brooklyn, N. Y.

In my experience of six years with used cars, I do not see why there should be alarm over the problem of their disposal. The demand for such cars always has been good, and this year has been brisker than that for new models.

The whole trouble lies with the new car dealers, any of whom will allow at least $100 more than a used car is worth to sell a new one over a competitor or to prevent their customer from buying a car of a different make. The used car is then turned over to a second-hand dealer or to the "used car department," where it is held at an exorbitant price and lies on their hands a long time.

There is ready sale for any used car that will run, if it is sold at its real value; but it is a recognized fact that a popular priced car depreciates 50 per cent. the first year and 25 per cent. for each succeeding year, and at this rate almost any car, except it is a mechanical failure, is easily saleable. But, on the other hand, the United States Motor Co. sold a Mr. S—— a Maxwell car for $1,150 and offered to allow the full amount a year from date on the purchase of a new Columbia. Another company selling a car for around $1,400 offered to allow a friend of mine $750 on a Hupmobile runabout which was two years old and which cost originally only a few dollars over that figure.

As soon as this method of doing business stops the used car problem will be solved. A high grade used car is easily sold; it is fairly well known that if it has been properly handled and taken care of it will outwear a new cheap one. The buyer of a used car is usually an engineer or a sound business man who knows that there has been no real advance in automobile construction in the last four years, with the exception of the self-starter, and any engineer will admit that there is better material and better workmanship in the "old boats" than in many of the new cars.

One solution of the used car problem is to have a central exchange, maintained by the new car dealers, who will appraise the cars which are to be taken into trade and a uniform rate will be allowed by any concern taking used cars in trade. Then a buyer will not have to shop around so much and fall into the clutches of a "second-hand shark" who doctors old cars up instead of overhauling them and represents '08's as '11's, which is putting the automobile business in a class with highway robbery.

The population of the United States is large enough to absorb all the used cars until they finally reach the junk heap, not to mention the number which are turned into delivery wagons for merchants.

By MARK H. HARIG, Cincinnati, O.

The rapid increase in the number of automobiles used as taxicabs and delivery wagons suggests a method which should be of considerable assistance to the dealer in getting rid of used cars. Most of the used cars that are given in part payment for new cars are disposed of not because they are worn out, but because their owners believe they must have the latest, up-to-date models. Such traded-in cars usually run fairly well and are capable of giving good service for a considerable time. Few of the prospective purchasers who come to the dealers want second-hand cars, however; they want new ones.

My idea of the solution of the problem of what to do with these cars that nobody seems to want is to turn them into taxicabs and delivery cars. For such purposes used cars will serve very well, because the matter of appearance is of no particular importance. The machines are used for business, and there is no demand for style or showiness.

I believe that the number of second hand cars thrown upon the hands of the dealers could be considerably reduced by the abandonment of the yearly model plan; it is a nuisance, and no material good ever can come of it. There is no reason why manufacturers cannot add improvements in design, construction or equipment at any time they may see fit, without waiting to get out the next year's models.

There are many people who purchase a new car every year merely because they feel that they must have the very latest model. If, however, there were no yearly models, there would be no such hurry to abandon a good car, and the lure of advertisements in large letters, reading, for instance, "1913 models just arrived; come in and see them," would not be working to keep our car owners jumping from one machine to another, to the embarrassment of the overloaded dealer.

Another possibility in the disposition of used cars would be to ship them out West, where the farmers and ranchmen are rapidly taking up the motor car. These people want good, serviceable machines; but they have not yet been attacked by the craze, as it might be called, for owning the very latest, up-to-the-minute models.

TASK SYSTEM OF ORGANIZATION AND ITS BENEFITS.

There is a heap of difference between the results achieved by a number of units working independently and the "systematic union of individuals working together for a common end." There is absolutely no choice as to which is the best method Organization methods are so far superior and bring so much greater results that every dealer who understands them will hasten to employ the organization or "family" idea.

Some dealers have a large number of employes, but absolutely no organization—that is, no systematic union working together. Such dealers should study the methods of the big factories—the supremely successful ones—and they will find the secret of efficiency in every case due to the working out of the organization idea.

Possible Even with Small Staff.

Supposing there are only four or five employes; can the idea be worked? Yes, it can be worked where there are only two. The basic idea of an organization is to have every man in the right place—each individual fitting into the scheme of things and doing his part. It means definite plans in which all have a share; it means a weekly conference in which all take part—in which each one has a chance to express his views and give the house the benefit of the past week's experiences. It means a discussion of the knotty points in salesmanship, a better understanding of the store policy and methods. A friendly but none the less sincere, earnest and enthusiastic interest in the welfare of the institution as a whole. It means the employment of the "task system"—that is, the getting together of the sales force and laying out what must be accomplished for the month and the placing of individual responsibility in the carrying out of the "task."

This "task" system works wonders. Where it is employed everybody knows what the plans are—everyone is working toward the accomplishment. Each day's reports show daily progress — each weekly conference shows what remains to be done —and with this sort of planning no one shirks because each one knows what the other has set himself to do and there is a spirit of competition that soon leaves the drones so far behind that they are automatically sifted out. On the other hand, by imparting correct ideas of vigorous, systematic work, it will open new chances to the energetic and resourceful.

MODERN METHOD OF CONDUCTING DEMONSTRATIONS.

Walter Bemb, of the Bemb-Robinson Co., of Detroit, and who sell Hudson cars, has clean-cut, positive, modern ideas in reference to store management.

Demonstrations run on schedule time are part of the Bemb-Robinson plan, but the salesmen do not drive the demonstrating cars; they are regarded as salesmen, not chauffeurs. They dress neatly and sit in the back seat with the prospective purchaser.

Uniformed Driver Demonstrates.

"While I am a fairly good driver," said Bemb in discussing the subject, "and have driven a car for years, I found that I could not keep my eyes open for the traffic officers and for the approaching and crossing vehicles and at the same time deliver a selling talk to the prospect. Therefore we inaugurated the plan of having a special "chauffeur" or driver properly uniformed. He does all the driving and has complete charge of the demonstrating cars. These are washed and polished every night. The chauffeur is responsible for keeping them tuned up, and, as he alone does the driving, and the cars are never driven at night, it is possible to keep them in the "pink of condition" that insures successful demonstration.

"True, this plan costs a trifle more, but it is much easier on the cars and results in an ideal demonstration. It also permits the salesman to call at the office or home of a prospect well dressed, clean, and looking like a gentleman, instead of wearing a pair of gauntlets and a set of goggles, like a cross between a maniac and a chauffeur.

Concentrates Mind On Customer.

"Another decided advantage of our plan is that it places the salesman on a proper footing with a customer. We found that many people unconsciously treated the salesman who drove as a sort of superior chauffeur. Our plan places him on an entirely different footing, and enables him to devote his mind and his time to the possible buyer, and when a salesman steps up to the office of a prospect and says, "My man is waiting outside with the car," it makes a pleasing impression that has a permanent selling value.

Each Demonstration Is Scheduled.

"All demonstrations are mapped out and listed on the board in the garage. The car is ready to go on duty at eight o'clock and, for example, one salesman may have a demonstration arranged for between eight and nine, and another one between nine and ten. In each case the demonstration is planned so that it ends on time to make the next one according to schedule. You can see at once that this cuts down the number of cars required for demonstrators and at the same time makes salesmen plan carefully for the best use of their time.

Porter Uniformed in Khaki Suit.

"Another little point that makes a hit is the uniforming of our porter. We provide him with two Khaki suits with the Hudson Triangle on the arm, and each Monday morning he puts on a clean suit. Instead of a dirty looking attendant, we have at slight outlay, a clean, smartly-dressed man who takes pride in his appearance."

PATRONS ATTRACTED BY MAKING STORES ATTRACTIVE.

An up-to-date salesman stepped into the store of a Baltimore automobile dealer and, after securing an order, he turned to the dealer and said: "Mr ———, you have known me for a long while, but this is the first time you have given me an order, and at the risk of losing it I am going to tell you something. I hope you will take it in the spirit in which it is offered. Your store does not look like the store of a merchant. It is dirty. It is unattractive in every way. It has no conveniences for ladies. It looks just as it did four years ago. You have made no improvements, and you are suffering because of it.

Few Dollars Well Spent.

"Now, I am going to make a suggestion. Spend from three to five hundred dollars fixing up the place. Get the walls and ceilings tinted neatly with some soft color; get some paneled effects in mission woodwork—a few mision chairs of good quality—a good looking table for these papers and some new lighting fixtures for the show rooms and a new desk for yourself. You will be surprised to see how much energy and enthusiasm you will obtain from having new, up-to-date appointments, and you'll get a class of trade that now passes your doors but does not enter."

At first the dealer did not relish the suggestion. But he knew that the salesman was right, and he did not cancel the order but actually thanked him for taking an interest in his business.

Salesman Receives Dealer's Thanks.

Some sixty days later the salesman got a letter from this dealer saying: "Next time you are in Baltimore be sure to come and see me. After thinking the matter over, I followed your suggestions to the letter and already can see the results. People who never came near me before are now dropping in. We are getting a class of buyers who used to pass us by. Thank you for the suggestions—and next time you are in Baltimore you are my guest."

Neat, Clean Stores Attract Buyers.

"He that would catch fish must venture his bait," says Poor Richard—and, like most of his sayings, there is a world of truth in it for the business man.

There are automobile dealers who are so close-fisted that they never get any bait on their hook at all; some have been known to be even too close or too careless to remove from their windows the worn lettering, advertising a line of cars long since passed out of existence. Is it any wonder things don't come their way?

One kind of bait that costs little is the neat, clean store.

Hardware dealers who ten or twelve years ago were the laughing stock of merchants in other lines to-day have uniformly the best window displays and the best window fronts of any class of merchants in the countrty. Instead of being mere sellers of nails, they have put in varied lines of goods that once were never seen in a hardware store, and they keep their windows clean. Even the smallest town one enters has its prosperous, attractive hardware store.

Study Windows of Hardware Trades.

Automobile dealers can study the hardware dealers' progress with profit. Clean windows, clean floors, dustless woodwork, attractively planned show rooms are tempting bait for the prospect, but they mean an outlay of money both for the original investment and for the upkeep. Does it pay? Did you ever hear of a merchant who lost money by increasing the attractiveness of his store?

Now is the time to make your plans and have the work done. Look over your store and see what improvements can be made. Then have them done as quickly as possible. The clean, well lighted, well appointed store attracts patrons as naturally as the dirty or dingy store repels them.

YOU PAY FOR SHOW WINDOWS; WHY NOT USE THEM?

When automobile dealers—and dealers in accessories, too—awaken to the fact that store rents are based upon the opportunities afforded by proper use of window display space, they will realize the full meaning of "wide awake merchandizing" and make the most of the very opportunities for which they pay a high price. At present it is so utterly neglected that the dealer who is putting brains, time, and study into window displays stands out "like a skyscraper in a village of wooden shanties."

"Automobile Row" in Toledo, Ohio, certainly is no better, and perhaps no worse, than the "rows" of other cities in this respect. Dealers pay large rents to get on Madison avenue. It is a main thoroughfare and probably more automobiles and more people able to buy automobiles go up and down that avenue than any other street in Toledo. Yet, for every store that is utilizing the opportunities that accrue from this steady traffic there are five who are permitting them to go to waste.

Money Lost Through Neglect.

One instance will suffice to carry the point: In the very heart of this Toledo automobile center is a store with two generous windows. What do the thousands who pass by each day see? If they drive by they see nothing. If they walk past their attention is challenged by the emptiness of the windows. Looking carefully, however, they discover that the windows are not really empty. The window on the right displays two photographs of trucks, so fly-specked as to be disgusting; an old picture of Kubelik, a battery box (dusty) and a railroad timetable. The opposite window, frosted with flyspecks, housed a list of ancient bar-

Digitized by Google

gains in second-hand automobiles, a coil box, a tire iron and a card advertising the local industrial exposition. This card had a veritable border of fly ornamentation; it looked as if it had been in the business all summer. Inside was one used car being polished. This detailed description is not exaggerated in the slightest degree. The window probably looks the same now. It was that way three weeks ago.

Inside, the floor was clean—except where oil had dripped from cars. Evidently no floor pans had been used. None were in evidence. The office was small and dark.

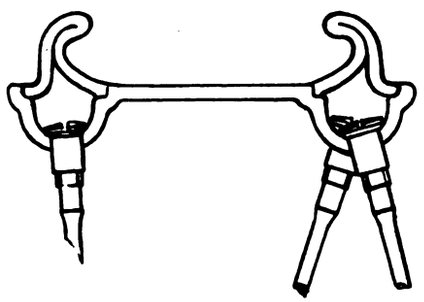
When this dealer becomes a real merchant the windows will be cleaned regularly and kept so. Cards will be clean and renewed occasionally or put under glass in a frame. It is said this man is wonderfully particular about having his demonstrators spotless. But he should not stop there, for people will look at his store as well as at the demonstrators, and both weigh up in the judgment made.

He may have done a good business, but how many sales has he failed to make because of this negative influence? It may make the difference between real cream and skimmed milk. He may have had to cut a price when with attractive surroundings and the correct background and atmosphere for his work it could have been maintained. People may have given his car second choice when it might have been their first one.

ONE FORM OF GARAGE EFFICIENCY

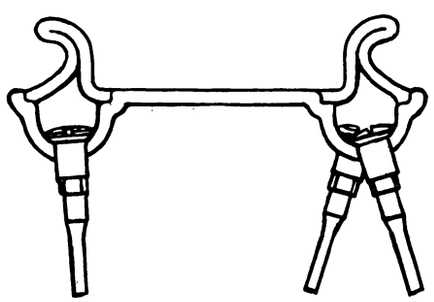
Inefficiencies, according to Harrington Emerson, the efficiency expert, include all forms of lost motion or waste of any kind, whether it be in labor or materials, in the garage or in the salesroom or anywhere in between.

An example of inefficiency in the garage is typified by the following: "Say, Bill, where is that jack?" "I don't know; you had it last." Then both commence to look for it. Two men each took seven minutes, or one quarter of an hour, at 60 cents an hour, to discover the jack necessary to make a tire chance for which a charge of 25 cents was made.



"A place for everything and everything in its place" is a simple form of garage efficiency that brings results.

Waste space is an inefficiency. Every foot of space costs money. It should be made to yield a profit. The placing and arrangement of cars, so that the greatest number can be accommodated—so that cars can be easily moved out or in and the arrangement that sets the limit of space for every car so that a regular customer knows his place by number and gets into it—no crowding and no waste space.



WIRE WHEEL MAKER ADDS NEW RIM FOR Q. D. TIRES

McCue Device Facilitates Tire Replacement and Also Increases Strength of Wheels—Felly Is Perfectly Flat.

Although it is one of the plain advantages of the detachable wire wheel that the wheel can be removed and another, mounting a fully inflated tire, put on in its place in short order, it is logical that even that advantage should be carried further, which means, briefly, that it should be easy also to replace the tire on the wheel. And in order to effect the conclusion, the McCue Co. of Buffalo, N. Y., which is so ably

McCUE WIRE WHEEL Q. D. RIM

SHOWING THE RIMS REVERSED

both fathering and mothering the wire wheel in this country, has developed for its wire wheels a new type of quick detachable rim which is calculated to increase materially the efficiency of the wheels in addition to rendering easier the changing of tires.

The principal characteristic of the new method of construction, as may be seen by the accompanying illustration, is that the portion of the wheel presented to the tire is perfectly smooth and flat, the theory of the design being plain in that the possibility of either tire or tube being cut or abrased by reason of more or less sharp projections is obviated. Incidentally, the intimate contact of the tire upon the smooth, flat surface tends to increase the coefficient of adhesion and thereby minimizes the danger of the loss of the tire under unusual conditions, such as might obtain on exceptionally rough roads.

In order to obtain the flat surface upon which the tire is fitted, the grooves to which the outer ends of the spokes are attached are rolled in the rim, which construction has the further advantage that it adds a considerable degree of stiffness to the finished product. The rolled grooves also increase the surface of the rim exposed to the air, which serves to assist in the heat radiation upon no little of the reputation of the wire wheel as a savior of tires is based. At the same time, the stiffening which results as an effect of the rolled grooves permits the construction of an exceptionally light wheel in which the factor of safety nevertheless is high. Naturally, provision for quickly and easily changing tires without the necessity for employing demountable rims, which, in a sense, defeat one of the objects of the wire wheel, also reduces the weight of the wheel at the periphery, thereby minimizing the effect of gyroscopic action and lessening the punishment to which the tires are subjected. In common with other types of Q.D. rims, the new McCue rim is reversible, to accommodate either straight-sided or clincher type tires.

Salesmen's Courtesy that is Unreal.

Many salesmen in the automobile trade acquire reputations for courtesy which, however, are not to the manner born but which are due to disinclination of car owners who are seeking new purchases to make known their identity. Very many such prospects are loth to give their names and addresses for fear of being thereafter pestered by the polite but importunate salesman. The latter, however, generally is equal to the occasion and attains his end, and at the same time impresses himself favorably on the prospective buyer.

Usually he escorts the man or woman to his or her car, which may be waiting outside the salesroom, and as often as not opens the door for him or her to enter, which act of courtesy frequently is more apparent than real, although it rarely fails to make a good impression. The real object of the salesman in doing such escort duty is to obtain a record of the license number displayed on the old car, which renders it easy to identify the prospect. When the salesman does not thus obtain the identifying number, some one else connected with the establishment performs that duty.

Decomposition Causes Combustion.

Spontaneous combustion is by no means an imaginary or even a particularly unusual phenomenon and is liable to occur wherever inflammable substances are subject to decomposition, which generates heat, under conditions which do not permit the ready dissipation of the heat.

REILLY'S ATTEMPT AT "DICTATED BUT NOT READ"

Evolves a Conspiracy Against the Sales Manager and Tells What He Thinks of Transacting Business with Stenographers—Also Criticizes the Man Who Hasn't Time to Sign His Letters.

"What the ——!" puzzled the Sales Manager.

He had read the letter twice, but he started to peruse it for the third time. Each time everything read smoothly and was intelligible until these concluding lines were reached: "I don't think the car is any good, but I'll see you after the blowout. Equip with electric horn. Will you be alone?"

The letter was followed by the signature of Reilly, and the major portion of it clearly concerned an order for a car, but the rest was mystifying; also, contrary to custom, at the lower left corner were the words, "dictated but not read."

"WHAT THE ——," PUZZLED THE SALES MANAGER

Reilly's Inexplicable Letter.

"Car isn't any good—blowout—electric horn—be alone," mused the Sales Manager. "What's got into Reilly, anyway? 'Dictated but not read,'" he continued slowly. "Something must have upset the old baldhead's mind when he sent this; it's too deep for me," he concluded, as he gave up the puzzle. "I'll ask him what it means when I go down to-morrow."

Reilly just had finished dictating a sheaf of letters the following morning when the Sales Manager appeared at the salesroom door. The two exchanged their usual friendly greetings and then, as the Sales Manager continued to stare critically at Reilly, as if he expected the latter to break into violence or something similar, the dealer exclaimed: "What are you looking at? What's the matter with you this morning?"

"Gee! but I'm glad to see you're all right!" exclaimed the Sales Manager. "Really, I'm glad."

"Better be glad you yourself are all right," was the response, "for you don't act as if you were. What's the trouble now?"

For answer the Sales Manager laid upon Reilly's desk the mysterious epistle of the day before. Reilly scanned it. "Well, what of it?" he asked as he read it. He then spent several minutes in silence as he tried to stagger through the vague paragraph near the end, but all the time there was a twinkle in his eye which, could the Sales Manager have seen it, would have led him to believe the mystery, at least in Really's mind, was very easy of solution. But the Sales Manager didn't see it.

Sales Manager Demands Explanation.

"H-m!" said Reilly. "Well," he finally exclaimed emphatically as he straightened up and pushed the letter back to the Sales Manager, "that's what comes of trying to be too up-to-date. More of the old-time stuff for me. I'm afraid I can't follow the pace."

"What's the answer?" asked the Sales Manager. "What do you mean by sending an order for a car that reads like that? Were you trying to 'kid' me, make a date with me, or what?"

"Neither. Straight business," said Reilly. "You see, it's like this," and as he continued the Sales Manager did begin to suspect that he was being "kidded," or, as the jovial Briton says, "spoofed." "It is all because I thought that stunt of yours about dictating letters but not reading them was fine up-to-date business, so I tried it the other day when I was busy, just to see if it would help me or work out to advantage. But never again! You see what happened."

Reilly Attempts to Explain.

He pressed the button which summoned the office girl and showed her the letter. "How did you come to write this?" he asked. The girl, just as if the affair had been rehearsed beforehand, gave her explanation. When he dictated the letter, Reilly, she said, had been telephoning to a friend about a combined business and pleasure engagement and she evidently had taken down words that Reilly never intended to go into the letter. Also, she added, she must have been absent-minded when she permitted them to get into the letter. But at the end she tittered a little and the Sales Manager blurted out:

"O, come off! What's the idea? I'll bite. You did that on purpose, the two of you." As he said it he grabbed a handful of freshly written letters from Reilly's desk and not one was marked "Dictated but not

Digitized by Google

read." One, however—and it was addressed to the Sales Manager—was marked "Signed in the absence of Mr. Reilly." Also it contained a clause just as mystifying as the letter which had caused the trouble.

The Sales Manager looked incriminatingly at Reilly and waited for an answer.

"Yes, Jim, I'll admit it. It's a put-up job. I did it as a gentle and covert way of expressing what I think of the way you write letters."

Criticizes the "Boss's" Letters.

As he spoke Reilly lifted from the correspondence files a bulky bundle—it was correspondence from the factory—and at the bottom of almost every letter appeared the rubber stamp "Dictated but not read." Another bundle—letters from a tire factory—were much the same.

"Did you ever stop to think, Jim, how a man might regard this style of doing business?" asked Reilly. "You come down here and I go up to the factory, and we meet on a more or less common level and chat like a couple of chums. But when you write me letters you haven't even consideration enough to give them your attention. You dictate them and half of them are signed by your stenographer and ornamented with this rubber stamp. Suppose I came to see you and, instead of seeing me, you sent the stenographer to talk to me and to convey messages which you had entrusted to her, while you never even troubled yourself to ascertain whether she handed me the correct information.

"Suppose you came down here and I did the same thing. You stroll in, for instance, and I walk into the repair shop and leave you here to talk over your business with the office girl. She probably could do it all right; but how would you like it?"

"She's a nice girl," commented the Sales Manager.

About Shifting Responsibility.

"Yes; but all joking aside, you wouldn't like it. And I don't like this way a lot of business men carry on correspondence. To my way of thinking it's absolutely offensive. And as I feel in the humor and as you invited it, I mean to give you a curtain lecture and, in advance, I forbid you to get warm under the collar. The company pays you a salary and expects you to do your duty by the company. You are supposed to be one of the principal mediums between the company and the general public. You are supposed to preserve a good front and to so handle your dealers and other men that the concern will be well thought of. You are supposed to do the right things and to be sure you are right in the things you say and do; yet here you are shifting a lot of work onto a girl who probably might be pleasant enough in personally greeting your clientele, but do you suppose the company would want a slip of a girl for a Sales Manager?

"Every time I get a letter like this one I'm inclined to think the man who sent it is lax in his affairs or doesn't care about the little details of business. In your case I know it is not so. You have seen other people do it, you probably have a stack of such letters in your files, and you have fallen into the habit. Instead of sticking around a half hour later at night you sign the letters without reading them or else the girl signs them.

Overworking Stenographer Unfair.

"Suppose something went wrong. Who's to blame? The girl, of course. She's getting, maybe, ten dollars a week and needs the money. If it was a serious mistake she'd lose her job. Then who'd be to blame? You, of course. She needs the money, and it isn't fair to make her carry so much responsibility when you are drawing a good salary for assuming it. Neither is it fair to the company for you to be slipping out from under part of the work you are supposed to be doing so well.

"To get from the factory viewpoint to mine—it makes me 'sore' to be treated with so little consideration. In a final analysis it comes down to a point where I am correct in assuming that your mental attitude is, 'Huh! it's only Reilly; I won't waste much time on him. I'll dictate what I have to say and trust to the girl to do the rest. If she gets it right, it's all right. If she doesn't—O, well, we'll fix it up some way.' You probably never have stopped to think that I might see it that way, but that's the way it looks to me.

Other Things Which It Suggests.

"These 'dictated but not read' letters always remind me of the 'E. & O. E.' excuse which accountants place on statements they are paid well to compile beyond suggestion of error or omission. 'Dictated but not read' on letters is as silly, Jim, as if the factory turned out cars bearing the nameplate 'built but not inspected' or 'inspected but not guaranteed.'

"Also, these guys who can't stick around long enough to sign their mail—they must be awfully busy men. 'Signed in the absence of Mr. So-and-So.' Huh! Sounds to me as if they made a wild dash into their offices, grabbed up a bunch of letters and telegrams, ripped them open, scattered things all over the desk, dictated answers to three girls at once and then made another wild rush across the country, leaving the letters to be 'signed in the absence of Mr. Busy Guy.' That guy needs an assistant—a very capable assistant, maybe two—or three. He ought to have enough, that's sure.

"STOP !" CRIED THE SALES MANAGER, "I'LL REFORM"

Sales Manager Capitulates.

"I wouldn't feel so badly about getting a letter from an Assistant Sales Manager, but when I'm turned over to a stenographer I quit. If you want to appear really im-

Digitized by Google

portant, Jim, why don't you get your stenographer a 'secretary' or 'private secretary' stamp and let her sign the letters with her own name. That will make people believe"——

Sales Manager Promises To Reform.

"Stop!" cried the Sales Manager, as he held up both hands with an assumed air of subjugation; "I'll reform. I'll read 'em all. I'll sign 'em all. I'll"——

"O, don't get 'sore'! I had to get it out of my system, and also I thought it would be doing you a good turn to give you a straight tip. There really are a lot of men, Jim, who feel like I do about it."

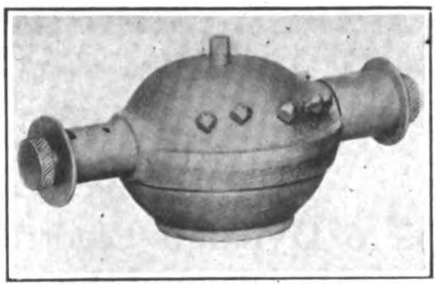
"But where, Reilly, did you get the grand idea about sending me that 'bunk' letter there?"

"That?" and Reilly laughed. "Where does a man always go when he wants a scheme that is clever and can express more concealed sarcasm and get-even-ness than he can produce himself? A woman, of course! The office girl is the mother of that. She's a regular diplomat. Isn't that so?" he asked her, as she passed through the office.

"Certainly it is," she answered, never stopping to find out what it was she was called upon to verify.

One of the Disadvantages of Kerosene.

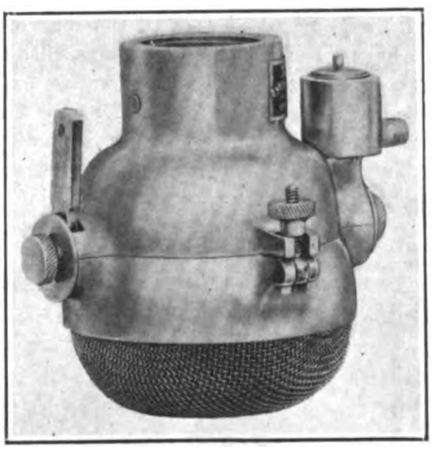
Despite the manifold advantages of commercial kerosene as a fuel, the fluid still has one marked disadvantage with which all users of kerosene lamps at one time or another have become familiar. Kerosene has a predilection to "creep"—to ooze out of almost infinitesimal openings and spread over everything it touches. Undoubtedly capillary attraction and the slow rate of evaporation has much to do with this undesirable property. But just as frequent and scrupulous cleaning has served to maintain kerosene lamps free from this kerosene "dew" which collects and encourages accumulations of dust and dirt, so may the same methods be expected to be efficacious in the case of the automobile—whether the application of the kerosene is to the lamps or to the carburetter.



Paper Bags as Fire Extinguishers.

In the testing room of the Franklin factory in Syracuse, N. Y., there is utilized a fire extinguisher which is so simple and inexpensive that it well may be adopted by every garageman or repairman in the country. Instead of the sandbox which usually is required by law, the Franklin people suspend large paper bags filled with sand at various convenient points on the premises. In the event of fire, the application of the sand is very effective.

OSCILLATING FLOAT THAT CONTROLS MULTIPLE JETS



Radical Feature of A. B. C. Carburetter—Is Also Devoid of Air Valve and Proof Against Back Firing.

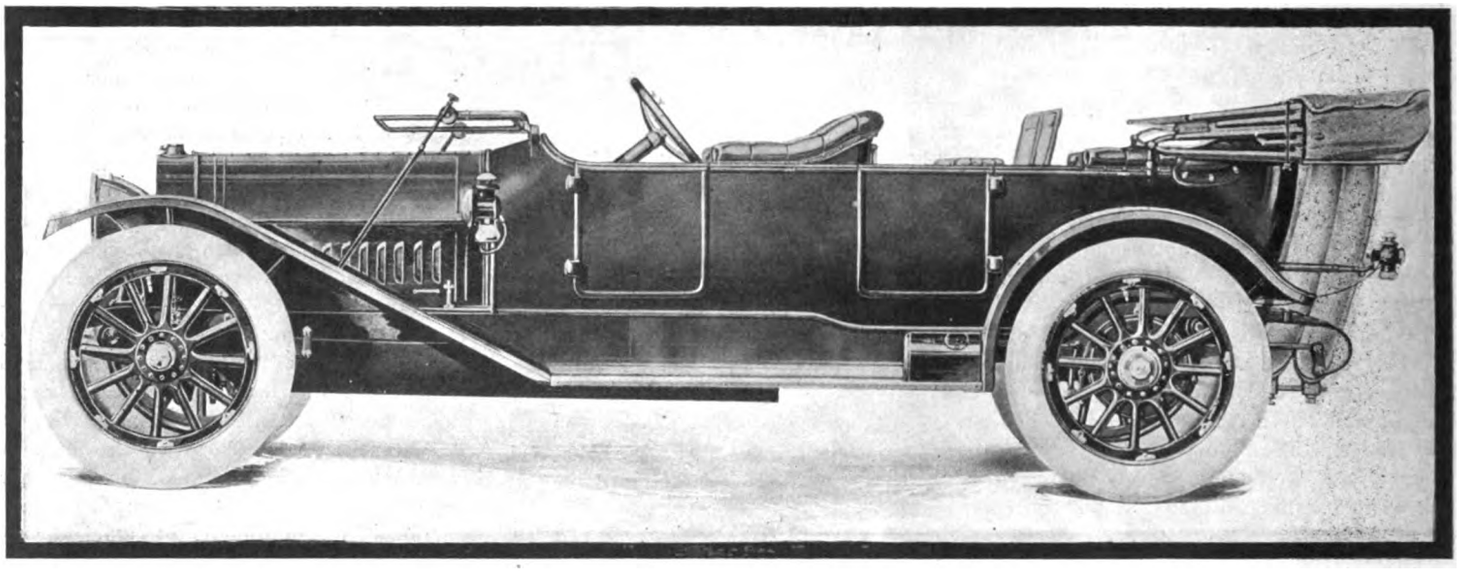
To produce a carburetter capable of thoroughly incorporating gasolene and air in unvarying proportions without regard to the engine speed and climatic changes, has been the object sought through channels many and diverse by those who have to do with the design and production of such de-

A. B. C. DETACHABLE FLOAT CHAMBER

vices, but rarely does an article of the kind come to light wherein the object is claimed to be attained with an entire absence of adjustments other than the orthodox and obviously necessary throttle. Such, however, is the claim made for the A. B. C. carburetter which just has been placed on the mar-

A. B. C. CARBURETTER, SHOWING SCREEN

ket by the International Accessories Mfg. Co., of 115 Broadway, New York City.



In principle, the carburetter is a multiple jet device, but to use a simile more expressive than apt, it is as unlike other carburetters of the type as chalk is unlike cheese. The float chamber, which is shown in one of the accompanying photographs, instead of being placed around the mixing chamber is trunnioned inside the chamber, and linked to the throttle so that it moves with the latter. Ordinarily, when the motor is operating on low speed, the float chamber is level, and the level of the fuel contained in it just reaches above the stem of one of the five jets which are positioned on one side of the chamber, so that at low speeds only the single jet is in action. As the float chamber is tipped, due to its being linked to the throttle, the stems of the other four jets are immersed in succession, for not only does the liquid creep up along the side of the chamber as it is tipped, but the level of the gasolene is raised by a cam mechanism which has to do with the float and the check valve. A sixth jet which is positioned opposite the five others come into play only when the suction of the motor creates sufficient vacuum in the mixing chamber to draw the liquid through it. All of the air which passes through the device comes into contact with the jets, passing the orifices at right angles so that an atomizing action, which it is claimed results in a thoroughly homogeneous mixture, takes place. The air which passes the jets meets absolutely no obstruction other than that offered by the position of the throttle.

Among the other claims which are made for the carburetter it is stated that flame which is propagated through the device in case of a backfire cannot possibly pass through the double copper gauze which, in the shape of an inverted dome, covers the single air inlet and which prevents the passage of the flame in exactly the same manner as the gauze in a miner's safety lamp, and at the same time prevents the ingress of dust and dirt. The entire apparatus can be disassembled for cleaning without the use of a single tool simply by unscrewing the two thumb nuts which hold the two halves of the mixing chamber together. This permits of the removal of the float chamber, which operation automatically cuts off the supply of gasolene. The fuel pipe itself need not be disconnected when the carburetter is taken apart.

The carburetter is the invention of one Elmer Smith of Bound Brook, N. J., but the device has been developed and brought to its present state during the course of the last two years by the engineer of the company, T. F. McGuire.

The officers of the International Accessories Mfg. Co., which is a $100,000 Maine corporation, are: President, William H. Fleisch, an insurance broker; vice-president, Francis G. Moore, a lawyer; treasurer, Bert K. Bloch, president of the Empire Distillery; secretary, William W. Moore, a real estate broker, all of New York City, and none of whom previously were identified with the motor industry.

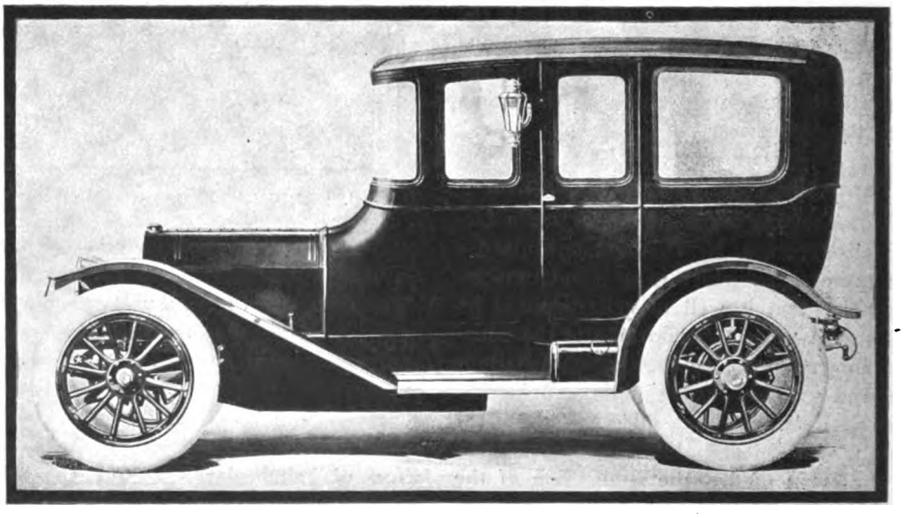
LATEST EDITION KISSEL FOUR-CYLINDER 50-HORSEPOWER MODEL, WHICH IS ELECTRICALLY LIGHTED AND STARTED

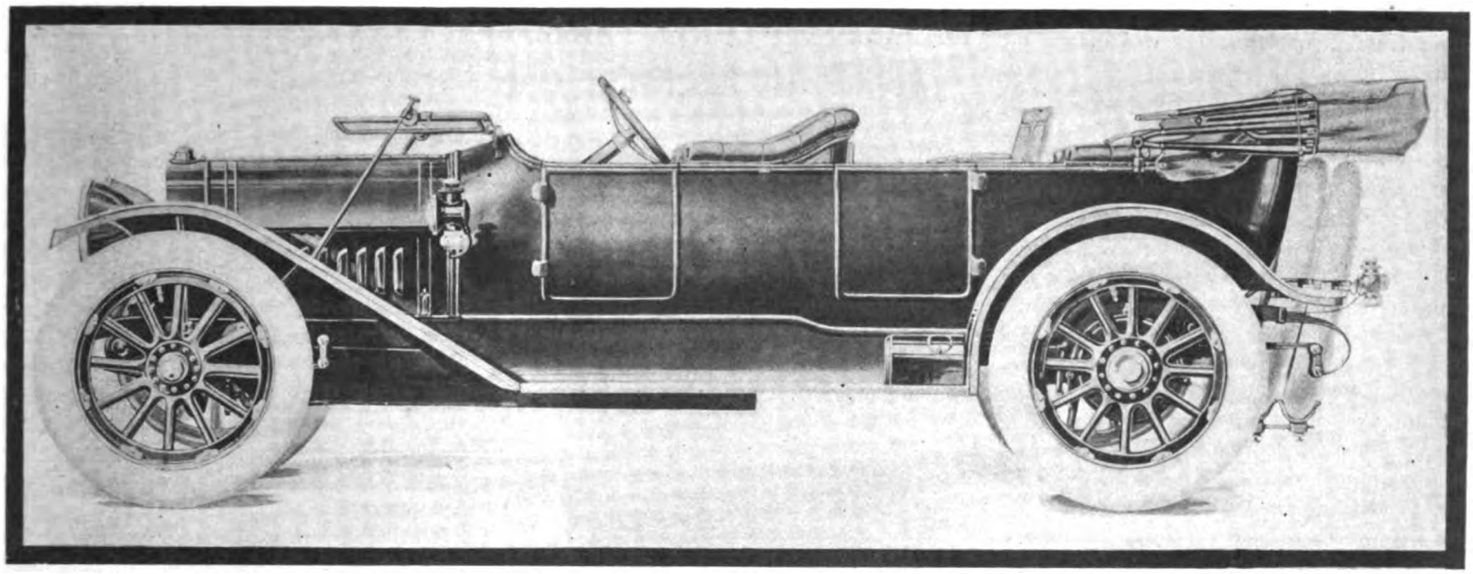
KISSEL ADOPTS ELECTRIC ENGINE STARTERS



Which Also Means a Complete Dynamo Electric Lighting System—Longer Stroke Motors for Two Models and Larger Bodies Among the Refinements—Timing Gears Replaced by "Silent" Chain.

In common with so many other well-known manufacturers who have seen the light of the times, the Kissel Motor Car Co., of Hartford and Milwaukee, Wis., has increased the value and the serviceability of its products by the addition of a complete dynamo electric lighting and engine starting system, to say nothing of a substantial increase in the dimensions of two of the motors in the line and a general refinement of design, including longer wheelbases and a well-defined endeavor to increase the comfort of the occupants of both front and rear seats.

Increased Comfort a Feature.



While there may be no hesitation on the part of intending purchasers regarding the quality of Kissel cars, it is conceivable that there might be hesitation by reason of their variety. As heretofore, there are four distinct chassis in the line, three of them being of the four-cylinder variety and mounting motors rated at 30, 40 and 50 horsepower, respectively, and the fourth being a "six," rated, conservatively, at 60 horsepower. On these four chassis there are mounted bodies in such variety as to leave little to be desired either from an esthetic point of view or from the more matter-of-fact point of view of those who desire a particular style of body for a particular purpose. The line is complete from roadster to closed-front limousine, and any of the bodies may be had on any of the chassis.

In seeking to better the line, no little attention has been centered on the bodies and on the chassis in a laudable attempt to increase their easy riding qualities. To this end, the tonneau of each of the four models have been enlarged and the cushions have been increased in thickness to 11 inches in an adaption of the French "commodite" idea. The upholstery is mounted on long, carefully-proportioned springs and the lowness of the seats serves to minimize the effect of side-sway. Naturally, the ease with which a car rides is dependent to a certain extent upon its wheelbase, and for this reason the wheelbase of the three larger models, the 40, the 50 and the 60, has been increased from 118, 124 and 132 inches to 121, 132 and 140 inches, respectively. At the same time, the spring suspension has been refined and supplemented by the addition of shock absorbers both front and rear. Another of the features which tends toward the realization of perfectly comfortable riding and a reduction of running expense lies in the adoption of large size tires, the tires on the four models measuring 34 x 4, 35 x

KISSEL 40-HORSEPOWER FIVE-PASSENGER COUPE, SHOWING BODY CURVES

Digitized by Google

SIDE VIEW OF SIX-CYLINDER 60-HORSEPOWER KISSEL IN SEVEN-PASSENGER TOURING CAR FORM

4½, 36 x 4½ and 37 x 5, respectively; demontable rims are standard.

Body Lines Devoid of Angles.

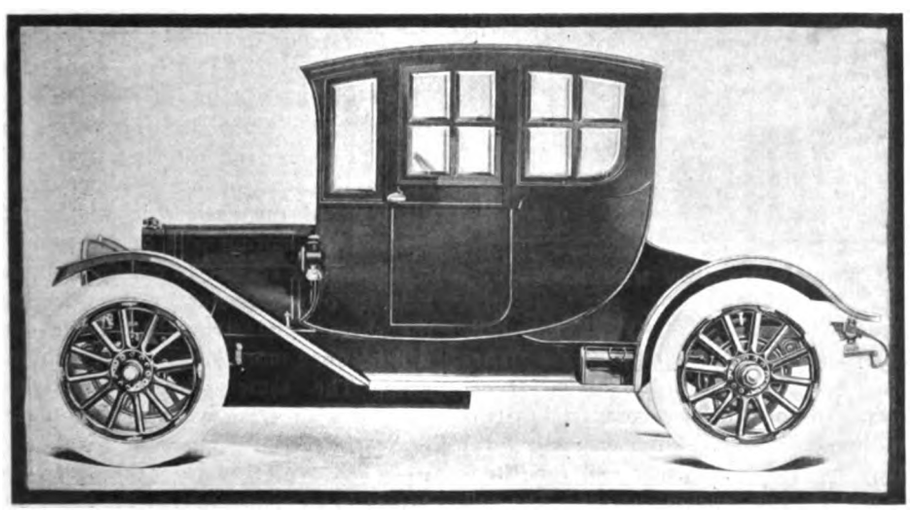
Coincident with the increase in the tonneau sizes, the dimensions of the driver's compartment in all the models also have been increased, and by way of minimizing the operator's discomfort in warm weather, dash ventilators of liberal size have been added. The control pedals have been altered slightly, so as to permit of adjustment to suit the requirements of the tall and the short. In all the body styles, the lines have been given careful supervision to ensure an harmonious exterior unmarred by angles and projecting ends, the effect being particularly noticeable in the coupe and the limousine bodies, in which the hood and short skuttle suggests not a little foreign practice.

Engine Characteristics Retained.

Except for a difference in the cylinder dimensions and the size of parts, all four motors are substantially the same, the distinctive L-head casting with the cylinders in pairs having been retained. The dimensions of the 30 and 50 horsepower motors remain the same—namely, 4¼ x 4¼ and 4⅞ x 5, respectively, although in the case of the other two an increase in size has been made which places them beyond shadow of a doubt in the long-stroke class. The bore in both of them remains the same at 4½ inches, though the stroke has been increased from 4¾ inches to 5½ inches.

"Silent" Chain for Camshaft.

Alterations in the design or construction of the motors are few and far between, and only one of them is of a radical nature. As a means of further reducing the production of unwelcome noises and to increase efficiency the gears which ordinarily drive the camshaft and the magneto shaft have been replaced by a chain of the "silent" variety. The other alteration of note concerns the lubrication system and is embraced in a refinement in the method of feeding the oil which is calculated effectually to eliminate the possibility of smoking while at the same time reducing the quantity of oil required.



The electric lighting and engine starting which forms an item of regular equipment on all of the cars, though it may be omitted at the option of the purchaser, in which case the list price of the car is reduced by $150, is complete and consists of a Ward-Leonard dynamo, an engine starting motor and a storage battery of liberal capacity. The operation of the starting motor is automatic in the full sense of the word and requires merely that a small pedal be depressed. The capacity of the motor is great enough to permit is to "spin" the engine at the rate of 75 revolutions a minute.

Clutches and Gearsets Unchanged.

In the transmission elements and the running gear little room for improvement has been found. In the 30-horsepower model the three-speed selectively operated change gear mechanism is retained without change. Similarly, the four-speed gearsets used in the three larger models have suffered no change from previous practice, third speed being direct drive and fourth speed being an overstep which permits high speed without the necessity of racing the motor at excessive speeds. Control is selective in the larger models, as it is in the small one, an orthodox side hand lever being used in all cases. All clutches are of the cone variety and are provided with cork inserts to ensure smooth action and positive grip.

Center of Gravity Kept Low.

In order to eliminate the possibility of frame weaving, the side members, which are formed of pressed steel, are heavy in section and are substantially braced; the

THIRTY-HORSEPOWER KISSEL INSIDE DRIVEN COUPE

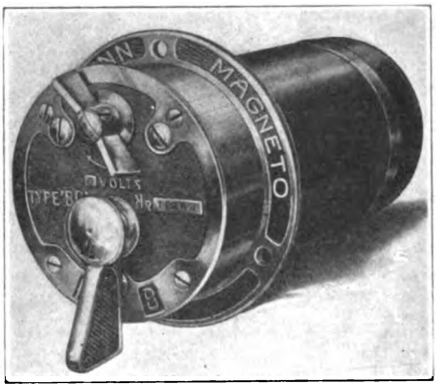
Digitized by Google

motors are supported in sub-frames in the main frames, and thus are thoroughly insulated from the effects of such slight frame distortion as may result by reason of unusually rough roads. Power is transmitted to the full-floating rear axle through the intermediary of the orthodox shaft and this, too, is protected from the effects of frame weaving by the incorporation of two universal joints, one between the motor and the gearset and the other between the gearset and the rear axle. By reason of a double drop in the frame, which serves also to lower the center of gravity of the car and thus to increase stability, the drive is in a practically straight line and the loss of power is minimized. The chassis is supported in front on semi-elliptic springs and the rear on three-quarter elliptic members.

Liberal Equipment Supplied.

As was the case with the previous models, the prices of the cars in the present series include full equipment as a matter of course and represent an increase of just $150 each over the prices which have prevailed in the past. The increase, of course, is accounted for by the addition of the electric lighting and engine starting system, which may be omitted if desired, in which case its place will be taken by a Prest-O-Lite tank with the usual complement of gas head lamps.

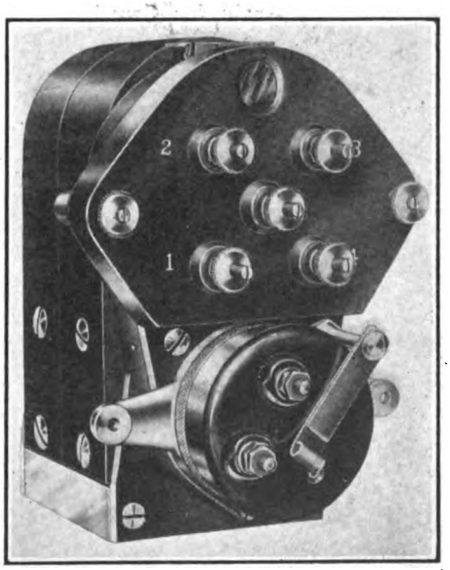
The remainder of the equipment is the same for each of the models and includes mohair or Pantasote top with slip cover and side curtains, glass front, demountable rims with one extra rim, Stewart & Clark speedometer, double tire irons, Solar lamps, robe and foot rails, and the usual jack, tools and tire repair kit. In five-passenger form, the 30-horsepower model lists at $1,700; the coupe lists at $2,750. The 40-horsepower touring car and coupe list at $2,000 and $3,000, respectively. The 50-horsepower model sells for $2,500, with touring body and $4,000 with both touring and limousine bodies, the prices of limousines including interchangeable touring bodies in every case. The six-cylinder 60-horsepower model sells for $4,650 with both touring and limousine bodies, or for $3,150 without the limousine body. With a closed-front limousine body, as well as the touring body, the price is $4,900.



When Drills Are Better Than Braces.

An ordinary brace, though by no means a suitable tool for the purpose, can be used to turn twist drills. Is is far better, however, to use a geared hand drill; a brace cannot be moved fast enough to make a small drill cut properly, and besides, there is every chance in the world for breakage; and in the case of a large drill, it is not possible to apply sufficient pressure to make the cutting edge bite into the metal.

MAGNETO AT LOWER PRICE ADDED TO EISEMANN LINE



Low Tension Generator with Separate Transformer Coil Mounted on the Dash—Simplicity and Accessibility Paramount Features.

Supplementing an already extensive line of ignition apparatus, prominent among which is its well-known automatic spark control magneto, the Eisemann Magneto Co. of 225 West 57th street, New York

DASH TRANSFORMER COIL

City, has added a brand new type which has been designed to fill the steadily increasing demand for a reliable and efficient magneto at low cost.

EISEMANN'S NEW MAGNETO

The new apparatus is styled Type E.B. high tension system, with separate transformer coil, and as its designation serves to imply, it consists of a compact low-tension generator of familiar magneto form and a separate transformer coil for "stepping up" the low tension current. The coil itself is enclosed in a tight housing attached to a plate screwed to the dash, through which the coil housing extends after the manner employed in other Eisemann systems.

Included in the housing with the coil is the ignition switch which serves to connect either the magneto direct to the transformer coil and thence to the spark plugs, or a set of dry cells to the coil. In order to ensure positive starting "on the spark," the coil housing also encloses a ratchet device, operated by a small handle on the dash plate, for the manual generation of the initial spark. Immediately the engine takes up its cycle of operation, it is sparked from the battery, a kick switch serving to disconnect the battery and connect the magneto direct.

Throughout the system cognizance has been taken of the desirability of maximum simplicity and accessibility, and to this end all extraneous parts have been carefully eliminated from the design. One of the noteworthy features of the apparatus is that the make and break mechanism can be removed entire without the necessity for the use of any tools whatsoever. The new E.B. system, as already mentioned, is an addition to the other Eisemann products, the making and marketing of which just has been materially facilitated by occupancy of a new factory which will permit the output to be increased considerably.

Snaps That Reveal Broken Washers.

Lock washers or "spring" washers not infrequently snap either because they are a little too hard or because of some defect in the metal, when a nut is forced down to a bed. Sometimes the snap is audible, sometimes it can be felt as the wrench moves. and sometimes the break can be discovered only by looking for it. A broken lock washer has some holding power, but not nearly as much as an unbroken one, and therefore should be replaced without unnecessary delay.

Increasing Usefulness of Reamers.

An old shop trick that frequently is useful when it is desired to ream a hole slightly larger than a given sized reamer, is to insert the reamer and with it a strip of sheet metal—tin, iron or brass—about half the diameter of the reamer in width and as long as the cutting part of the tool. This will force the reamer to cut the hole larger than its own diameter by the thickness of the sheet metal strip, though the cutting will be done more slowly than without the strip. The same scheme sometimes is worked with a tap when a very slight increase in thread diameter is required; but it is not a particularly good thing to do except in an emergency, as the effect on the threads is not good.

DEALER WHO BUILT BUSINESS THROUGH SERVICE

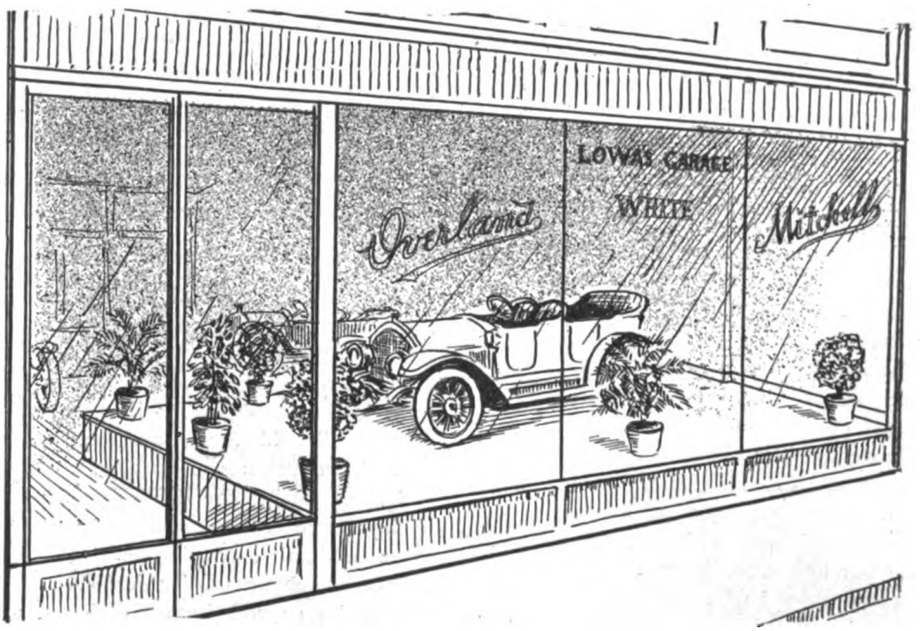
Yonkers Man Who Is Ever Alert to Please Owners of Cars—No Charge for Small Jobs Is Money Gained in the End—Couples Modern Methods with "Don't Get Rich too Quick" Policy.

Selling automobiles as a livelihood brings success to some men and failure to others; operating a garage does likewise. Combining the two would seem a way to assure success, yet the trade furnishes innumerable instances of those who have utterly failed in this line of endeavor. One man, however, who has won out in a striking manner is William Lowa, who, with his son, Charles W. Lowa, conducts business at 197 South Broadway, Yonkers, N. Y., which directly adjoins New York City on the north. The Lowas have made and are making money. They operate a garage that is not losing money and separately, but within a stone's throw of the garage, they maintain a salesroom from which a substantial revenue is derived through the sale of cars.

The Lowas and their methods constitute one of those good examples from which any man who seeks to do so can obtain helpful instruction.

Example of Single Order.

Aggressiveness, a quality which has pulled many sinking firms to solid ground, characterizes the Lowa methods throughout; slipshod processes, instead of having been eliminated, never prevailed. The Lowas handle the Overland, White, Mitchell and Haynes lines, and an instance of their effectiveness is furnished by a single order they are now filling for the city of three fire chiefs' runabouts, a police patrol, an ambulance and a three-ton truck—all Whites. This small fleet when in service will be no insignificant advertisement for the Lowa business.



Attractive Salesroom Draws Trade.

That careful planning enters into the sales scheme of the firm is illustrated by the manner in which they have transformed an otherwise mediocre salesroom into an attractive establishment; the front, 35 feet in length, has capacious windows which, however, reach only to within some 15 inches of the floor. A car standing upon the floor would be on the street level and therefore partly lost to view; to render it conspicuous a platform about 15 inches high has been constructed, and on this the display car stands on a level with the bottom of the big panes of glass. While the idea is not new, its effectiveness is ably demonstrated and may "suggest things" to other dealers.

Having brought the car into a position of prominence on the platform, it is made more attractive by the use of palms, ferns and other potted plants. Through the edging of plants, other cars are discernible on the store floor and, once inside, a prospective buyer feels secure from the gaze of passers-by and almost experiences a sense of coziness.

Solving Demonstrator Problem.

Lowa meets the demonstration problem in a unique way. He does not merely sell his demonstrators as used cars at poorhouse prices. When he places a demonstrator in service it actually goes into service, which is to say that, in addition to being used to demonstrate the line, it forms a part of a small fleet of livery cars operated by Lowa, and at the same time that it is depreciating in value it is earning the amount it is depreciating. When it has done service until it no longer is presentable as a demonstrator, it either is kept in the livery service a while longer or is sold at a reduced price and a new demonstrator is secured. In any event, the car has been made to give nearly a full return for its value.

RAISED PLATFORM AS A SALESROOM IMPROVEMENT

On the used car question the Lowas pursue what many regard as the only sensible method. They will not allow for a used car a price that they know they themselves cannot get for it. Once taken, however, they are resold as they stand, either to a local purchaser or to the "scrap heap."

"Scrap heap? What's that?" inquired the Motor World man who was talking with the elder Lowa.

"It's that bunch of 'used car' houses in New York," he replied. "Those houses buy the old cars and ship them out West or somewhere else and sell them. But we generally get our money. We make a price that we know we can get from somebody and sometimes we make a little more; sometimes it is a little less, but never very much."

Regular Mailing System Adopted.

But the selling plan of this dealer-garageman goes further back than salesroom decorations and theories; it finds root in a fundamental principle of true dealership—and that is service and appreciation of the value of good will. The great majority of the firm's sales are directly traceable to the recommendations of satisfied owners. The Lowas have a regular system of selecting men of means who are able to own a

Digitized by Google

car and mailing them catalogs and other printed matter. Also, they follow up names received of the factories to which inquiries have been addressed for catalogs. But the service link is the big factor in piling up the Lowa profits.

Free Service That Earns Good Will.

To illustrate: One Sunday not long ago a man driving a new White touring car pulled up at the Lowa garage. He said he was a novice and was sure there was something wrong, because all the way out from New York he had been unable to obtain speed or power from the car. Lowa directed one of the three capable mechanics he employs to ascertain the trouble. The mechanic drove the car, returned to the garage, adjusted the carburetter, having found the air supply was deficient, and inside half an hour the White owner was in good humor. "How much?" he asked. "Nothing," replied Lowa, but the owner insisted on paying a dollar. The garageman flatly refused, and the owner went on his way a much pleased man. This treatment is accorded to all of Lowa's customers, and he is a good Samaritan to every owner of a car of the lines he represents—often to others.

"Get Rich Quick" Wrong Policy.

"The trouble with many dealers and garagemen," said Lowa, "is that they want to get rich too quick. When one does a little job for an owner that costs something like 15 cents, what is the use of charging him 50 cents? Let it go. Some time he will come in with a real job of work, and then he is only too glad to pay your price. If one of our customers says he has trouble we have him bring in his car and we go over it from end to end. If there is any repair work of consequence we charge for it, otherwise we return the car to the owner with our best compliments. It is one way of earning good will. It keeps our owners satisfied and brings us more sales. Often an owner will come to us and inform us of someone who is thinking of buying a car and to whom the owner has recommended one of our cars, and a sale results. It is merely a way in which intangible good will is turned into real money."

Local Papers Used for Publicity.

Other prospective buyers are secured through the firm's advertising in Yonkers papers. Ordinarily two papers are used, on alternate days. The regular space is one-column, six inches, and the cost totals $600 or $700 a year, all on contract. Lately three papers have been utilized. The Lowas are firm believers in advertising, and they employ it in every reasonable way.

And while prosecuting their sales business their garage is not neglected. The Lowas began business several years ago with a garage on Riverdale avenue, which is not the main street, but later acquired the present place, which is on the main thoroughfare of the town and on which the traffic is heavy. During evening and on Sundays there is an unending procession of cars going in both directions to and from the great metropolis which is Yonkers's next door neighbor.

Nearby Restaurant Aids Garage.

Across the street from Lowa's garage is a restaurant which is famed among motorists who drive through Yonkers, and on Sundays and on other afternoons it is not infrequent to see a line of 25 or 30 cars lined up around the triangle on which the restaurant stands. This eating place brings trade to the garage. Motorists who stop there often fill up their gasolene tanks before starting, put in an extra inner tube or renew some of their supplies.

The price of gasolene is 20 cents a gallon, although it is bought for 16 cents. This is a profit of 25 per cent., and in the first eight months of the year the Lowas paid $11,000 for gasolene, thereby netting $2,750. Their bill for tires and tubes between March 1 and September 1, this year, was $35,000, while they bought $2,000 worth of oil, using a good grade only.

Storage Poor Revenue Producer.

Storage is a part of the business, although it is not a big revenue producer. Rates range from $15 and $20 for small runabouts and touring cars to $25 for large touring cars and $30 for limousines. The garage will hold 25 cars, and generally it is full. Three men are employed at night and three during the day to care for this business, and in the daytime, also, there are three mechanics, drawing $4.50 a day, and four or five chauffeurs for the livery service. The entire payroll from March 1 to September 1 was $11,000. Of the Lowa family, the father and son are at the head of the business, one daughter cares for the garage office, another is in the salesroom office, while a nephew of the elder Lowa is the bookkeeper.

Tire Inflation Service Brings Custom.

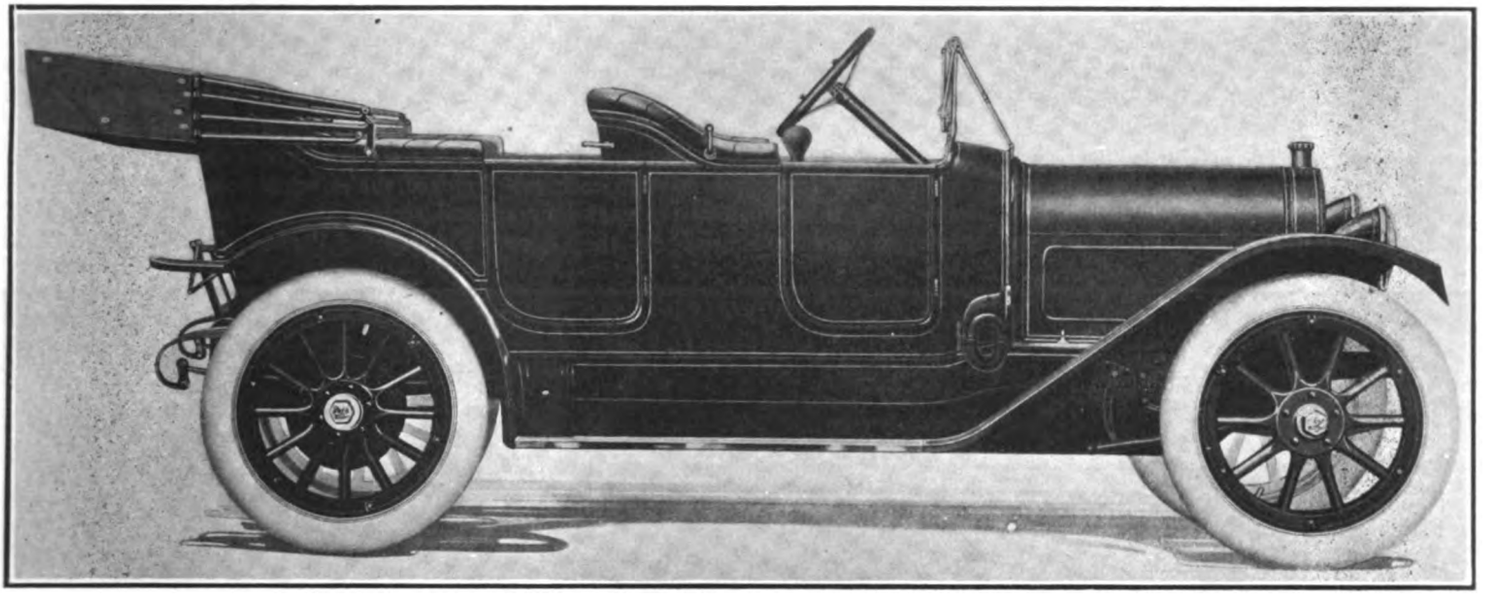
A drawing card of the garage is its "air service." It is the only place in Yonkers possessing an automatic pump, which is much more to the liking of a motorist than using a hand pump by a dusty roadside. The charge for filling is 10 cents per tire.

The advantage of a location on the main street and the following up of these natural leads to business are productive of results. There now are something like eight garages in Yonkers, which city has a population of about 80,000. Of these about half change hands every few years, which is construed as evidence of lack of profit to the owner. The Lowas, however, have been there seven years. May 1 they rented, in a new building, the salesroom—that in which they installed the raised platform. This is but a few doors from their garage and is conveniently located. Before that time they had been obliged to display their cars as best they could in a part of the garage. Now they expect increased sales because of the change. The first year they were on Broadway they sold 246 new and used cars. Sales now are about 250 cars a year, including the used models taken in trade.

Genialty in meeting the trade also is an asset. Both father and son are agreeable and well liked and conduct their entire business with the idea in mind that it is better to please and stand well with the public than to grab a cent every time a customer is found in possession of it.

Remedying Inaccessible Greasers.

It is worse than useless to provide a hole for oil if it is unprotected and nearly as bad to place oil cups in inaccessible places, or grease cups that from their very position are more often than not covered with caked mud. Whenever a repairman is called upon to loosen a "frozen" brake rod or any similar part that has suffered for want of lubricant, he should not consider his job complete unless he has made provision that the trouble will not recur.



Flexible metal tubing can be had in almost any diameter and grease cups that otherwise are entirely out of reach after the body has been mounted can be so conveniently placed as to ensure attention if a small length of tubing is interposed between the point to be lubricated and the altered position of the cup. First take a short length of brass or copper tube and thread it at one end the same as the grease cup. Insert same in the hole from which the grease cup has been taken, after having sweated the unthreaded end into the flexible tube. Then the grease cup shank can be sweated into the other and, and either the cup or the tube can then be attached by means of a clamp to some convenient point.

Flexible tubing alone is not the only thing than can be used, as ordinary brass or copper tube will in many cases answer the purpose just as well. If these latter are used and any length of pipe over—say, four inches—is found necessary, a stay or support should be provided to prevent them shaking loose or breaking off owing to excessive vibration.

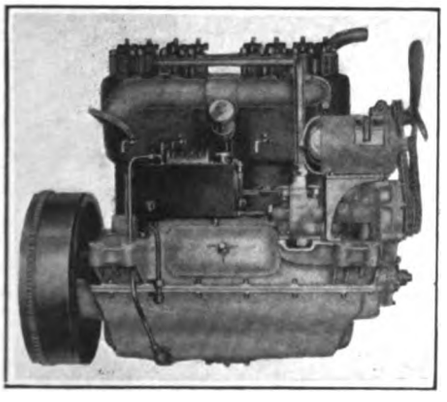
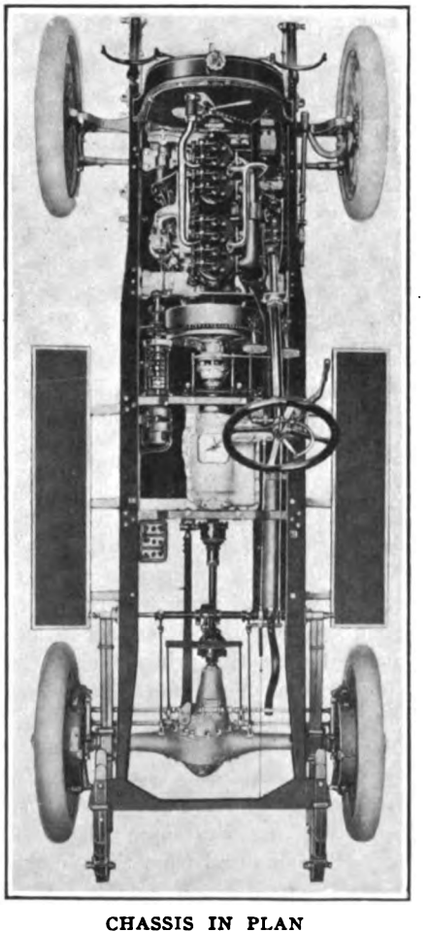
SMALLER MODEL ADDED TO POPE-HARTFORD LINE



Follows Design of Larger Models, Including Four-Speed Gearset—All Models Electrically Started and Lighted—Roller Gearshaft Bearings and Other Detail Improvements.

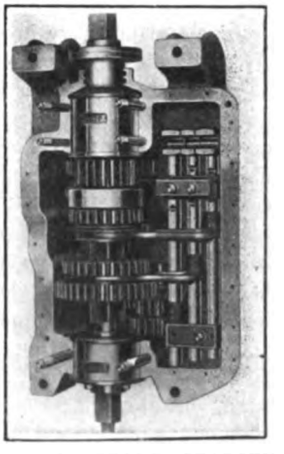
NEW FIVE-PASSENGER POPE-HARTFORD MODEL THAT SELLS FOR $2,250 WITH ELECTRIC LIGHTING AND STARTING SYSTEM



Already well heralded, the medium priced Pope-Hartford car, which has been added to the line of the Pope Mfg. Co., of Hartford, Conn., now formally is being introduced, and proves to be a worthy compeer of the two older models which constitute the Pope-Hartford line.

The new machine is a four-cylinder car

POPE ENGINE SHOWING DYNAMO



of smaller size, lower horsepower and lower price than either of the others, being rated at 40 horsepower, while the larger machines, a four and a six, are of 50 and 60 horsepower, respectively. Model 31 is the designation of the latest product of this famous concern, and the price is $2,250. The larger four and the six are designated

CHASSIS IN PLAN

as models 33 and 29, respectively, and are priced at $3,250 and $4,250. Either roadster or touring bodies are mounted, in all three cases, without change of price.

The addition of the new model has not been accompanied by the making of ex-

POPE-HARTFORD GEARSET

tensive changes in Pope-Hartford design or construction; on the contrary, the mechanical features that have been so successful in the past have been very closely adhered to, not only in the two larger cars, which are continued almost without change, but also in the new chassis, which is practically a duplicate of the 50-horsepower car in

Digitized by Google

everything, except dimensions. Even the "six," which now is in its third year, embodies the same mechanical features as the two fours. All three have valves in the cylinder heads with overhead actuating mechanism, four-speed gearsets, selectively controlled, and shaft drive, and rear axles of the full floating type.

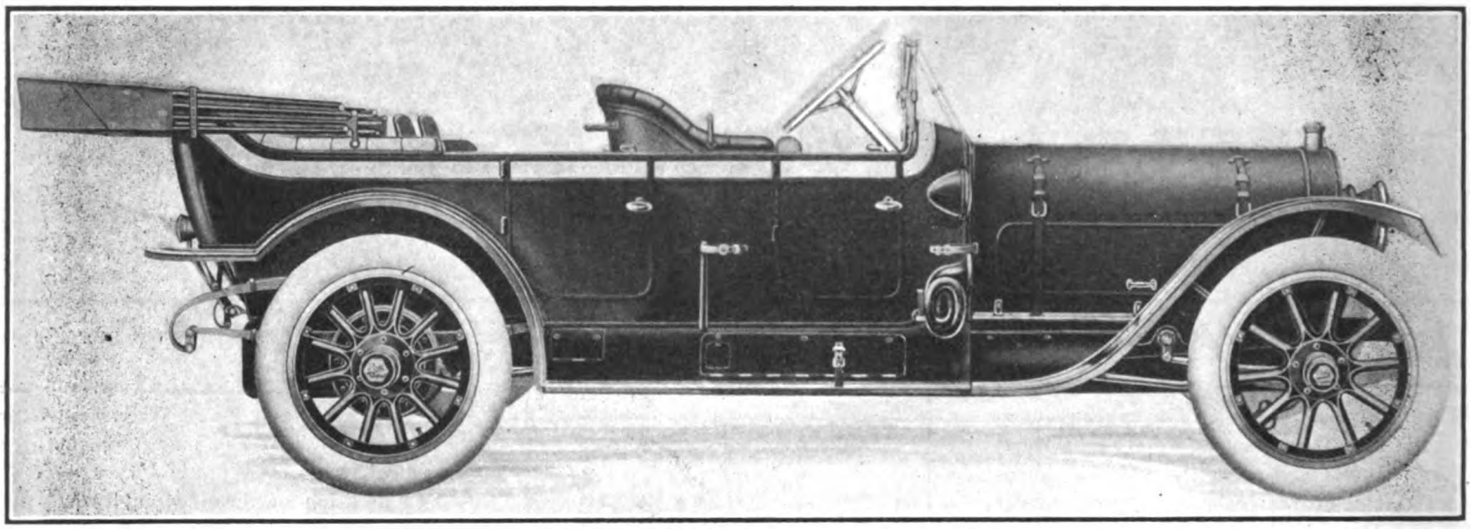
A Replica of Larger Model.

During the general critical looking over that the cars received with a view to bringing them absolutely up to date and to make very sure that the new model was not invested with features that would prove unworthy of its name, little fault was found. As a matter of fact, the only important thing that seemed lacking was a substitute for the crank. While various types of motor starters have been more or less widely used and with more or less success for some little time, the Pope company has maintained an attitude of conservatism—not of the idle sort, however, for extensive experiments have been carried on with a view to the abolishment of human muscle as a starting agent. The result is seen in the equipment of all the latest Pope-Hartfords with Gray & Davis electric starting and lighting systems as standard outfit.

Adopt Electric Starter as Standard.

That here and there details have been slightly changed with a view to rendering more effective features that already have proved worthy of incorporation in Pope-Hartfords goes without saying. Such a change is found in the substitution of large roller bearings for plain bearings for the support of the shafts in the gearbox, and in the narrowing of the front of the improved double-drop frame, in order to facilitate turning short, as well as other things of comparatively little importance individually, but of considerable importance in the aggregate.

As already indicated, all three cars are much alike in general principles, and one general description fits all three. The motors, which are of the long stroke type, are built with pair-cast cylinders with integral water-jackets, and overhead gear operating valves in the cylinder heads through long push-rods and rockers; the valves are of chrome-nickel steel. All the valves are on one side, and a single camshaft carries all the cams, which are integrally formed with the shaft. Particular attention has been given to the cutting of the timing gears, which run with extreme quietness. A mechanical oiler forces lubricant to each cylinder. Gas is supplied to the engine by a carburetter manufactured at the Pope works; it has but a single adjustment. Ignition is by Bosch dual system, with high-tension magneto for ordinary running and a storage battery as a source of current for starting and for emergency service.



Modification in Gearset and Frame.

The leather-faced cone clutch, which is of liberal diameter, is equipped with cork inserts, and it is connected with the primary shaft of the transmission by a coupling of special design, with large wearing surfaces. An efficient clutch brake aids very greatly in the changing of gears by preventing the rattling and grating that ensues if the shift is made before the primary shaft, which the momentum of the clutch tends to keep turning, has slowed down.

Direct drive is on the fourth speed of the gearset. All gears and the gear-shafts are of chrome-nickel steel and run in a bath of oil. The propeller shaft through which power is transmitted from the tail-shaft of the gearset to the rear axle is fitted with two universal joints. The rear axle is of the full-floating type; roller bearings carry the pinion shaft.

Frame Reinforced by Ash Inserts.

Re-enforcements of tough ash are added to the heat-treated chrome nickel steel channel members of the main frames, which are double dropped and narrowed considerably at the front to provide room for the front wheels in making short turns; the various frame members are thoroughly braced and hot-riveted together. Three-quarter elliptic springs support the rear of the chassis, while the front end is carried on semi-elliptics, all long and flexible. Positively irreversible steering gear is employed, the principle being that of the worm and sector; the mechanism is enclosed in a dust-proof casing. The wheel, no less than 19 inches in diameter, has a rim of mahogany and is mounted on a column 1¼ inches in diameter. Spark and throttle levers are mounted on top of the wheel, working on a single sector. The usual pedal accelerator is fitted. All control levers are inside the body, on the right side.

SIDE VIEW OF STANDARD SIX-CYLINDER SEVEN-PASSENGER POPE-HARTFORD TOURING CAR

Large Tires and Metal Bodies.

Both of the four-cylinder models are equipped with 36-inch wheels with 4½-inch tires all round, while the six has 37-inch wheels and 5-inch tires. The wheelbase of the new car is 118 inches; of the other four 124 inches—the same as its predecessor—while the wheelbase of the six has been shortened by an inch, now being 133 inches. In all cases the tread is 56 inches.

The bodies in all models are of metal construction, with moderately deep skuttles and mahogany dashboards. Running-boards and mudguards are of ample width and fitted with suitable wings to keep down flying mud when the roads are in bad condition.

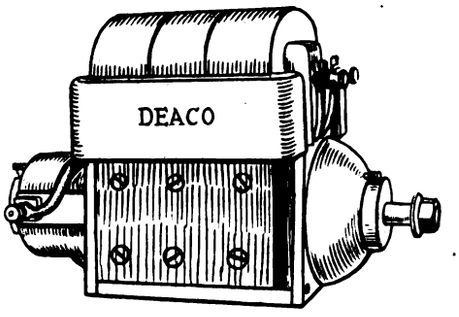
LIFTING THE FOG FROM THE LIGHTING SYSTEM

Wherein Different Apparatus Differs with Particular Reference to Current and Voltage Regulating Devices—Necessity for System in Searching for Trouble—The Dealer in the Light of a Doctor.

(This is the sixth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by dealer and owner alike.)



In the curriculum of every school of medicine there is a class devoted to dissection. It is an analytical class in which the structures of inanimate, and sometimes animate, creatures are taken apart and torn down in order that their characteristics and their functioning may be examined and learned by a body of young medicos whose future work will be the curing of human ailments. But before they can cure such ailments, it is absolutely essential that they learn thoroughly the construction and work of every organ, for in the learning comes knowledge of those organs that, under normal or abnormal conditions, are most likely to cause that condition of physical ill-being that results in the necessity for their healing administrations. In other words, they learn through constant association and intimate contact with ligaments and tissues, "liver and lights," the parts which seldom give trouble and normally should be let severely alone, and the parts which are most prolific of derangements.

Analytical Learning Is Helpful.

To make a long jump from one subject to another, though the linkage should be quite apparent, knowledge of the modern electric lighting system rightfully should be gained in much the same manner. The student of the system, or the owner, or the dealer—and the dealer in particular, for in the majority of cases he is looked upon as being the real "doctor" when minor or major troubles evidence themselves—ought to learn of the system through methods much akin to those which obtain in the case of the embryo M. D. He ought to be taught, first of all, its theory and afterward its practice; then, with a course of dissection and consequent reconstruction, he ought to be fairly well equipped to cope with very nearly any trouble that might arise.

Dynamos and Hearts Contrasted.

Fortunately, however, such thorough courses in training are unnecessary, though they nevertheless are desirable and will do a great deal more good than harm. The builder of the modern electric lighting system has builded his product well; unlike the human frame, it is not subject to unaccountable ailments; it has no digestive organs, no intestines, no lungs, and is endowed with endurance that is remarkable. But it has a heart. In electrical engineer's parlance it is styled a dynamo. The heart of the electric lighting system is like the human heart in at least one respect: If it is not abused, it will continue to perform its alloted work until it wears out. To obviate the possibility of inadvertent abuse, a knowledge of the construction and working of the "heart" is necessary. In the last five issues of the Motor World there have been outlined many methods whereby thoughtless abuse of a number of electric lighting systems can be obviated and such troubles as may arise by reason of wear may be remedied. In the present article, a number of other systems are similarly treated—for the edification and education of the dealer and the owner—and the series will be continued until all of them have been covered.

DEACO GENERATOR IN PERSPECTIVE

Compactness Means Simplicity.

If there is any one thing which tends to prove more than another the real simplicity of very nearly all electric lighting systems, it is their compactness. While it is perfectly true that a watch is a more than ordinarily compact pieec of mechanism, that is very far from being simple, its complexity is due to its great number of very small and intricate pieces. With the lighting generator, on the other hand, the parts are few—in many of them there is but a single moving part—and they are fairly large and of rugged construction. The only parts that might, perhaps, be styled complex are the field and armature windings, but the complexity of these parts need never concern the dealer or the user, for the simple reason that they are so constructed that they never require attention except under most extraordinary conditions. Otherwise they can be forgotten completely. The rest of the machine is simple, or becomes simple after superficial examination. The great difficulty is to get dealers and owners to make the examination, however, despite the fact that it manifestly is to their own advantage more than to any one else's to do so. Even in the few cases where the functions of an electric lighting generator are combined in a single instrument with those of a high tension magneto, construction—and operation—still remains simple, vide the accompanying cross-sectional view of the Deaco combined generator and magneto.

Combined Magneto and Dynamo.

The Detroit Electric Appliance Co., of Detroit, Mich., is among the very few manufacturers that attempt the production of a combined instrument of this type. The magneto portion of the generator is orthodox and differs but little from generally accepted magneto design, though the low tension generating part of the machine is quite different from anything else of its kind, particularly in the method of current regulation. Two styles of instruments are manufactured, the one being the combination magneto-generator shown in cross-section and the other being a plain lighting generator which is exactly similar to the first, except that the ignition apparatus is left off. Consequently, the cross-sectional view of the former will serve to assist in describing the operation and care and repair of the latter.

Operation of Compound Field.

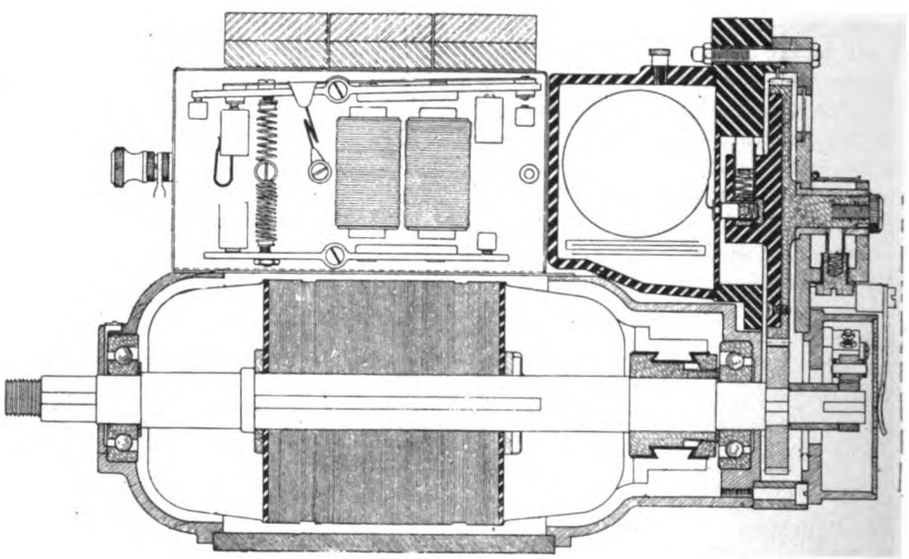
The field of the lighting generator is a compound one formed in part by three pairs of permanent magnets supplemented by windings which serve to increase the current strength at low speeds and also to permit of current regulation in a manner that leaves little to be desired. The armature is of the drum wound type, wound with cotton covered enamel wire and afterward impregnated with an insulating compound and baked; it therefore is practically inde-

Digitized by Google

structible and never requires attention. Similarly, the field winding is practically solid and is encased in a tight housing which precludes the possibility of it being damaged. The current regulator is an electro-magnetic device, and this also is thoroughly protected. It is enclosed in a housing mounted within the arch of the permanent magnets. The whole device consists of a pair of electro-magnets, connected in series with the line, operating a pair of spring-returned armatures mounting the contacts necessary to obtain the various degrees of current strength.

How the Regulator Regulates.

In operation, as soon as the engine is started and the armature commences to rotate, current is generated. The field of the dynamo then consists of the permanent magnets assisted by the field winding which operates to increase the field strength and therefore to increase the current output at low speeds. As the speed of the armature is increased, one of the electro-magnet armatures is attracted to its core and thus alters the connections so that the field winding is cut out entirely, leaving the field composed of the permanent magnets alone. As the armature speed is further increased connections automatically are made which permit a small part of the current generated to flow through the field windings in the reverse direction, thus weakening the field and maintaining the current constant. At still higher speeds, the full strength of the current is passed through the field windings in the reverse direction, still further reducing the strength of the field and permitting the generation of only a predetermined amount of current. The exact amount generated may be adjusted to a nicety by increasing or decreasing the strength of the springs which return the electro-magnet armatures to their normal position. The arrangement of the parts is shown by the accompanying cross-sectional drawing.



Care That Is Needed in Use.

In caring for the mechanism, it will be necessary, of course, in order to ensure its automatic operation to make sure that the electro-magnetic regulator is performing its functions. The contacts should be examined from time to time, and if they show signs of burning or pitting, or if they are dirty, they should be cleaned with the aid of a couple of strips of very fine emery cloth glued to the opposite sides of a piece of very thin Bristol board. Care should be taken, however, not to remove too much metal or the adjustment will be altered. Provision for taking up for wear is made, and the only tools required are a couple of screwdrivers. Needless to add, the interior of the regulator housing should be cleaned out and all accumulations of dust and dirt removed carefully with the aid of a fine camel's hair brush. About once in six months it will do no harm to place a tiny drop of typewriter oil on the bearings that support the moving parts. Under no consideration should oil be placed on the contacts, and care should be taken to see that not enough oil is employed on the bearings to allow any to get on the contacts. Oil is a non-conductor of electricity, and its presence on contacts spells trouble with a capital T.

Inasmuch as the armature shaft runs in ball bearings of liberal size and friction is reduced to the minimum, lubrication should also be reduced to the minimum, which means a few drops of typewriter oil or fine machine oil about every couple of thousand miles. Typewriter oil is recommended in this connection for the reason that typewriter manufacturers have been at great pains to develop a lubricant which will serve its purpose without causing excessive accumulations of dirt and without "gumming." Fatty oils derived from animal matter are inclined to "gum" up the bearings and also are likely to contain acids which will cause corrosion of the bearings. For this reason only the very best oil should be used, and it should be used only in limited quantities to obviate danger of its reaching the commutator, in which case poor commutation will result and the output of the generator be reduced.

Need for Proper Commutation.

Due to the rugged construction of the commutator and the brushes, little trouble is likely to develop, provided these parts are properly cared for. The brushes should be examined from time to time and cleaned with a cloth moistened with gasolene to remove oil and grease which may have accumulated. Care should be taken to see that the brushes press firmly on the commutator, and when they have become worn so that the tension of the spring is less than it should be they should be replaced with new ones. The cost of such replacement is but a few cents and often may be the saving of the commutator, for it is a well-known fact that brushes which touch the commutator too lightly to effect proper commutation but not lightly enough to prevent the machine generating are the most prolific causes of commutator trouble. Sparking burns the brushes and the commutator, and generally can be traced to insufficient tension on the brush springs, a dirty commutator or dirty brushes. If the commutator shows signs of scratching the brushes first should be examined to make sure that no hard particles of carbon are present. If the brushes are smooth, very fine sandpaper—about No. 00—may be pressed lightly on the commutator while the machine is running. Emery cloth never should be used for this purpose, for minute grains of emery are likely to imbed themselves in the comparatively soft copper and play havoc with the brushes.

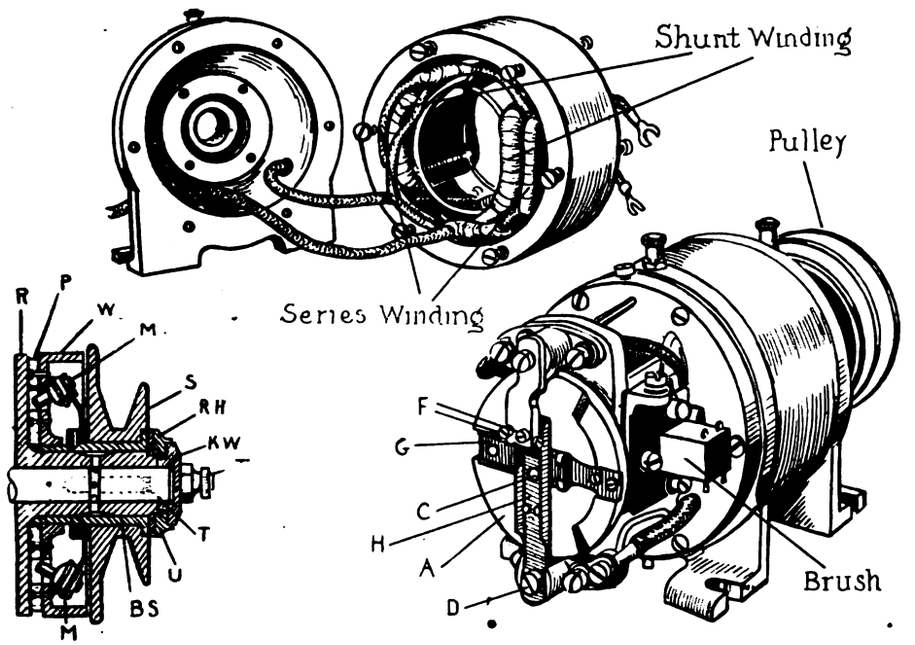
DEACO MAGNETO-DYNAMO IN SECTION, SHOWING REGULATING DEVICE

Magnetic Cut-Out Characteristics.

The automatic cut-out in the Deaco system is an electro-magnetic device consisting of two windings and a spring-returned armature. The armature carries one of the contacts with which connection between the dynamo and the battery is established or broken. The other contact is stationary. In operation, the cut-out makes connection between between the dynamo and the battery when the current generated by the former exceeds that of the latter. Immediately the current of the battery exceeds the generated current, as when the engine is stopped or when the armature speed is

Digitized by Google

not sufficient to cause the generation of sufficient current, connection automatically is broken. There is nothing in the device to get out of order and, provided care is taken to see that the contacts are kept clean and the armature bearing does not become stuck, preventing the operation of the device, it should never give trouble. Approximately once in six months a single drop of typewriter oil on the bearing of the movable arm will be sufficient lubrication.



Where Wires May Be Shifted.

One of the noteworthy and characteristic features of the Dynalux system, manufactured by Dean Electric Co., of Elyria, O., is that the dynamo may be connected to the battery without regard to the polarity of either. Thus, it is not necessary to connect the positive wire from the dynamo to the positive terminal of the battery, and vice versa; either wire may be connected to either terminal without discrimination. As a result, the likelihood of confusion is eliminated, as is the danger of damage resulting to the battery by reason of incorrect connections being made through ignorance or mistake.

Differential Regulation Obtained.

The component parts of the Dynalux dynado are shown herewith in partly disassembled form in order the better to make plain their features. The field is compound wound, the series winding being outside the shunt winding in order to obtain a differential effect in regulation. The whole mechanism, including the driving pulley and the automatic cut-out, is completely enclosed by means of a light removable cover, and though it thus is thoroughly protected and is very nearly dust and dirt proof, it is impossible effectually to close all interstices, and it is the better part of wisdom occasionally to remove the cover and carefully clean out all accumulations of dirt and carbon dust from between the windings with the aid of a soft brush. The brushes, of course, will wear in time, and unless the carbon dust from them is removed periodically it is likely to accumulate in such quantity in time as to hinder the proper operation of the machine.

In addition to the electrical self-regulating feature, which is entirely automatic and is dependent upon no outside agency whatever, another regulating device is incorporated in the driving pulley, which is so arranged as to permit practically constant speed driving without continual slippage of the parts and the attendant wear which takes place under such conditions. The pulley, illustrated in section herewith, is made in two pieces (R and S). The grooved pulley (S), or driving sprocket where chain drive is employed, is mounted in a bronze bushing (BS) which runs freely on the portion of the drive shaft keyed to the armature. The driving pulley imparts motion to the armature shaft through the intermediary of a star-shaped spring having four arms (MM and NN), which bear heavily against a loose friction disc (W), the latter making contact through a friction material (P) with the pulley (R) which is keyed to the armature shaft.

DYNALUX GENERATOR DISASSEMBLED, SHOWING CLUTCH AND CUT-OUT

Care of the Driving Pulley.

For low and medium speeds, the drive is positive and without slipping from the pulley to the armtaure shaft, but above a predetermined speed the weights (MM) at the ends of two of the arms of the star-shaped spring tend to straighten out under centrifugal force and thus relieve the pressure between the pulley and the driving disc. This allows a certain amount of slippage to take place, and at higher speeds the other weights (NN), which are lighter, also straighten out and release the pulley entirely. Of course, as the speed is decreased the operation is reversed and the drive is taken up gradually and without shock.

As there are no moving parts in the declutching apparatus—no joints or hinges, etc—it should require very little attention; occasional inspection to make sure that the device is operating properly, however, is a wise precaution. Should it be found necessary to increase the charging rate of the dynamo, or to obtain positive drive up to greater speeds, this can be accomplished in a simple manner by adjusting the releasing mechanism of the pulley. For adjustment, it is necessary first to remove the combined cap screw and oiler (T) at the end of the shaft. This will permit the key washer (KW) to be removed, exposing a castellated nut (U), which should be screwed up one or two notches, as the case may be, to increase the tension on the governor springs and permit the drive to remain positive at higher speeds. As the device is set at the factory, the driving ratio which obtains is approximately 3 to 1 over the whole range of engine speeds. The only lubrication which is required in the declutching mechanism may be applied through the combined cap screw and oiler (T) at the end of the shaft, a few drops of fine oil about once a week, according to the amount of use the device is given, generally being sufficient.

Centrifugal Circuit Breaker

The circuit breaking device in the Dynalux generator is mounted at the commutator end of the shaft and is completely covered by the outer casing of the machine. The removal of the casing renders the brushes, the commutator and the cut-out instantly accessible. The cut-out operates on the centrifugal principle, its weights having been proportioned to close the circuit between the dynamo and the battery when the voltage of the two is approximately the same. As a result, sparking and arcing at the contacts is practically eliminated.

The construction of the device is simple, a weight (G) being mounted at the end of a spring member (B), which rotates with the armature shaft. When a predetermined armature speed is reached, the weight tends to assume a position in line with the fastening at the other end of the spring, and in doing so it moves a second spring (H) through a hardened steel button (C) bring-

Digitized by Google

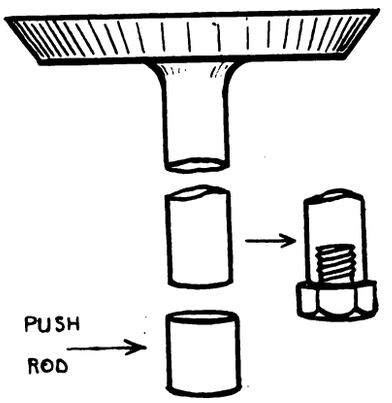
ing contacts on the second spring against two fixed contacts (FF), which are stationary; the hardened steel button (C) acts as a bearing.

Cut-Out Adjustments Easy.

Although the cut-out has been found by experience to operate effectively for long periods without inspection or adjustment, it should be examined from time to time, for upon its proper operation much depends. Adjustment of the contacts should not be attempted, except after long service, for they are set at the factory to close the line at the proper time and will not require to be touched for at least a season. Occasionally, however, the contacts may be cleaned with the aid of two pieces of very fine emery cloth glued to opposite sides of a piece of thin Bristol board. If adjustment appears necessary, it may be made by setting up the screws (FF) which mount the contacts. Care should be taken to see that proper contact is made when the armature shaft speed is increased and that the circuit is broken when the engine is stopped. In no case should the contacts be set closer than will permit a thin business card to be passed between them.

Where Lubrication Is Needed.

Owing to the fact that the armature is carried in ball bearings, very little lubrication will be required, a few drops of fine machine oil placed in the oilers about once every 1,000 miles being sufficient. The only other part which should be oiled frequently, say about once a week, if the car is driven a great deal, is the free portion of the declutching pulley, which is fed through the combined cap screw and oiler (T) at the end of the armature shaft.



Instructions for the care of commutator and brushes such as have been given in previous articles apply also in this case and consist, briefly, in maintaining a brownish glaze on the commutator through infrequent and minute applications of fine vaseline applied with a small piece of felt while the instrument is running. Accumulations of foreign matter which cause poor commutation may be removed by very light applications of No. 00 sandpaper. The brushes should be examined from time to time to make certain that they touch the commutator properly. After continued service, they will require to be replaced, though the operation is neither difficult nor does it entail great expense.

The Location of Troubles.

Failure to generate in the Dynalux system, as in very nearly all other systems, generally can be traced to broken wires, short circuits or poor commutation, the remedies for each of these troubles being made plain by the trouble itself. Systematic search for the cause of trouble is the only satisfactory means to employ, and as quickly as one part has been examined and found correct that part should be put into its original condition before the next is attacked. Only in this way can confusion be obviated and ultimate satisfaction be obtained.

Lengthening Short Valve Stems.

If the repairman had to repair new cars only, he would have a comparatively easy time, but the time when he must show his skill and ingenuity is when an "old crock" is overhauled. One of the unmistakable signs of old age can be found in their teeth, so to speak—that is, the valve push-rods. A worn push-rod without any means of adjustment prevents proper digestion of the carburetted gases, as the valves open late and close early. One of the most general methods of taking up the play between the valve and the push-rod is to interpose a cap or thimble over the latter, when the tension of the valve spring is sufficient to hold it in position.

METHOD OF LENGTHENING STEMS

Sometimes this method is not possible, especially if the push-rod head is flush with the guide. In such cases there are two alternatives — either fit new valves with longer stems or lengthen the stems of either the push-rod or the valve. Reference to the accompanying sketch will make clear the method of performing such a job. First drill and tap the stem for a standard machine screw and screw same in position. The two parts should then be brazed together and thoroughly cleaned of any brass and the sides of the hexagon head rounded off. If it is desired to harden the new ends of the valves this easily can be done with a little cyanide of potassium, in the usual way.

England Straining for "Home-made" Fuel.

Having become properly incensed at the laxity of British inventors and chemists in failing to concoct or otherwise produce some form of "home-made" fuel that will make Great Britain independent of the necessity of importing "petrol," which necessity, it is pointed out, lays the nation open to the possibility of dire catastrophe in the event that the seaports should be blockaded by a hostile fleet, the Royal Automobile Club at length has set on foot a movement calculated to assist in the production of a "petrol" alternative other than kerosene or paraffin or a derivative of petroleum. Incidentally, one of the British automobile journals has lent its support to the movement by offering a prize of $500 for the best performance under R. A. C. supervision, of a car on a "home-produced fuel suitable for internal combustion engines (other than a product of petroleum), whether liquid, solid or gaseous, provided, of course, that such fuel is something reasonably practicable and that it is possible to become a marketable product within a reasonable time."

Philadelphia Club Establishes Garage.

To accomomdate its members, the Automobile Club of Philadelphia has established a garage on 23d street, below Market street, where there has been made provision for the handling of cars in an up-to-date manner; the building, when fully completed, will be of three stories and will afford a capacity for 350 cars. At present the first floor only is in use. Separate quarters are provided for white and colored chauffeurs. The garage management is vested in Powell Evans, chairman, Robert P. Hooper, Winfred J. Foss, S. Boyer Davis and W O. Griffiths.

To Save "Cops" from Cold Feet.

Indianapolis, which scarcely requires the abbreviation "Ind." behind it to make its identity known, is nothing if not progressive. The city has taken pity on its much abused traffic policemen and hereafter some of them, at least, will go to their homes dry shod and with feet less like the proverbial lump of ice. So that 12 traffic regulators, stationed at as many downtown intersecting streets, may not get cold feet in the literal sense of the words, the city has appropriated $700 for the purpose of installing small steam-heated platforms, upon which the policemen may stand during the hours of their vigils when the thermometer registers something less than 100 in the shade.

Holding Round Shaft In Vise.

A round shaft having a machined surface can be held solidly in a vise if a piece of emery paper is wrapped around the shaft before being held in position; at the same time prevent the shaft from damage.

In the RETAIL WORLD

W. L. McQuerry has opened a garage in De Soto, Ia.

W. P. Harman is about to open a garage in Mena, Ark.

John C. Stolt plans to establish a garage in Nicollet, Minn.

Claude Andrews is building a garage in Union City, Tenn.

Peddycort & Lahr have opened a garage in Cheyenne, Wyo.

Ransom J. Pearce has opened a garage in Houghton, Mich.

Ben Spahnoli of Richmond, Cal., has let the contract for a garage.

Ralph Hopkins is about to build a garage, 51 x 60 feet, in Colfax, Ia.

Frank Schleeter plans to build a garage, 80 x 150 feet, in Galva, Ia.

W. E. Baumer of Big Arm, Mont., is about to open a repair shop.

Peter Garnier is to built a garage in Palms, Cal. It will cost $6,650.

J. K. McLain is preparing to build a garage in Excelsior Springs, Mo.

The Jones Cycle and Automobile Co., of Portland, Ind., has been dissolved.

The Star Auto Co., of Pella, Ia., plans to build a new garage and salesrooms.

Frank L. Seaker and Elmer Curtis have opened a garage in Gouverneur, N. Y.

The Weiler Auto Co. has opened up in Bay City, Mich., at 905 Saginaw street.

Otto Bauman intends to erect a brick garage, 50 x 100 feet, in Lake Wilson, Minn.

Aldege Chaussee has taken over the Geo. A. Schott garage in New Bedford, Mass.

O. E. Olson has purchased the garage and repair shop of John Odegard in Pekin, N. D.

Fred and Walter Taylor plan to start an automobile livery in Junction City, Kan.

G. R. Spencer of Odebolt, Ia., has commenced the construction of a garage, 40 x 80 feet.

J. W. Mooman has sold his interest in the Urbana (Ill.) Auto Co. to his partner, John F. Miller.

Timothy Lynch of Glens Falls, N. Y., is fitting up a garage in Warrensburg, in the same state.

Herman Herr has sold his interest in the Abilene (Kan.) Garage to L. S. Turner of Kansas City.

H. A. Saunders of Bryan, Tex., has sold the Imperial Garage to O. S. Johnson and Henry Ronde.

The Creamer & Davidson Co., of Rochester, Ind., is about to build a garage; it will cost $10,000.

Lon Gephart has opened a repair shop in New Castle, Ind. It is located at 131 North 11th street.

M. H. Taylor has opened up in Elmira, N. Y., at Gray and State streets; the style is Taylor's Garage.

W. H. Davis of Houston, Tex., is about to open a garage; several Cuero men are associated with him.

The Frank Tuschen Garage in Watertown, Wis., has been taken over by Felix and August Knospe.

The Jackson Motor Car Co., of Boston, Mass., has established a service station on Haywood street, Cambridge; J. L. Judd is manager.

The Detroit (Mich.) Hupmobile Sales Co., now at 730 Woodward avenue, is about to remove to newer and more up-to-date quarters at Willis and Woodward avenues.

L. M. Barr, who has been a publishers' representative in Detroit, and F. C. MacLeod have formed a Ford agency in Lima, O. The style of the concern is McLeod-Barr Sales Co.

The Transcontinental Motor Co., of Phoenix, Ariz., has taken over the Arizona Motor Co. F. A. Carr, the Arizona manager, remains with the new organization; the company has taken the Krit agency.

Howard D. Graves, formerly a salesman in Hartford, Conn., for Brown, Thomson & Co., has entered the trade for himself; he has the Henderson agency in that city. Temporarily he will be located at 19 May street, but later will occupy a building on Allyn street.

The Turnbull Automobile Co., of Willimantic, Conn., has purchased for garage purposes the Beckwith factory on Chestnut street, Norwich, in the same State; accommodations will be provided for 150 cars. F. J. Wood, of Willimantic, will have charge of the repair work.

Under the style A. D. Bothne Co., a new company has entered the selling field in Des Moines, Ia. A location has been secured in the Capital City Commercial College building at 10th and Walnut streets; Great Western cars will be stocked. A. D. Bothne is head of the business.

W. R. Dean, who recently went to Spokane, Wash., from the East, has arranged to handle the Stevens-Duryea line in that city; December 1st, he will take possession of the building at First avenue and Maple street, now occupied by the Pacific Motor Car Co. Plans of the latter concern are indefinite.

The Van Vliet-Bradt Co. has been organized in Des Moines, Ia., with several prominent business and automobile men as backers, and will deal in Moon cars at 918 West Locust street; the capitalization is $10,000. The officers are: President, W. E. Moyer; vice-president, W. J. Bradt; secretary and treasurer, C. G. Van Vliet.

Hunter-Hammond Auto Co. is the style of a new business in Indianapolis, Ind. It will have the Reo agency for the State of Indiana. The company is composed of F. Ellis Hunter, formerly with the Gibson Auto Co., and Harry L. Hammond, formerly sales manager for the Archey-Atkins Co. Pending the vacation of salesrooms at 517 North Capitol avenue, the business is located at Capitol avenue and Michigan street.

J. K. Gewinner, as president and general manager, and Marshall C. Johnson, as secretary and treasurer, have combined their names in the Johnson-Gewinner Co., which just has opened for business in Atlanta, Ga., at 124 Peachtree street and 83-85 North Forsyth street. They will deal in accessories and supplies, the completeness of their lines being indicated by the fact that an automobile millinery and clothing department will be maintained. Also, it includes a Bosch magneto agency.

The Wallace Automobile Co., 332 North Broad street, is a new entry in the selling field in Philadelphia, Pa. It has taken the agency for Pope-Hartford cars and Modern delivery trucks. The officers are: President, William M. Brownback; vice-president, H. B. Pearson; secretary and treasurer, Robert Wallace; the latter will conduct a garage and service department at 206-10 North 21st street. Robert M. McCormick, formerly a Regal salesman, is connected with the selling end of the new business.

HAMLIN WINNER OF RACE ACROSS ARIZONA DESERT

Covers the 511 Miles from Los Angeles to Phoenix in Eighteen Hours—Campbell Leads San Diego-Phoenix Chase.

Desert sands and mountain heights never were conducive to the production of speed, but when all is said and done, when the difficulties and the length of the route, and the fact that much of the travelling was done in the hours of darkness are considered, the speed of Ralph C. Hamlin, who drove a Franklin car over the 511-mile Los Angeles-Phoenix course at an average rate of 27.8 miles an hour, certainly is "going some" and entitles him to the honors which he won. The next best time made in the fifth annual desert road race, which started in Los Angeles on Saturday evening last, 26th inst., and finished in Phoenix (Ariz.) on the afternoon of the Monday following, was that of Charles Soules, who piloted a Cadillac and finished 45 minutes later than Hamlin. His elapsed time was just 18 hours.

The race, as has been the case in previous years, was run under the auspices of the Maricopa Automobile Club. The contest was run in two stages, the first to Yuma, where the contenders arrived on Sunday morning, and the second from Yuma, which the contenders left early Monday morning, to Phoenix. Twelve lined up for the start on Saturday evening—S. A. McKee (Cadillac), W. F. Pipher (American), Charles Soules (Cadillac), W. T. Brunell (American), A. G. Faulkner (Simplex), Leonard Jones (Hupmobile), Wm. Bramlette (Cadillac), Louis Nikrent (Buick), Ralph Hamlin (Franklin), Fred Fuller (National), Charles Bigelow (Mercedes), and C. M. Floersheim (Schacht). William Carlson (Winton), who was entered, did not start.

McKee, in the Cadillac, led off and the others followed at five-minute intervals. Soules was the first to arrive at Yuma, but the best time was made by Hamlin, who covered the distance of 304 miles in 10:47 against 11:02 made by the Cadillac driver. Faulkner in the Simplex was third, his time being 11:37. Louis Nikrent went into the ditch at Bloomington and wrecked the Buick, which naturally put him out of the running. Brunnell, in one of the Americans, smashed a wheel, just outside of Los Angeles, which delayed him for several hours.

At Yuma, the contenders met 22 drivers who were competing in the San Diego to Phoenix road race, which was promoted by the San Diego Automobile Dealers' Association, after it had been definitely decided that the Los Angeles affair would not pass through San Diego, as has been the case with the four previous contests. The San Diego faction, which had left the starting point at the same time as the Los Angeles racers, arrived at Yuma earlier, as was natural, since the distance traveled is not so great. A battle royal ensued between the two factions for the remainder of the long race.

Of the Los Angeles drivers, Hamlin made the best showing, and checked into Phoenix Monday afternoon, after having covered the distance in 18 hours and 45 minutes. As was before stated, Soules took second place, while third position went to Fred Fuller in a National, who finished in 20 hours and 10 minutes. Their performances net both the leaders trophies, and a goodly share in the $6,000 prize money, the remainder of which goes to Fuller.

The race from San Diego was won by D. C. Campbell in a Stevens-Duryea. Second place went to W. E. Ferguson in an Apperson, and third to R. L. Greer, who drove a Mitchell. A similar cash prize was divided between the first three men.

Grant Stars at Rockingham Park.

By capturing two of the five numbers of the twice-postponed racemeet of the Salem (N. H.) Motor Club, Harry Grant (Stutz) played the star part when the program finally was carried out on Tuesday last, October 29th. Grant won the one-mile time trials, covering the distance and setting a ned local track record at 57⅗ seconds. He also won a three-cornered match race which went for 25 miles, completing the distance in 21:03⅕ and leading home LeCain (Stutz) and Basle (Jackson). The other honors were shared by Harry Cobe (Jackson), who completed a ten-mile free-for-all in 10:54⅘, Jack Le Cain (Stutz), who accounted for a 25-mile free-for-all in 26:13, and George W. Downes (National), who made the best showing in the one-mile time trials for amateur drivers by completing the circuit in 1:05.

Two Dealers Suspended by A. A. A.

For violation of that rule of the A. A. A. contest board which prohibits advertising as the performances of stock cars the showing made by cars entered in non-stock car contests, the Pittsburgh Mercer Auto Co. has been suspended until January 1st, 1913. The George C. Brinkman Motor Car Co., which handles Nyberg cars in St. Louis, also has been suspended for a like period for failure to have a Nyberg which they had entered in the Universal Exhibition Co.'s races, September 29th and 30th, at the track to compete.

WET TRACK MAKES SLOW SPORT AT HARTFORD MEET

Grennon Takes Three of Six Events and Ties With Kyle in a Fourth—Menenghetti a Lesser Light.

Probably if the Charter Oak Park track, at Hartford, Conn., had not been soaked and slippery from the rains of the days preceding, Joe Grennon, who drove the Mercer in the meet that was staged there by E. A. Powell on Saturday last, 26th inst., would not have been able to bag three of the six competitive events which graced the program, and to tie a fourth. As it was, however, the drivers of the heavier cars "played safe" to avoid skidding, and as a consequence Grennon took a three-mile free-for all, a single mile free-for-all and a ten-mile Class E event and finished neck and neck with Harry Kyle (Pope) in a ten-mile free-for-all. The five-mile free-for-all handicap went to Louis Menenghetti, who further distinguished himself by completing a single mile time trial in 57⅘ seconds, driving a Fiat. Harry Kyle (Pope) took a five-mile contest for cars with displacements of under 451 inches, completing the distance in 6:20, and leading home Henri Hickman in a Mercedes, who had trailed him for the whole distance. The summary:

Five miles, for cars with displacements of under 450 inches—Won by Harry Kyle (Pope); second, Henri Hickman (Mercedes). Time, 6:20.

Three miles, free-for-all—Won by Joe Grennon (Mercer); second, Harry Kyle (Pope); third, Henri Hickman (Mercedes). Time, 3:16⅗.

One mile, time trial—Louis Menenghetti (Fiat). Time, 0:57⅘.

Ten miles, free-for-all—Dead heat between Harry Kyle (Pope) and Joe Grennon (Mercer); second, Henri Hickman (Mercedes). Time, 10:02.

One mile, free-for-all—Won by Joe Grennon (Mercer); second, Harry Kyle (Pope); third, Henri Hickman (Mercedes). Time, 1:08.

Five miles, free-for-all, handicap—Won by Louis Menenghetti (Fiat); second, Joe Grennon (Mercer); third, Harry Kyle (Pope); fourth, Henri Hickman (Mercedes). Time, 5:12.

Ten miles, for cars with displacements of under 601 inches—Won by Joe Grennon (Mercer); second, Harry Kyle (Pope); third, Henri Hickman (Mercedes); fourth, Louis Menenghetti (Mercedes). Time, 10:22.

One mile, time trial—Crawford (Fiat). Time, 1:15.

"AROUND LAKE MICHIGAN" PROVES GRUELING CONTEST

But Few Survive and Only Three Retain Clean Scores—Roads and Rain Try Men's Souls and Cars' Metal.

"Never again!" with both hands up, is the substance of the opinions of the ten contenders who finished the 1,070-mile course of the Around Lake Michigan reliability tour of the Chicago Motor Club, which was brought to a close Sunday evening last, 27th inst., when the weary drivers piloted their machines into the Windy City. Doubtless, were either of the five starters who were unable to finish the course asked for an opinion, a statement equally as strong, if not stronger, would be forthcoming. Of the ten who survived the grind, for grind it was from start to finish, over roads, or so-called roads, hub deep in either sand or mud, so that the use of high gear was impossible for the greater part of the time and on occasion it was absolutely imperative to run for prolonged periods in low gear, and in the face of a chilly and almost incessant downpour, which made the bad roads even more soul trying, but three were able to pull through without incurring penalty. They were Gustave Moncmeier, who drove a Staver in the touring car class, and Joseph Wicke and F. Salisbury, both of whom drove Moline cars in the roadster class. Moncmeier's performance nets him the Stalnacker trophy, and the lots will decide which of the two winning Moline drivers is to receive the Luce trophy, the award in the roadster division. The Moline drivers naturally carried off the C. M. C. trophy for the best team work.

ALLEGED PUBLIC HIGHWAY NEAR LAPEER, MICH.

KAVANAUGH (MIDLAND) IN THE WILDS OF MICHIGAN

"ROAD" BETWEEN NEWBERRY AND ST. IGNACE, MICH.

TAYLOR (R. C. H.) "DRAWING" WATER NEAR ST. IGNACE

Of the 15 who left Chicago on Monday morning, October 21st, R. B. Gray (National) and M. M. Luce (Velie) dropped out before Escanaba, the night control, was reached on Tuesday. R. E. Maypole (Stutz) dropped out during the trip from Escanaba to Newberry, having broken a wheel. A. Monson (Bergdoll) received another 9 demerits for taking on water outside of controls, which brought his score up to 170 points, and K. Taylor in the R. C. H. received two black marks for like cause. T. R. Rooney (Bergdoll) and Claude Anderson (Stutz) brought their penalizations up to 30 and 189 points, respectively, for road work and for lateness at the controls. H. Branstetter (Kissel) burned his cultch and dropped out before the 170 miles to Newberry were covered.

The 60-mile run to Mackinaw City, which was made on the fourth day, occasioned the downfall from the perfect-score class of J. Hanson (Case), who received 2 points for stalling his motor, and A. M. Robbins (Abbott-Detroit), who received 3 for taking on water.

Traverse City, 109 miles from Mackinaw City, was reached on Friday evening. Not-

Digitized by Google

withstanding the fact that during the run better roads were encountered than on the days previous, penalties were meted out to Hanson (Case), who received 38 points for road work when he lost a wheel; Monson (Bergdoll), who had 52 black marks added to his score when a pushrod broke, and Claude Anderson (Stutz), who received 57 points for time lost in repairing springs. B. Park in the R. C. H. failed to make the control in time and was eliminated.

During the run from Traverse City to Grand Rapids, Brolley was assessed 3 points for adjusting the clutch on his Velie; J. Hanson (Case) received 9 points for work on a broken spring; Monson (Bergdoll) annexed 64 points for a variety of trouble, and A. M. Robbins did not arrive for hours after the other cars had checked in.

The best roads of the trip were encountered on the last day's run, from Grand Rapids to Chicago, 217 miles, when the tour became a veritable joy ride. When the cars entered Chicago the scores were as follows:

Touring Car Class.

G. Moncmeier (Staver)	0
J. Brolley (Velie)	5
G. Knudson (Staver)	8
J. Hanson (Case)	50
M. Monsen (Bergdoll)	298
A. M. Robbins (Abbott-Detroit)	1,400
B. Park (R. C. H.)	Withdrawn
R. B. Gray (National)	Withdrawn

Roadster Class.

J. Wicke (Moline)	0
F. Salisbury (Moline)	0
T. Rooney (Bergdoll)	325
Claude Anderson (Stutz)	2,435
K. Taylor (R. C. H.)	Withdrawn
M. Luce (Velie)	Withdrawn
R. Maypole (Stutz)	Withdrawn

Glidden Finishes His Own Tour.

Escorted by a caravan of motorists, Chas. J. Glidden rode into New Orleans on Saturday afternoon last, 26th inst., and thereby completed his 1,600-mile tour from Detroit to the Gulf of Merico. Glidden, who occupied a Maxwell car, left the "Automobile Capital" on Monday, October 14th, accompanied by a second Maxwell car, piloted by A. V. Davis.

All went well throughout the first half of the journey—in fact, until after the tourists left Memphis, Tenn. Bad weather then set in and so hampered progress that on Tuesday, 22nd inst., the party was forced by roads that were almost impassable to cut short the day's journey and lay over at Clarksdale, Miss. The following day, however, the 75 miles to Lexington were completed, and on Thursday another 100 miles to Jackson were reeled off. The 200 miles between Jackson and Baton Rouge, La., were covered on Friday, and the remaining 75 miles to the Crescent City on Saturday morning. It took Glidden 12 days to complete the run.

TWO ACCIDENTS CAUSE CUT IN EVENTFUL YORK PROGRAM

Both the Result of Bursting Tires—Minker and Freitag Gather Glory Before the Meet is Called.

Two accidents, both the result of bursting tires, and one of which was sufficiently serious to warrant calling off the remainder of the program, marred the race meet which was staged on the half-mile track on the York Fair grounds on Saturday last, 26th inst., by the York (Pa.) Motor Club. The first accident occurred when Schneider (Pratt) lost a tire in the five-mile free-for-all, which resulted in his going through the fence. Happily no real damage was done. The second accident occurred in precisely the same manner during the running of the ten-mile free-for-all, when Gilliard's Pullman burst a tire and overturned, injuring both the driver and his mechanician, George Ickes, so seriously that their removal to the hospital was necessary. Two of the four numbers that were run off before the accident occurred went to Minker in a Kline; the others were won by Freitag (Mercer) and Richley (Buick), respectively. The summary:

Five miles, for cars with displacements of under 301 inches—Won by Freitag (Mercer); second, Lambright (Ford); third, Anderson (Pullman). Time, 6:29⅗.

Five miles, for cars with displacements of under 451 inches—Won by Minker (Kline); second, Anderson (Pullman); third, Richley (Buick); fourth, Freitag (Mercer). Time, 6:03⅕.

Five miles, for cars with displacements of under 601 inches—Won by Minker (Kline); second, Gillard (Pullman); third, Oden (Simplex); fourth, Anderson (Pullman). Time, 6:08⅗.

Five miles, free-for-all handicap—Won by Richley (Buick); second, Lambright (Ford); third, Minker (Kline); fourth, Freitag (Mercer); fifth, Oden (Simplex). Time, 7:09⅘.

Wishart Cleans Up at White Plains.

All save one of the five events which were run on the half-mile track at the Westchester County Fair Grounds, White Plains, N. Y., on Saturday last, 26th inst., were easily accounted for by Spencer Wishart, who, as usual, piloted a Mercer. The event which escaped him fell to F. E. Wood (Mason), who covered five miles in 6:37½. It escaped Wishart because he was not a contender. Wishart's victories comprised a five-mile event for cars with displacements of under 451 inches, which he completed in 5:23¼; a single mile trial, covered in 1:11; a ten-mile free-for-all, in which his time was 12:45, and what proved to be the most interesting contest of the day, a five-mile free-for-all handicap, which he won in 6:21 from scratch. The summary:

Five miles, for cars with displacements of under 300 inches—Won by F. E. Wood (Mason); second, Thomas Costello (Maxwell). Time, 6:37½.

Five miles, for cars with displacements of under 451 inches—Won by Spencer Wishart (Mercer); second, Paul G. Thebaud, Jr. (G. J. G.); third, F. E. Wood (Mason). Time, 5:23¼.

Ten miles, free-for-all—Won by Spencer Wishart (Mercer); second, Paul G. Thebaud, Jr. (G. J. G.). Time, 12:45.

Five miles, free-for-all, handicap—Won by Spencer Wishart (Mercer), scratch; second, Paul G. Thebaud, Jr. (G. J. G.), 15 seconds; third, F. E. Wood (Mason), 45 seconds. Time, 6:21.

Sloan's Troupe Entertains Tennessee.

By accounting for two of the four competitive events which were included in the program offered by A. J. Sloan at Nashville, Tenn., Saturday last, 26th inst., Joe Nikrent earned the better part of the honors of the meet. Nikrent's victories, achieved in a Case car ,included the feature event of the day, a five-mile free-for-all handicap, and a match race in which he beat out Ulbrecht, also in a Case. Disbrow drove the Simplex to victory in a five-mile free-for-all and also covered a single mile in the reconstructed Fiat in 54 seconds. The Australian pursuit, which went for ten miles, went to William Endicott (Case). Summary:

Five miles, match race—Won by Joe Nikrent (Case); second, Ulbrecht (Case). Time, 5:12.

Ten miles, Australian pursuit—Won by William Endicott (Case); second, Ulbrecht (Case). Time, 9:38⅗.

Five miles, free-for-all—Won by Louis Disbrow (Simplex); second, William Endicott (Case). Time, 4:58⅕.

Five miles, free-for-all, handicap—Won by Joe Nikrent (Case); second, Ulbrecht (Case); third, Disbrow (Simplex). Time, 4:30.

Disqualify Two for Unsanctioned Racing.

Charles W. Canner, a registered racing driver who promoted and participated in various and sundry unsanctioned meets throughout the Middle West during the past few months, has been suspended by the contest board until January 1, 1915. F. V. Rickenbacher, who also participated in the meets which Canner promoted, was suspended until January 1, 1914.

CANFIELD PATENT DECLARED NOT BASIC

(Continued from page 6.)

the engine and in which fiber or soapstone soaked in lard formed the insulating material.

Judge Mayer considered that the evidence established that the "modern operative spark plug with porcelain insulation" was due not to Canfield but "was only made practicable through the joint efforts of the porcelain makers and the spark plug manufacturers." He found, however, another "fatal bar" to a judgment in favor of the Canfield interests, the "bar" consisting substantially of lack of prosecution by those who owned the patent. He pointed out that even the complainant in the present case, Mosler himself, had marketed a spark plug which infringed the Canfield patent as early as 1902 or 1903, and neither Mosler nor any other of those to whom the patent had been assigned took any action to establish its validity during a period of 11 years. He, therefore, believed that the defendant and manufacturers of such spark plugs as those in question were justified in considering the Canfield patent of doubtful validity "by the inertia of the assignees of *this* patent, which non-action is strongly suggestive of lack of confidence in the validity of the patent." The court's decision in full is as follows:

The invention claimed relates to the means for igniting the explosive charge of gas or hydrocarbon vapor in internal combustion engines, such as are commonly used for the propulsion of automobiles and small boats and various other purposes.

This is now almost universally accomplished, in engines of the character referred to, by an electric spark which is formed at the proper instant between two electrodes which are situated within the explosion space of the engine and are connected with a suitable source of electric energy. It is contended that the invention covered by the patent in suit relates to ignition devices of this kind as applied to compression engines, in which the charge of gas or vapor is compressed before ignition. As is well known, there are two systems of electric ignition—the "make and break" and the "jump spark." The invention here claimed belongs to the "jump spark" system.

To understand the problem of ignition which Canfield endeavored to solve, it is necessary, of course, to ascertain, if possible, the state of the prior art.

Canfield began his experiment in 1895 at Manistee, Mich., applied for letters patent in August, 1897, and obtained them in October, 1898

Dugald Clerk is regarded by many as the leading expert in the world on internal combustion engines. His work, "The Gas and Oil Engine," was accepted on this circuit as authority in the noted Selden patent litigation, and he is spoken of as one who has testified "with admirable clearness" as an expert.

The eighth edition (1896) of the work referred to is in evidence.

From Mr. Clerk's observations, it abundantly appears that the problem of ignition in the compression engine was far from solution, that the electric methods were "at best uncertain" and that much remained "to be accomplished before flame is as completely and effectively under control as steam." (Clerk's "The Gas and Oil Engine," p. 202, 05, 225.)

Canfield manifestly understood the difficulties referred to by Clerk and set about to overcome them. In March, 1895, Manistee Iron Works Company, apparently a reputable concern, began to build an engine at the instance of Canfield. This engine was finished in the summer of 1895 and had at first a plain head with fiber plugs. In this original head, experiments were made with mica, fiber and soapstone insulators.

Later—in February, 1896—other heads (Complainant's Exhibits: Engine Heads, Feb., 1896, R. & L.) were made by the Manistee Works, the engine then having, in the heads, soapstone plugs with recesses around the electrodes, and this engine with these heads was operated in the shops of the Manistee Works for about thirty days in the spring of 1896.

The evidence satisfactorily establishes that the engine shown in complainant's exhibits (photographs Nos. 1, 2, 3 and 4) was used in March, 1896, with the heads referred to (Engine Heads, Feb., 1896, R. & L.) and that Canfield suggested and directed the making of the insulators in these heads around the electrodes as shown in the exhibits.

These dates are important because of the defense of prior use of a plug, called in this suit the Raabe plug. The evidence as to this prior use is, to say the least, not convincing but, in any event, the Canfield structure was a month ahead of the Raabe plug.

We must now examine the claims of the patent, which are as follows:

1. In a gas, oil or vapor engine igniter or sparker a recess or counterbore around the electrode or electrodes and above its or their sparking-points when said electrodes are used vertically, for the purpose of preventing an injurious accumulation of the products of combustion or other foul matter on the insulation of said electrodes, substantially as and for the purpose set forth.

2. In a gas, oil or vapor engine igniter or sparker a recess or counterbore of such size and depth as to prevent the explosive mixture used in the cylinder from circulating into said counterbore or recess far enough to come in contact with its deepest part around the electrode or electrodes at or near the point where said electrode or electrodes leave the insulator to enter the cylinder or firing-chamber, for the purpose of preventing an injurious accumulation of the products of combustion or other foul matter on the insulation of said electrodes, substantially as and for the purpose set forth.

Complainant differentiates these claims, urging that Claim 1 applies to all of the figures of the patent drawings, not only to those in which that part of the electrode within the recess is bare but also to those in which that part of the electrode within the recess is itself covered with insulation, while Claim 2 is applicable only to those forms in which that part of the electrode within the recess is bare. It is alleged that six spark plugs (Complts. 1-6) infringe and under this interpretation all would infringe Claim 1 and four (Complts. 1-4) would infringe Claim 2.

This construction of the claims seems to me to be strained and antagonistic to the clear import of the language employed; and if there be any doubt as to the meaning of that language, resort to the file wrapper will resolve that doubt in favor of the contention of defendant, that there is nothing to limit Claim 2 to a tubular wall of insulation spaced from the electrode.

Briefly stated then, Canfield believed that he had found a method of insulating the electrodes of gas, oil or vapor engines that would not foul injuriously, but be at all times in reliable working order, and he claimed as his invention the recess or counterbore around the electrodes, deeper than it was made, and upon that claim his patent must stand or fall.

Defendant insists that this claim was fully anticipated in the prior art, and he has introduced in evidence a considerable number of prior patents and publications. The only one which is debatably close is the structure shown in "Schotteler's 'Die Gasmaschine.'"

Fortunately I am aided in this case by the tangible existence of what Judge Hough has called that wholly ideal and fictitious person, "the man skilled in the art." (172 Fed. Rep., 923.)

If the solution of the problem was not revealed to Dugald Clerk by "Die Gasmaschine," I am sure I cannot discover it. "Dis Gasmaschine" was published in 1890. Clerk wrote of the problems of ignition in 1896. He was undoubtedly thoroughly familiar with Schlottler's work, for in his preface to his first edition (1896) he expresses his indebtedness to Professor Schottler, among others. In his 1896 book, Clerk shows that he has continued to study and analyze Schottler's contributions to this art and science (pp. 180, 253, 256), and, surely, if "Die Gasmaschine" had made disclosure, Clerk would never have indulged in the observations hereinbefore referred to.

We thus find Canfield in 1895 having an idea which had not been anticipated. Did that idea take practical form so as to enable the man "skilled in the art" to make an operative structure, and did that idea, as stated in the patent, disclose the information necessary to the manufacture of the modern alleged infringing spark plug (Exhibits 1-6)?

There is no disclosure in the patent of what material the insulation should be nor how to keep it tight nor how to prevent the destruction of the plug by the heat.

As defendant's expert says:

It is very evident from the specification that the patentee's conceptions were theoretical merely, and that he viewed the matter from the mechanical side only, and had no idea whatever of the electrical nature of the problem. Thus the matter which is, most of all, fundamental, and without which no structure could succeed—namely, the nature of the material—is not referred to at all, and there is no insulating material known to me which could possibly be used successfully in the patentee's construction. Again, the fundamental matter of mechanical construction, such as the prevention of leakage, and the allowance for expansion, is neither referred to in the specification, nor provided for in the drawings. I refer here to the leakage of gases under the working pressures. Again, the patentee gives no information whatever as to how oil is to be prevented from working into and around the insulation, and, by carbonizing, destroying its insulating value.

Complainant's expert (distinguished in this art), in his prima facie testimony and prior to the testimony as to the use of soapstone, suggested porcelain and mica as the insulating material. It is clearly shown that mica was impracticable. So was fiber. So was soapstone until soaked with lard, baked and then shrunk in.

I am satisfied that the theory of defendant's expert as to porcelain, is right. He testified that if porcelain is to be exposed to high temperature it cannot be practically made in large masses (such as Canfield's patent may be deemed to have suggested), without certain destruction by the heat. (D. R. 132.)

Defendant's expert explains the success of the modern spark plug as follows:

The use of porcelain as an insulator in the modern spark-plug is successful at the present time, only becouse the joint efforts of the porcelain makers and the spark-plug manufacturers have resulted in qualities of porcelains and modes of mounting which enable the porcelain to expand and contract freely and hold it in such a manner that the part clamped has a small mass to give rise to disruptive internal strains. . . .

Complainant's expert attempted to explain away these defects by saying (p. 392, C. R.):

I am of the opinion that porcelain could have been employed successfully in large masses without packing, if the method of construction had been used as that employed with the soapstone insulation, even in spite of its hard and brittle nature.

In other words, if the porcelain was soaked in oil, baked and then ground off and shrunk into the heads, as was done with the soapstone, the porcelain might have been made to work, but nothing of this nature is mentioned in the patent.

Defendant could not be expected to know anything about soapstone or shrinking it in or treating it with lard oil and baking it, all of which were necessary in the Canfield device, as none of this information was contained in the patent, but came out for the first time on the rebuttal proofs. Following merely the patent and what was known in the art at the time, defendant made an engine head (Defendant's Exhibit "Canfield's Cylinder Head"), also three porcelains such as shown in the drawings, which have been introduced as Defendant's Exhibits "Canfield Insulators" Nos. 1, 2 and 3, and tried them out exactly as described in the patent. As they were not shrunk into the head, but followed the patent exactly, they broke.

Further experiments were made by complainant, but these only served to confirm the contentions of defendant.

Further reference might be made to the testimony in support of defendant's position on this branch, but enough has been pointed out to indicate that the spark-plugs in suit (Exhibits 1-6) do not infringe

Digitized by Google

and that the patent must be limited to the particular forms which Canfield illustrated.

I am not unmindful of the argument that Canfield did his work in the early stages of the art to which his invention belongs, but spark-plugs, though called by other names, were known to the art, and had Canfield found the secret of an operative structure, he could have expressed it in simple terms. I think the evidence establishes that the modern operative spark plug with porcelain insulation was only made practicable through the joint efforts of the porcelain makers and the spark-plug manufacturers as hereinbefore described.

There is, however, another and, it seems to me, fatal bar to a decree in favor of complainant.

After Canfield's death (sometime prior to 1901), the patent was assigned a number of times until it was acquired by complainant in March, 1909.

As far back as 1901, the Torbensen Gear, Incorporated, was putting on the market, in a comparatively large way, the plug described in evidence as the "T. G. I. plug."
